As a result of these field plot studies, together with a detailed lime requirement survey, it was concluded that there is no one soil condition more prevalent in the humid region and possibly none

| Average Annual Yields per Acre | | | | | |
|--------------------------------|------------------|------|------|-------|--------------|
| Average of Three Soils | | | | | |
| | Clover & Timothy | Corn | Oats | Wheat | Rough-Field |
| | Hay | Bus. | Bus. | Bus. | Pounds Crops |
| Ground burnt lime 3793 | 49.5 | 37.2 | 23.3 | 2425 | 4281 |
| No lime | 1805 | 20.3 | 28.2 | 10.4 | 1399 |
| Limestone | 3867 | 49.3 | 46.1 | 23.2 | 2561 |
| Hydrated Lime | 3720 | 50.4 | 48.5 | 21.2 | 2603 |

(*) Weeds. (†) Average of two soils.

that has a greater controlling influence on the growth of crop-producing plants than soil acidity. This undesirable soil condition is a complex one, involving many factors which tend to arrest the normal functions of the soil.

The presence of toxic substances, both organic and inorganic, the absence of basic lime and decreased availability of essential plant food constituents, no doubt, all play a part in bringing about conditions unfavorable to the best development of the chemical, physical and biological properties of the soil. It has been shown conclusively that when some form of basic lime is applied in sufficient quantity to these sour soils the undesirable properties disappear and the soil will again become productive under proper management.

The Agricultural Lime Market

Prior to 1911 the major portion of lime sold by American producers for agricultural use consisted of burnt and hydrated lime. Since that time the trend has been toward the use of pulverized limestone to the exclusion of the more concentrated form. Thus in 1911, 770,954 tons of burnt lime, hydrated lime and pulverized limestone were sold by American producers for agricultural use, of

Lime for Sour Soils

By J. W. WHITE

which 77 per cent was in the more concentrated form. In 1926 a total of 2,147,610 tons of the three forms of lime was sold for agricultural use of which only 13.9 per cent in the more concentrated form and 86.1 per cent pulverized limestone.

In 1926 a total of 2,214,674 tons of agricultural lime was sold by producers, including the following percentages of different forms: burnt lime 5.9, hydrated 8.3, oyster shells 0.5, marl 2.5 and pulverized limestone 82.6. This tonnage of agricultural lime does not represent the total amount actually used for soil improvement, for a large tonnage of limestone road screenings is used, also considerable agricultural lime is sold by small unlicensed producers including by-product lime.

The keen competition in the sale of agricultural lime is shown by the fact that in Pennsylvania

Effect of lime on yields of soy-bean hay. The author is showing you the extreme yields from a limed and unlimed area—limed soil 6,972 pounds and unlimed soil 1,754 pounds of hay per acre. Pays to use lime, doesn't it?

102 firms are licensed for the sale of 177 brands of agricultural lime products. Agricultural lime is largely a by-product from industrial plants. Farmers of the Keystone State are using the following ten different lime products: pulverized limestone, oyster shells, precipitated lime carbonate, (by-products from chemical plants), marl, hydrated lime (high and low magnesia), burnt lump lime, ground burnt lime, blast furnace slag ("agricultural slag"), gypsum and waste lime from tanneries, gas plants, etc.

Relative Crop Producing Value of Three Forms

The Pennsylvania lime experiments have furnished valuable data on the importance of liming, and value of different forms in production of grain and hay. The summary table on the first

column of this page based on the average results of three widely different soils serves to show the importance of lime on eastern soils.

In the lime experiment the three forms of lime are applied on the basis of equal units of lime oxides in amounts sufficient to correct the initial lime requirement of the soil. All plots are uniformly supplied with

the same amount of fertilizers, so lime becomes the limiting factor. The above results show that there is no significant difference in the crop producing value of the three forms of lime. These data further emphasize the importance of lime in the rejuvenation of sour soils so abundant in our eastern states. Based on the average yields due to the three forms of lime, corn was increased 145 per cent, oats 56 per cent, wheat 127 per cent and hay from weeds to 3,793 pounds per acre.

Comparative Values of Limestone and Agricultural Slag (Blast Furnace Slag) in the Production of Hay

Within the last few years specially prepared blast furnace slag has been sold in several eastern states as a source of agricultural lime. This material is placed on the market at the present time in granular form prepared by running molten slag into cold water. The slag is broken down into small porous particles through the process of rapid cooling and becomes quite brittle. The lime is present in the form of calcium silicate equivalent to from 45 to 52 per cent lime oxide (CaO).

This new form of agricultural lime is now being studied at the Snow Shoe experiment fields on

| | Clover & Timothy | Soy | Ky. Blue-grass | Sweet Clover |
|----------------------|------------------|------|----------------|--------------|
| No lime | *617 | *651 | 3010 | 1599 |
| One ton limestone | 1666 | 1122 | 5651 | 2145 |
| One ton agr. slag | 617 | 634 | 4362 | 2096 |
| Two tons agr. slag | 1880 | 1105 | 4806 | 1711 |
| Three tons agr. slag | 1855 | 1117 | 5636 | 2548 |

(*) Weeds.

DeKalb soil. The experiments are arranged in four tiers of 50 plots each. From one to five tons of slag per acre are compared with an application of one ton per acre of pulverized limestone. The above data show the relative value of the two materials in the production of hay. Pounds per acre.

In the production of hay the heavier applications of slag have given yields comparable to that produced by one ton of limestone. In each case the four lime applications have given yields considerably in excess of the unlimed soil. The several applications of lime were applied in 1926. The above crops were harvested in 1928 except soy-bean hay which was produced in 1926.

A study of the above data serves to emphasize the importance of lime in our scheme of soil management as a means of paving the way for maximum return from the use of fertilizers. The several forms of basic lime when applied to the soil on the basis of equal units of lime oxides of similar fineness show the same value in crop production.

Orchards Need Lime

INABILITY to maintain a sufficient amount of organic matter in the soil, due to the failure of cover crops, is one reason why the vigor and productivity of many New Jersey orchards is impaired.

As a means of correcting this unfavorable condition, applications of lime are advised by Prof. A. J. Farley, New Jersey extension pomologist. The amount required can be determined by a soil test, which will be made without charge by county agricultural agents on request.

NEW MILK LAW

MANY erroneous ideas are afloat about Pennsylvania's new milk law, which goes into effect September first of this year. An article on page 29 of this issue is intended to answer such questions about it as have come to us. If there are any other questions we shall try to answer them. The time to get acquainted with the provisions of a new law is before it is enforced.

FROM LIFE

A MAN who loved his horses so much that he would not sell them died recently, leaving over 120 head on his farm. All were in good condition, though some of them were past the age of usefulness. Among them were many mature animals which had never worn harness. Just here somebody is pretty sure to say something about this man's folly; but is any manifestation of love and kindness folly? Was it not his privilege to love his well-bred horses, and was it anybody's concern if he refused to sell them?

WAYS WITH BULLS

AN Illinois writer presents two ways of scaring an angry bull and asks somebody to try them. We are not going to publish them for fear somebody will try them and find himself in a hospital or an even quieter place. The trouble with all such ways of dealing with a bull is that the bull doesn't wait to consider them but attacks suddenly and swiftly. Thus far in our bloody record of gentle bulls the faithful dog has been the most efficient help. And sometimes even the dog has been too late.

THE DREAM OF STABILITY

A READER calls attention to the fact that markets not affected directly by legislation are unstable as are grain and cotton markets. Certainly they are and in the very nature of things must be. For there is no such thing as complete stability in any market, nor can there be any such thing as long as conditions which influence men's minds about prices are variable. No thinking person wants complete stability in markets. If that were possible it would be possible to perpetuate low prices, and no class of producers would welcome any such thing. What all of us should want, and what both produc-

ers and consumers are entitled to have, is a market which freely reflects actual conditions and expresses them in terms of prices. Interference with such markets, no matter how benevolent its intent, has always resulted in more harm than good. That is the world's commercial experience, without a single notable exception, and experience is worth more than theory in this as in other things.

POWER TO REGULATE

LAST week the United States Supreme Court ruled that, under the packers and stockyards law, the Secretary of Agriculture has the right to prescribe reasonable rates of commission for the sale of livestock at public stockyards. The decision was the result of a suit brought by all the members of the Omaha Livestock Exchange, an organization which fixes uniform commission changes and which virtually controls the sale of livestock at that point. In all such cases it is proper that some public authority should have power to review rates and determine their fairness. This point having been determined by the Supreme Court the future rate problems will be merely as to their reasonableness, and all interests have the right to challenge that at any time in court or out of it.

FIRST LIVESTOCK FUTURES

THE first organized future trading in livestock was done on March 1st, when the contract market for hogs was opened at the Chicago stockyards. Trading on the opening day was not large in volume and only one packer appeared on the buying side. Hogs of standard light grade (170@210 lbs.) sold for March delivery at \$11.25 per cwt.; for April at \$11.65 and for September at \$12. Hogs of standard heavy grade (260@310 lbs.) sold for April delivery at \$11.15@11.25 per cwt. There was no trading in standard medium grade hogs, 210@260 lbs. The future of this experiment will be observed with much interest. If it is successful such trading may be extended to other livestock which may be sold by grade, such as feeder lambs for example. There is already much future trading in lambs but it is all done privately.

OBSOLETE?

CARPENTERS limit the amount of work they do in a day; bricklayers limit the number of bricks they lay in a day; paper hangers stop work when they have put on a certain number of rolls. The same policy is manifest in other lines but not in all others. In addition to limiting daily service or production organized labor is demanding a five-day week. At the same time farmers are urged to cut down their production. The reason is essentially the same in all cases—expectation of better wages or higher prices, which amount to the same thing. What has become of the old doctrine that mankind cannot enjoy more wealth by producing less?

THE WHEAT FORECASTS

WE have constantly contended that price forecasting is not a proper function of the Department of Agriculture or of any other official agency. The wheat market furnishes us a glittering example of the way official forecasters miss it when they attempt to "figger out," from statistics and past records of all kinds, what the future will be. Last year the Department, through its Bureau of Agricultural Economics, made several estimates of the probable future price of wheat. These forecasts varied from month to month but every one of them was away higher than the market proved to be. In August, for in-

stance, the official economists expected the cost of British purchases would average 45c per bushel above the average for the preceding crop year. In October they still expected prices to average higher by 35@40c per bushel. Then the Federal Farm Board, evidently relying on the Department's economists, issued the declaration that wheat prices were too low and announced loan bases supposed to be materially below what the price would actually be. Subsequent events have shown that neither the Department's economists nor the Board knew anything about the course of future prices, which have gone far below the Board's loan basis and still farther below the experts' forecasts.

Fortunately for themselves most farmers did not heed the forecasts of the economists but sold their wheat. At least the bulk of the wheat in this country was out of the hands of producers before the severest of the slump. Such experiences as this, and others which might be cited, should foreshadow the end of official forecasting. Congress, at the behest of Southern interests, has already ended it so far as cotton is concerned. Like prohibition might well be extended to other commodities, in fact to all of them.

FEDERAL WHEAT HOLDINGS

LAST week's wheat market was marked by declines, by heavy buying by the Grain Corporation and by recoveries from the extreme low prices. Export business continues below par but it should improve with lower price levels here and the passing of European stocks into consumption. Chairman Legge announced, February 27, that the Federal Farm Board controlled about 25,000,000 bushels of wheat—10,000,000 bushels bought outright, 8,000,000 bushels by loans and 7,000,000 bushels contracts for future delivery. The head of the Federal Farm Board deserves credit for making such a statement, but the public should not have to depend on occasional expressions of this kind. Regular statements should be made of all transactions of this public agency, and all of its agencies, as to wheat, cotton or any other commodity in which business is done. The soundness of such a policy of public information is so clear that it should require no argument.

FOR BEAUTIFUL HOMES

WE have known persons to do all sorts of things for which they were sorry afterwards, but we have never known one to regret planting a tree, a shrub or a flower where it would add beauty to his home or give comfort to his family. There is something in foliage which invites, soothes and inspires. And there is the instinct in normal people to hide the harsh lines of buildings and cover unsightly places with the curves, masses and colors of growing things. Individuals, communities or towns which obey the impulse to dress up their homes add something to the sum total of human happiness and much to the amiable weakness of justifiable self-esteem. In fact the effect on morale is officially recognized by at least one national farm organization which links its yard and garden contest with farm relief on the ground of it being a force for better times in agriculture. This is the American Farm Bureau Federation, which in announcing such contest or campaign proclaims it "a progressive movement in the interest of both the family and the community . . . a most worthwhile service to rural America." While we do not see eye to eye with the Federation in all things we can see how it may benefit agriculture by encouraging more pride in farm homes, increase the value of property and meet a crying need for the elimination of unnecessary ugliness.

Pennsylvania Farm Comment

By MILES HORST

FROM our corn growing counties come reports indicating that the germination of the corn stored in many cribs will be very poor this spring due to the early freeze the corn had last November when it still ran high in moisture. There is no need of any alarm about the seed corn situation, however, for in most communities cribs of good germinating seed corn can be found. But this is no time to take chances on one's own crib without first giving the corn a real germination test.

At least 3,000 baby chicks will be shown at the first Pennsylvania Baby-Chick show to be staged at Honesdale, April 2 and 3, so we are informed by Livingston Blauvelt, the very active manager of this event. These chicks will be shown in various classes and subclasses and fine cash prizes and cups will be awarded to the winners. The show is open to state-wide competition and those desiring to make entries are requested to do so early.

TWO of our Pennsylvania wool pooling associations have recently incorporated as cooperative organizations under the Pennsylvania Cooperative Act of 1929. This is in line with good business, especially in such cases as these two associations where the annual business runs into the thousands of dollars. Incorporation removes the personal liability of those charged with the duty of handling the business of the association in case reverses are encountered.

THE Philadelphia Interstate Dairy Council during the months of February and March is carrying on an intensive newspaper advertising campaign which aims to emphasize to the people of Philadelphia the economy of using more whole milk in their daily diet. The campaign is timely for the number of unemployed people in that city is greater than it has been for some years. At the same time the supply of milk coming to the market is more than enough to take care of the present demand for whole milk.

A LANCASTER county tender tells us that several months ago he and some of his neighbors bought stock in a proposed hydro-electric plant to be erected in New Jersey from a salesman then operating in their community. Since buying this stock neither he nor his neighbors have been able to get in touch with the salesman or learn any more about the proposed plant.

We went to the Bureau of Securities in the Pennsylvania Banking Department at Harrisburg and there learned that this salesman was a rascal, that he was run out of New Jersey where he first started to sell this stock, that he had been selling the stock in Pennsylvania without a license to do so, and that he had now again disappeared. We were told that no work on the plant had yet been done and probably never would be.

The experience of these men should drive home the lesson that it is better to investigate before buying securities than afterward. Most of our local bankers have information on hand or can easily get it concerning most securities on the market and as a rule are a safe place to go for guidance.

FROM State College comes the announcement that the annual young farmers' week, held heretofore at the College in June, will this year be held in August and instead of having the club members and vocational students meeting at the same time, the week of August 13 to 16 will be devoted to club activities and the following week to vocational work.

This change of time should increase the attendance at these popular gatherings of young farm folks. June is a busy time on the farm for boys since cultivation of spring crops in then in full swing and haying time about to begin. By dividing the two groups it is also possible to double the number that can be entertained at the College.

Cordie Allen of Susquehanna county goes the honor of having the cow producing the greatest quantity of milk during January among the 29,316 cows enrolled in the eighty cow testing associations active in the state. Her month's production was 2,851 pounds of milk. A registered Holstein owned by J. H. Long of Columbia county topped the list in butterfat production with 102.7 pounds to her monthly credit.

OVER in Indiana county, Pa., 1,600 coal miners' families have entered a contest to see which among them can produce the best garden this spring as well as make the greatest improvement in their home surroundings. They are receiving assistance from the college extension service and fine prizes await the winners. They are bringing the dream of a Pennsylvania Beautiful one step closer to reality.

PENNSYLVANIA BROWN SWISS BREEDERS

WHO ESTABLISHED A COLLEGE HERD. 1929.

Members shown include: J.M. DeLozier, K.S. Bashaw, H.L. Grazier, F.C. Zimmerman, S.J. Houm, R.F. Lohr, A.O. Lape, G.F. Bown, Miss L. Wohlwend, and others.

ON February 25th sixty-five members of the Indiana County Sheep and Wool Growers Association were present for the annual meeting. The election of officers resulted as follows: President, W. R. Thomas, Indiana, Pa., R. 6; vice-president, H. M. Brown, Indiana, Pa., R. 5; sec'y-treas., Clayton Miller, Creekside, Pa.

It was decided to hold another pure-bred ram sale about the latter part of August. W. B. Connell, extension specialist in sheep and wool at State College, addressed the meeting on "modern sheep practices." He also discussed the market situation on wool and the market lamb situation. He stated that enough feed of the right kinds is the first essential for farmers in this state to consider in successful sheep raising.

County Agent Warner spoke on the importance of pasture improvement, advocating the improvement of permanent pastures by liming, fertilizing and seeding. He recommended that soil samples be brought to the county agent's office to be tested for lime requirement.

THE annual meeting of Allegheny County Beekeepers' Association was held in Pittsburgh, February 27th. Report was made of the activities of the Association during the year. Mr. George C. Wilson, Secretary of Allegheny County Agricultural Extension Association, gave an interesting talk on the value of the bees as pollinators of fruit and vegetable bloom.

Mr. E. J. Anderson, extension apiarist of State College, gave an instructive address on bee keeping throughout the state, supplemented by lantern slides. The following officers were elected for the ensuing year: President, J. S. Fleck; first vice-president, A. T. Kell; second vice-president, B. F. Forsythe; secretary-treasurer, O. J. Wohleber.

D. M. Landis, Mrs. A. H. Risser, Clarence A. Reist and Charles F. Preston. These five with one delegate from each farm bureau local in the county and the president of the county society of farm women, who is Mrs. Martin A. Moore, will serve as the board of directors of the organization during the coming year.

One of the activities sponsored by the Lancaster County Farm Bureau is the buying of farmers' supplies through the commodity division of the Bureau. Last year purchases made by farmers through it totaled \$70,000.

During the coming year the organization will push the building of improved "farm to market roads" and will pay considerable attention to present inequalities in taxation.

Gray Silver, formerly representative of the National Farm Bureau Federation at Washington, D. C., addressed the meeting in the afternoon. He gave the history of farm relief legislation of this country, explained the duties and the functioning of the Federal Farm Board and wound up with the conclusion that the Federal Farm Board is not only tackling a difficult task but that its workings are sound and deserve the support of farmers everywhere.

A REFLECTION of ten years of farm progress in Bedford county was the keynote of the tenth annual meeting of that county's Agricultural Extension Association held at Bedford, Feb. 20.

To picture this progress graphically, County Agent Mollenauer prepared a large map of the county on which 14 distinct communities were outlined and the work accomplished in each was enumerated. It was a surprise even to the 200 farmers in attendance themselves to see how far the influence of extension work in their county has gone in a decade.

One of the high spots in this progress was the campaign to stamp out bovine tuberculosis. Bedford county today as a result of the campaign is a modified accredited area.

The dairy cattle of the county have not only been freed of disease, but in type and production much improved. In this improvement two active Jersey and one active Holstein Bull Association have played an important part.

Last year the county had 3 calf clubs with 21 members; 102 potato growers in the county followed out the regular potato spray service and 94 orchardists adopted the fruit spray service.

At noon all those in attendance joined at a luncheon served at the Hotel Pennsylvania. Addresses by the Hon. John M. Reynolds and W. R. Gordon followed.

TWO plant pest quarantines in force in this state last year were removed on March 4th by the Pennsylvania Department of Agriculture. It was found that the Asiatic beetle and the Asiatic garden beetle are no longer of serious consequence.

DUE to illness in our family last week it fell to my lot to wash the dishes on several occasions. We have the regular group of lights in the center of the kitchen but no light in the sink. Therefore it was necessary for me to hold each dish to the light to see whether it was clean with a consequent loss of time. I am now "rooting" for a light in the sink, as my wife has done for some time.

Should I wire a house today as thousands of farmers are now doing I would give particular attention to having the electric lights so placed in the home that all necessary operations in it would not have to be done in shadows. To do this does not necessarily require more lights than are usually provided but it does require more thoughtful care in the placing of them.

Boys May Earn as They Learn Better Ways to Farm

By C. A. MAY

THE farmer is no longer thought of as a "hay-seed" and the work of the farm is not a degrading task but an honorable occupation. "It is an honor to be called a farmer," is a familiar saying. The farming vocation has been elevated, and one of the reasons this is so is because the farmer boy is being taught the latest practices and improvements in the vocation of farming.

Perhaps the greatest service that the agriculture teacher renders is the direction of the supervised practice usually called projects. Since the plan of the project is the boy's plan and not the teacher's or the parent's, the boy has a problem of vital interest. If a boy living on a dairy farm plans to devote his life to dairy work, then he should carry the dairy project and have the advantage of supervised practice in his vocation. At the same time the boy is earning while learning.

According to the Federal Board Bulletin, number 134, boys earned the amount of \$5,376,423.01 for completed project work reported in the United States for the year reported. The average project income of the 49,223 boys amounted to \$109.22 per boy. The per capita cost of instruction based on the agriculture teacher's salary averaged \$74.87 per boy.

A survey made in Missouri shows that, in addition to investment in crops, livestock, machinery, fertilizer and land, 546 boys out of a total 3,081 boys studying agriculture have \$37,718.57 on deposit in checking accounts, 280 boys have \$48,178.65 in saving accounts, and 167 boys have \$145,806.05 in stocks or bonds.

A boy in Massachusetts started with a project of three-quarters of an acre of potatoes, earning \$212.48 his first year. The next year he had a cow as a project and then increased the number to five cows. He borrowed \$2,500 from his father and paid back \$1,100 within one year besides paying all the costs of the project and his living expenses. A Wyoming boy made \$445.25 net profit from two acres of certified potato seed and won 25 first prizes, 11 second prizes, three third prizes and two silver loving cups at fairs.

So vital and practical is the knowledge and experience the boy gains that he never forgets it but applies it in his future work.

Experience with Potatoes

Harry Davis of Preston county, West Virginia, feels that his experience was valuable of which he says, "My potato enterprise in the Vo-Ag club was conducted in cooperation with the Agricultural Experiment Station of West Virginia University to show the value of spraying potatoes. For the land to grow the potatoes I selected one acre of clover sod and plowed it on March 21. One week before planting I harrowed the land three times, disked it once and drilled 950 pounds of superphosphate on the seed bed. At planting time I added 1,000 pounds of a mixture of equal parts of potash fertilizer and sulphate of ammonia.

"I began to spray the potatoes when the plants were about three inches high to control fleas. Arsenate of lead was used for this spray. After seven days I began the regular spray schedule and continued spraying at seven-day intervals through the summer making a total of nine sprays. Five rows in the field were not sprayed, four rows were sprayed with arsenate of lead and Bordeaux mixture.

"The rows sprayed with Bordeaux and arsenate of lead remained green and thrifty about four weeks after the unsprayed rows had completely died down. The rows sprayed with arsenate of lead remained green about

Dana Markley, student in a West Virginia high school, who started with a project of 500 baby chicks and raised most of them to maturity.

one week longer than did the unsprayed rows. The tubers from the rows sprayed with arsenate of lead were only slightly larger. The tubers from the rows completely sprayed were large, uniform and healthy.

"The yields for the various rows were as follows: The rows sprayed with arsenate of lead and Bordeaux mixture produced 396 bushels per acre, the rows sprayed with arsenate alone produced 264 bushels per acre and the unsprayed rows produced 231 bushels per acre.

"My total cost of producing the acre was \$119.50. The total yield for the acre, including the five unsprayed rows and the four rows sprayed with arsenate of lead, was 350 bushels and the cost of production was thirty-four cents per bushel."

It is the diffusion of knowledge of scientific methods that has increased the yields of farms, and the agriculture teacher who has direct contact with farm boys and girls as well as farmers is responsible for the teaching of the most up-to-date methods.

About Asparagus

THERE are many grains and vegetables that mankind has eaten and improved for ages. Some have been changed to such a degree that we do not know the original stock they sprang from, for instance wheat and maize.

Potatoes or tomatoes, although they have been vastly improved, we can yet find growing wild in their original home. But asparagus seems not to have changed much. We find it now in almost the same form it appeared more than 2,000 years ago. The young sprouts, when they first break the ground, have quite a pleasant taste, even when eaten raw. Earthy, you might call it, and since they come early in the spring, it must always have been a very valuable tonic.

The young generation now growing up can hardly imagine the hunger we old folks used to feel after living on salt meat and potatoes through five or six hard winter months.

What an unbalanced ration—with the green vegetables left out—can do to a man my readers will find if they open their Bible at the fourth chapter of Daniel and read the verses from the 29th to the

Agriculture teacher demonstrating to student the proper method of holding chickens in order to determine their approximate weight.

end. If the great King Nebuchadnezzar had only been a subscriber to the Pennsylvania Farmer they would no doubt have sent him a schedule with vitamins and proteins in the right proportions. He must have had an impaired digestion long before his final breakdown occurred or he would never have dreamed such awful stuff as he did night after night.

If he had had only sense enough to tell his cook to have a bunch of asparagus boiled for supper, with a nice cream dressing, he would have slept like a baby.

But my proclivity has carried me away from my topic. I only wanted to show how necessary the vitamins contained in asparagus are to the human body. It has other properties besides vitamins.

I have raised asparagus for over 40 years and believe I could tell my readers a few things they don't know about the cultivation of it, but I would like to tell something of its history and qualities, that I always thought interesting.

I said before that King Nebuchadnezzar ought to have ordered some for his supper, but I am not sure that he would have found it on his bill of fare. The soil of Chaldea is pretty dry and arid. It is a curious fact that in all the early history we have of asparagus it always is found near the seashore. It will grow in salt meadows and, where the ground is porous enough, can even survive an occasional inundation. This gave rise to the belief that it required salt to develop well.

Twenty years ago farmers broadcasted from 500 to 1,000 pounds of salt per acre. When commercial fertilizers came into general use most growers saw that it was not worth while to spend their money on salt when a good fertilizer gave better results.

In Ancient History

As far as I know asparagus is first mentioned in history about the time of Julius Caesar. Plutarch tells us in his "Lives of Great Men" that Julius Caesar had good table manners. He showed it in little things. When he was invited to dinner, a dish of asparagus was put on the table, dressed like many Italian dishes are to this day with olive oil. It happened that this oil had gone slightly rancid—a thing that is not quite uncommon even now in Italy or southern France.

When all the other guests pushed their plates away, Caesar never batted an eye, but ate what was put before him to the last spear. I hope it didn't give him the heartburn, but that unfortunately Plutarch does not mention.

About 400 years later, in the reign of Diocletian, the Roman empire seems to have passed through some trust-busting time. The wholesale provision dealers must have squeezed their customers till they howled. Diocletian—he was a gentleman farmer himself and seems to have taken a pride on broccoli and cabbage—thought he would like to take a hand himself at price fixing. We don't exactly know whether he meant it as a farm relief, for he fixed wages too. A carpenter, for instance, was to be paid 40 cents a day and his board. But asparagus is quoted at 20 cents a bunch, consisting of either 50 wild or 25 cultivated spears.

This edict, discovered more than 100 years ago, is one of the most valuable. (Continued on Page 13.)

DADDY was not afraid of work, but of himself. Give him a job and he would perform it skillfully and in full measure, but he lacked the courage and optimism of youth when it came to striking out for himself, and the idea of risking anything caught him like a stitch in the side. Finally he gave in, less for his own sake than for Nancy's and Toots'. He mustn't, he decided, let his lack of pluck and vision interfere with the young folks' chance.

Toots saw that all the planning would have to come from himself and this rather pleased him than otherwise. He found his wits rising to the demands of a real thinking job. There were a dozen and one things to plan out, all knocking at his brain at once. More roomy quarters had to be provided for the guests, and he and Daddy drew plans for the remodeling of the ell. Daddy was an expert carpenter and Toots was handy with tools, and between them they could furnish the labor. That left the lumber and other building materials; also two sailing skiffs, a raft of "blocks" or wooden decoys, furnishings for the new rooms and a few other necessities. Mere decorative details could wait, though Toots believed they were important. Also there was the vital matter of advertising.

All these things meant money. The more Toots went over them the more he realized how meager was their combined capital, and Daddy, busy with the repairs, would be earning nothing. When this had soaked into Toots' mind he put on his best coat and called on Jepson at the store.

Things were indeed being run in a hand-to-mouth way there. Jepson had got well past the brisk stage of life. He was well-off and had quit active work years before, and resented having to come out of his comfortable retirement. Such a profitable investment as the store could not be allowed to run down, however. Jepson was trying to keep it going, but his knees were stiff and his temper rather short. The negro youth he had hired as an assistant had a positive talent for putting up an order wrong.

Jepson knew all about Toots' experience at the store and welcomed him with an eagerness he tried to conceal. "Yes, you can have a job here," he said. "At the same salary Tigert paid you."

"I wouldn't take it at that," replied Toots. "If I'm to run the store I'll want double that, and an assistant that knows something."

Jepson endeavored to haggle. "That's a lot for a young fellow," he said. "At your age I wasn't earning anything like so much."

"It didn't cost you half so much to live," said Toots. "That's my figure anyway, Mr. Jepson. You can take it or leave it."

THE proprietor took it, secretly delighted at his own escape from drudgery and well pleased that he could leave the store in such trustworthy hands; but he was disturbed when Toots mentioned the assistant he wanted.

"A woman!" he exclaimed. "Why, man alive, that wouldn't do at all. 'Taint the thing. A woman's place's at home."

He yielded, however, before Toots' insistence as he had in the matter of the salary, and Toots departed to consult with Mrs. Nesta Ham. The widow's reception of his proposition removed any doubt he had had of her acceptance. She tossed the dress she had been working on upon a chair and shook a needle-roughened finger at it as she rose.

"There, you're done and I hope you're the last," she exclaimed. "Sewing may be genteel—my sister thinks so—but I call it monotonous, deadening, treadmill work. Thank you for remembering what I said that day. You don't know how glad I am to accept. You couldn't know unless you had spent years shut up at home sewing, sewing, sewing, hardly ever sticking your nose out into the air and seeing almost nobody."

When he left Toots felt that he had done a good thing for Mrs. Ham as well as himself. On his way back to town he met Rose, who was evidently bound for the same house that he, Toots, had just visited. The big man seemed a little embarrassed at first, his conscience not being quite clear for the abrupt way in which he had terminated their contract. He soon recovered his usual air of self-satisfaction when Toots made no reference to the matter.

"What you goin' to do now?" he asked. Toots mentioned the scheme he and Daddy Simons had embarked upon. Somewhat to his surprise Rose unhesitatingly approved of it.

"You know," he said, "I've thought of that myself often." He was quite sincere in believing he had. "And I think you're the man to run it, but you got to organize right. It takes brains to organize, an' money."

"I don't know about the brains," said Toots. "I've

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Stocum Company

got some money and a steady job that will bring in something to turn into the business."

"That's good. Goin' right at it hard, ain't you. But advertising's what gets trade. You've got to advertise in a whole lot of newspapers an' keep it up. It'll eat up money like a horse does oats."

"I reckon it would and it wouldn't reach the trade I want either," said Toots. "I've written to an agency in Philadelphia for a list of sporting magazines. The men who read 'em are the ones who like to fish and shoot and we can reach 'em that way quicker and surer, too, than by advertising in the newspapers."

Rose eyed him with new respect. "Look here," he said abruptly. "What'd you say if I offered to loan you a couple—well, yes, a couple of hundred?"

"Pay it back when you're on your feet."

"Supposing we failed," said Toots. "But I'm gamblin' you won't. Sometimes you're a little queer, but your queerness don't run that way I guess. Besides, I'd be back of it then. I'd blow your horn for you every place I went."

"You're better than your money any day," said Toots, eager to clinch this suggestion. "I'm obliged for the offer, Mr. Rose, but we don't want to start out by borrowing. If you'll speak for us, we'll give you a commission on every one you send. Honestly, I wouldn't like to take your money, and you not here to say how we should spend it."

Rose appeared content with this arrangement. "I'll blow your horn up and down this coast a-plenty," he reiterated as they parted.

Daddy was taking inside measurements of the ell when Toots got back. He had pulled down some of the old beams on the side where they planned to build an extension and Toots sat on the pile while he related the gist of his interviews with Jepson and Rose. It was good news to Daddy that one of

The Cheerful Plowman

BURNING JUNK

THERE was a time when muss and junk, old litter, useless, needless, punk, piled up around my place. I kept this thing and that thing, too, "I need that thing, indeed I do!" I said with smiling face.

I kept old letters by the sea, from mottled cousins and their dad, from scores of weak old aunts, from uncles asking for a lift, from second cousins, fourth and fifth, from neighbors moved to France. I kept old checks and crippled bills, old gray receipts penned out with quills, old recipes and deeds, old funny papers dull and gray, the kind that mummies throw away, the kind nobody needs.

Out in the barn I kept old straps, old buckles, martingales and snaps, old bits of leather tugs, old bottles which in early days held liniments in blues and grays, sure death to bots and bugs. I kept old cans and broken wheels, old splints from ancient binder reels, old gunny-sacks and such, old strips of canvas full of holes, old splinters torn from wagon poles, an aged rabbit hutch.

I never put a thing away without the thought, "There'll come a day when that will serve an end; there'll come a day when I shall need that piece of rag, that splintered reed, some day 'twill be a friend. That recipe will serve me well, as will the hammer from this bell, when need for it appears; some day I'll read this spiel again about that tribe of early men, I'll lay these by, my dears."

But, never did I lay aside a paper, putty-pail, or hide that I sought out again. In fact I always plumb forgot just where, and when, tommy-rot, just where, and why, and when.

One day I had a dandy fire, a blaze that mounted high and higher, a blaze to scare the birds, and there I burned nine tons of trash, old papers, leather, tin and crash, in bevels, flocks and herds.

J. E. T.

them would be earning a salary, and he was also much encouraged by Rose's offer of a loan.

"When a tight-wad like him is willin' to gamble two hundred on us we-all can reckon we've got a right smart project," he grinned.

Toots agreed, looking idly at the names cut in the old beams. Suddenly his eye gleamed and he went down on his knees, blowing the dust from one of the inscriptions.

"Listen to this, Daddy," he exclaimed. His finger followed the words deeply cut in the wood as he read aloud: "Fellow sportsmen all!

This place scores a bullseye. Frank Forester, Dec. 10, 1855." Now what do you know about that?

"One of the gunners my father used to put up, I reckon," said Daddy, his attention focused on his measuring tape. "Eh? What's the matter with you?"

Toots had given a whoop that made the room ring. He rose and seized a fine-toothed saw.

"Here's our trade-mark right here," he said with one of his infrequent laughs. "Don't you know who Frank Forester was? Well, I do. I've got some of his books—Field Sports of the United States, Fish and Fishing—and two or three more. Colonel Jessey called him the Nimrod of America. He said that as long as there was a rod or a gun used in this country Frank Forester's name would be remembered. See the point, Daddy? Here's our advertisement all written out for us and signed, by the greatest sportsman this country ever knew."

Daddy stopped and sat down. "That so?" he queried, trying to see the significance of the thing as Toots saw it. "Well, well, see what it is to be a readin' man, now."

"We'll call this place the Bullseye," said Toots. "It's catchy." That evening after much labor he ground out the following advertisement:

The Bullseye.

The House That Made A Hit with

Frank Forester

America's Greatest Sportsman.

Author of Field Sports of America,

Fish and Fishing, etc., etc.

Fish and Game as Plentiful as Ever

Board and Lodging Better.

"There. We'll trim that up and send it to those magazines, when we get the list," he said. "We'll frame that piece of beam and hang it over the mantelpiece."

Nancy, slim and straight, with eyebrows like strips of black velvet against her clear white skin, smiled over the last line of the ad.

"You put it up to me there, don't you?" she said. "Makes me feel like I was a third partner."

"I always reckoned you as half," retorted Toots. "Daddy and I make up the other."

"Get along with you," laughed Nancy.

"He's kissed the Blarney stone as well as read books," said Daddy. "Ain't I told you, Nancy, that he acts the same as we-all, but he don't talk jest like we-all. He keeps a-pickin' up learnin'."

"He keeps picking up shells, anyway," retorted Nancy teasingly. "He's got a big box of the trifling things in his room. Don't you think he's too old for such playthings, Daddy?"

His days were busy ones now. The list of sporting magazines arrived and The Bullseye ad. was sent off to a picked number of them. Before he went to work at the store Toots ran down to see Mark Crumb and through him met some of the other tongs. A certain number of them would, he knew, resent the Tigert affair and the subsequent drying up of the source of the Red Mill whiskey, but that couldn't be helped. Besides, Carbury was the most convenient trading point for them and they probably would have to come around in time. Toots' object in seeing the tongs was to find out about the fleet's trade, what they would or would not take.

Subsequently he called on Mr. Jepson, with the proposition that they install a coffee urn at the store. He displayed a catalog—his pockets were full of them nowadays—quoting sizes and prices. "It will help to keep the fleet trade," he explained. "They can't get any more hooch of us, but a cup of good coffee—it's got to be good, too—will ease 'em over the bump. They'll appreciate it, coming in after a long sail. Our other customers will, too. People will drop in for it—and then they'll buy. We won't lose anything either if we add a doughnut with each cup, charging enough to cover expenses."

Jepson was old-fashioned and couldn't see at first the logic of mixing business and pleasure, as one might call it; but having already agreed to a woman assistant he felt that it didn't much matter what other new-fangled notions he might allow to creep into the store. He was, moreover, impressed by the intelligent interest Toots took in the business.

(To be continued.)

The Farm Home

In Women's Hands

By GERTRUDE S. STEWART

MRS. G. THOMAS POWELL, of New York Federation of Home Bureaus, represented "the land of the free, and the home of the brave," in the recent World Conference of Rural Women. This meeting was held in London, and delegates from forty-three countries answered the roll call. Leaders among rural women from so many different states were there and discussions prove that women's work, ideals, inspiration and enthusiasm, are the same—the world over.

When the Lord Mayor of London gave his welcome address, these soul-stirring words were his climax—"The destinies of all countries lie in the hands of women."

You will be interested in the general summing up of Mrs. Powell's report on the common interests of rural women. They are: To drive out loneliness by contacts; to make the country woman articulate; to get inspiration; to get a better standard of living; to have conferences and federations.

Another big interest is in the training of country girls, of leaders, of better rural teachers. The educational interests are to make better homemakers through study centers where home-making is properly taught.

The economic interests, too, are the same in forty-three countries. They all seek improved production, better marketing, handicrafts, home interests, better developments of the country's resources, good roads, and to stem the drift from country to town.

What an inspiration it must have been to mingle for four days with delegates from Canada, Australia, Norway, New Zealand, England, Roumania, Ireland, Germany and all the others. The reports of Canada and Denmark are of tremendous import, and they may help our readers in various club activities.

Our neighbor, Canada, sees so much value in the conferences of rural women that the Canadian government pays the traveling expenses of women meeting in conference, the results of the meeting being given to the government. Canada points to the first self-organized rural societies for women.

Country folks learn so much from Denmark. How about this? Every village in that splendid little country reported an institute where culture and interest abound. In these meetings men and women join together—the men being leaders.

Mrs. Powell says the slogan "of the people, by the people, and for the people" was repeated many times in languages to which Abraham Lincoln was a total stranger.

Serve Delicious Souffles

WHY isn't the family treated more often to the delicate and delicious dish which the French appropriately call a "souffle"—literally, "something blown," because it is so light and fluffy? One reason is that at some seasons of the year, eggs are scarce and high, and a souffle depends for its special consistency on three to five stiffly-beaten egg whites. In the spring, however, eggs are plentiful and cheap. Another explanation perhaps is the idea held by many women that souffles are hard to make—In fact, that only experienced chefs should attempt them; that in amateur hands they will fall as soon as they are baked and so lose the very quality for which they are liked.

It's all in the knowing how. Long, slow cooking is one of the secrets of making a perfect souffle. An oven thermometer is a help in maintaining an even low temperature. The very moderate oven heat of 300 degrees F.

expands the air bubbles in the egg whites and sets the light mixture throughout without toughening it. When baked at very moderate heat for an hour or more a souffle which is served immediately will fall but slightly. For a substantial souffle either a thick white sauce or bread crumbs or both will act as binder for the ingredients. A souffle that contains bread crumbs will hold up better than one made with white sauce alone.

Souffles made with cheese, vegetable pulp, ground meat, or flaked fish, are attractive for the main dish of the meal. Sweet souffles are used for dessert. Below is a recipe for one of each kind from the Bureau of Home Economics of the U. S. Department of Agriculture.

Cheese souffle.—Four eggs, one and one-half cups milk, one cup fine dry bread crumbs, one tablespoon butter, one-half pound American cheese, three-fourths teaspoon salt, one-eighth teaspoon paprika, three drops tabasco sauce.

Heat the milk, bread crumbs, and butter in a double boiler. Shave the cheese into thin slices, add it to the hot mixture, and stir until the cheese has melted. Add this mixture to the well-beaten egg-yolks. Season to taste with paprika and tabasco. Fold the hot mixture into the stiffly-beaten egg whites containing the salt, pour into a buttered dish, and bake in a very moderate oven (300 degrees F.) for one hour, or until set in the center. Serve immediately.

Chocolate souffle.—Five eggs, two tablespoons flour, two tablespoons butter, three-fourths cup milk, one and one-half squares unsweetened chocolate, one-half cup fine dry bread crumbs, one-half cup sugar, one teaspoon vanilla, one-fourth teaspoon salt.

Melt the butter, blend the flour with it, add the milk, and cook until thickened, stirring constantly. Melt the chocolate over steam, and add to the

white sauce, together with the bread crumbs and the sugar. Add the hot mixture to the well-beaten egg yolks and beat thoroughly. Add the vanilla. Fold the hot mixture into the stiffly-beaten egg whites containing the salt. Bake in a buttered dish in a very moderate oven (300 degrees F.) for one and one-fourth hours, or until the mixture is well set in the center. Serve hot with hard sauce.

Eat More Butter

IT is the best of all foods. It contains the sunshine vitamin-A so vital to the health, happiness and energy of human beings, the growth of babies and the young—more than any other food. In ancient times butter was used as a beautifier. It is now the means of building your health from within. It creates and sustains radiant health and vitality.

The use of butter makes all foods better. It attracts and satisfies the appetite.

"I love children. They do not prattle of yesterday—their interests are all of today and the tomorrow—I love children." Richard Mansfield.

Try a souffle for a change.

What Is Gain?

By HEPSY NEFF

IF we have among our readers any who are not interested in getting some real gain from every hour of time and material they use they will be disappointed in this article. Successful people are those whose daily program is built around the idea of something to be gained by every penny, every hour and every ounce of energy used.

With spring at hand we are eager to get out of doors but too often we find ourselves weary and spent too early in the day. There is nothing new in finding the body machinery running a bit unevenly after three months of low temperatures and little sunshine. Fortunate the family who went into winter with a good supply of vegetables and fruits, especially apples enough to keep a basket within reach daily.

If this has been done the housemother, worn with work by lamplight as well as daylight, may claim extra hours for outdoor work unhindered by demands for elaborate salads with apples as the basis. Why should she make her good canned fruits into pies when the great need of the time is vitamins? Instead, she may, with a clear conscience, serve plenty of raw cabbage, sauerkraut and onions as well as these same vegetables lightly cooked, remembering the effect of too much heat on the precious vitamins.

With plenty of good milk she may vary her program by cream soups, with or without tomato and minced onion added; or grind her carrots as well as a generous amount of onions and cook together lightly; bake her potatoes in clean skins and offer this alkaline vegetable at its best.

It may be worth while for busy people to be often reminded of these new food elements to help us decide that it is as much a part of wisdom to make sure of a safe supply of vitamins as it is to make sure of a safe supply of lubricating oil in the family car. Cabbage is No. 1, spinach and tomatoes No. 2, carrots, lettuce and dandelion greens No. 3, then whole milk and our fresh young (not half ripe) peas and beans next, with all fresh summer vegetables at our command. If farm folks cannot build health nobody can.

The Old Home Nest

THERE are four apple trees near our house so old that one might well feel justified in removing them. But birds come back to the old nesting-place and our trees attract robins, bluebirds, golden robins and yellow-hammers. So we keep the trees. Each spring they are cleared of small dead branches. One badly split, decayed trunk is covered with vines planted at its base.

And how richly rewarded we are when the birds return each spring! During last winter's gales a hollow limb was carried away. It had been used for several seasons by a pair of yellow-hammers as a nesting-place. Such tapping and examining as went on when the pair arrived last spring. At last a spot was chosen and work begun. Soon an opening was made and another old limb was hollowed out to their satisfaction.

Yellow-hammers are lovers of "antiques." The robins and bluebirds would no doubt find other suitable nesting-places nearby if the old trees were gone but the "hammers" would be bereft indeed. Their busy tappings, close to our window, the gay red on their heads and the flash of gold "lining" when they spread their wings are a big reward for enduring the old trees.

As I write a bluebird sits on a branch so near my window that it seems as if I might almost touch him if the window were open. Now his mate has fluttered out to tell him something and they have both returned to an intriguing hole in an old limb. In fact, we feel that our old trees are paying us a big interest by the diversified bird life which they attract and call back year after year.

Alice M. Ashton.

Cottage cheese, valuable for its high protein and calcium content, makes an excellent filler for sandwiches if moistened with boiled dressing, cream or lemon juice.

Seven Day Tea Towels

20 Cents for Set No. 561

FOR the hope chest, shower, bride or bazaar, as well as for us who have long since qualified as homekeepers, a Tuesday tea towel for Tuesday, and a Sunday one for Sunday, is most encouraging. Outline stitch, two strands of any favorite hue, quickly transforms the stamped material into mighty clever towels, each with a chubby baby, struggling with the task of the day. Pattern No. 561 at 20 cents supplies the set of seven designs in wax transfer form to use on anything from linen crash to sugar sacks.

We can also furnish this set of designs, seven of them stamped on soft, part linen toweling, ready to embroider and use. This is No. 562, and is \$1.40 complete, postpaid. Three skeins of embroidery floss in colors to match the border are ten cents extra.

Address Embroidery Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

The Magic Alarm Clock

"FREDDIE, get up," called Mrs. Williams, her voice rising shrilly to the "up." "I can't get the boy of bed," she wailed desperately, as she hastily carried in her husband's

trousers with cold water," called Mrs. Williams, who was never a very happy frame or mind until her breakfast.

Mrs. Williams looked irresolute for a minute, then proceeded to the kitchen with firm steps. Shortly after, she came from Freddie's room, and the racket in the rear of the apartment announced the fact that Freddie had arisen and was making a scramble to get ready for school time.

Mrs. Williams sang about her work day, fondly believing that Freddie "cured." But the next morning young hopeful seemed to have forgotten his recent unpleasant experience and repeated calls and nudges brought no response.

"House him again," volunteered his mother. But Mrs. Williams did not. A repetition of yesterday's weariness. So she coaxed and threatened Freddie in "the same old way," and he finally tumbled out of bed and into his clothes.

That afternoon there was a parents' meeting at Freddie's school. A lecture on "Habit Formation" and questions. After listening to questions such as, "How can I make Jack more tidy?" and "What can I do to make the best cure for thumb-sucking?" Mrs. Williams raised a timid voice. "How can I make my boy get up in the morning?"

The lecturer asked a few questions and Freddie then calmly said, "I'm not getting up in the morning is Freddie's job, not yours. Put the responsibility where it belongs. I feel quite sure your boy will be able to meet it. You expect him to get himself off to school from now on, without any assistance from you? Try it."

After the meeting Mrs. Williams purchased an alarm clock. She introduced it to Freddie that evening. Next morning she listened to its peal with bated breath. Freddie was right out of bed! Mrs. Williams busied herself in the kitchen and left him entirely to his own de-

vices. Soon he appeared, face shining, hair slicked down, shoes clean. Mrs. Williams served his breakfast. After breakfast, he donned his coat, just like his father and strode manfully into the kitchen to give his mother a "good-bye" kiss.

That morning Mrs. Williams did some hard thinking. "That's the whole trouble," she said to herself. "I've been doing everything for that boy. I haven't given him a chance to shoulder things himself. Why, of course he'd rather mind himself than mind me. I must change." And she did. But she still insists that the alarm clock "did it." She says, "He's as good as gold now and I just couldn't do anything with him before."—Irma Morris, Nat'l Kindergarten Ass'n.

Fresh Carrots in March

I WANT to tell you about our delicious carrots. Last fall we stored them in the cellar and they have kept wonderfully. We merely put them in strong wooden boxes and covered them with sand. Then usually every Monday I gave them a generous sprinkling of clear cold water. Over the top of the box is spread a burlap bag. Pretty nice to have fresh carrots in March, and these are firm and without a wrinkle. That elusive vitamin A has been ever present on our table, for we all like carrots. Would you like some of our favorite recipes?

Carrot-cabbage salad.—Grind equal parts of carrots and cabbage. Salt to taste. Mix lightly with a dressing made of whipped cream slightly sweetened, adding just enough vinegar to make it slightly tart. A blend of half salad dressing and the whipped cream is also nice.

Carrot delight.—Grind enough carrots to make one pint. Add the juice and rind of one lemon. Pour over the mixture one and three-fourths cups sugar, and let stand all night. Next noon or evening, pile the mixture into sherbet glasses, top with whipped cream and enjoy a unique dessert.

Or if your jelly is running low put this same over-night blend on the stove and boil slowly until the carrots are tender and the mass is clear. Pour into your empty jelly glasses and serve with toast as you do any marmalade.

Sue Wyant.

This Guarantee

Guarantee and Ten Year Service Bond

We hereby guarantee this Speed Queen Washer to be free from defective material and workmanship, and we agree to replace without charge any part or parts proving defective. Simply return the parts to the dealer from whom the machine was purchased, or send them prepaid to our factory at Ripon, Wisconsin. No transportation charges, or charges for local repair service will be allowed.

It Is Further Agreed that at any time within ten years from date of purchase, the owner of the machine covered by this bond can return the washer to our factory, freight prepaid, and we will replace all worn working parts, rebuild and refinish the washer so that it will be substantially as good as new at a cost in no case to exceed \$20.00. The Electric Motor or 4-cycle gasoline engine is not included in this agreement as each is fully covered by the guarantee of its manufacturer.

BARLOW & SEELIG MFG. CO.
Ripon, Wisconsin

This Guarantee and Service Bond is Transferable

plus a
\$50
saving

NO washer—regardless of price—is backed by a stronger guarantee than the SPEED QUEEN.

This is because the finest features of quality are included in the SPEED QUEEN.

Whether you are looking for speed... cleanliness... safety... colorful beauty... rugged durability... or for all—you will find them embodied to the highest degree in this popular washer.

Yet, in addition, the SPEED QUEEN has the sole distinction of offering all of these advantages at a saving in price of over \$50.

Mail the coupon below for interesting folder describing the SPEED QUEEN and also giving the name of our dealer in your town.

For homes having electricity, the SPEED QUEEN is available with a high grade electric motor.

Note These Quality Features:

- Large Balloon Wringer Rolls
- Polished Aluminum Tub (Or Choice of Porcelain Tub)
- Submerged Aluminum Agitator
- Removable Splash Ring
- Standard Capacity
- Double Walls to Keep Water Hot
- Self-Oiling Bearings
- Enclosed Mechanism
- 4-Cycle Briggs-Stratton Gasoline Engine

Saves Your Fertilizer Money

Will you be one of the hundreds of farmers who will save 10% to 15% on fertilizer bills this year? You can be—by using Dempwolfs' HIGH TEST (Double 4-8-7) fertilizer—the newest and finest development in fertilizer-making. One ton of the new Dempwolfs does the work of two tons of other fertilizers—does it as well and with freight, carrying and storing charges cut in half, saves you \$4 to \$8 on every ton you buy.

Dempwolfs' HIGH TEST is a proven fertilizer. Repeated and thorough testing shows it to be the finest fertilizer we have ever offered. Specify Dempwolfs' HIGH TEST for this year's planting. Write for detailed folder.

York Chemical Works
York, Pa.

Heals the hurts that slash your profits

THE feeding and care of your cows may be ever so efficient, but don't overlook the vital importance of healthy udder and teats. These final organs in the process of milk-production can quickly rob you of a profit if their delicate tissues develop a stoppage or even the slightest discomfort. It pays well to quickly care for the slightest injury. Serious troubles usually develop fast.

A penetrating application designed for tender tissues

BAG BALM is an ointment of unusual healing properties, especially designed for quick, thorough action on the delicate tissues of the udder and teats. A powerfully-antiseptic oil—a priceless ingredient made by our own exclusive process—is compounded with the refined BAG BALM medicinal ointment. Deep penetration and quick healing bring amazing results in all chaps, cuts, cracked or sore teats—or in treating Caked Bag, Bunches, Inflammation of the udder and other troubles that give discomfort and cause hard milking. Pleasant to use—cannot taint the milk. Inexpensive; large 10-ounce package 60¢ at feed, drug, hardware and general stores. Mailed post-paid if dealer is not supplied. Free Cow Book sent on request.

Avoid Imitations. For BAG BALM results, insist on BAG BALM. Take no chances on substitutes, some of which contain quick-drying and harmful Formalin. For delicate healing use BAG BALM. It is gentle but thorough.

DAIRY ASSOCIATION CO., INC., Lyndonville, Vermont

"No sky above; no earth below. A universe of cloud and snow."

Direct and Indirect Taxes

By R. W. STIFFEY

IN your issue of January 25th appears some very interesting tax data on Mr. Horst's page.

It shows that the per capita tax for local purposes in 1927 was \$36.95, for federal purposes \$28.13, and for state purposes \$11.45; a total of \$76.52 for each person in the state. As the average farm family consists of five persons, that is a family total of \$383.60.

As they would say in the street: "Now what do you know about that?" Do we really pay that much? If so it is surely something to think about. It is beyond reason and almost beyond belief, nevertheless, I believe we do pay it, all of it, incredible as it may seem. Is it any wonder that we often find ourselves mighty short of change?

In this article I am going to say something about indirect taxation, the secret, underhand weasel taxation, the taxation that robs us unawares, that sneaks up from behind and throbs us, that unperceived, surreptitiously kills and destroys.

The Larger Share

In all the articles I have read in farm papers and magazines the matter of indirect taxation has hardly been referred to much less discussed. Why this should be so I don't know, for our indirect taxes make up by far the larger share of our burden. The average man seems blissfully unaware that he is being continually plucked by them in almost every business transaction he makes and that every day, in every way, he is paying taxes for which he gets no receipts. More than that, the average man is hard to interest in indirect taxation and seems peculiarly dense in regard to it. The reason, I take it, is that the average man does not think. How many of us do? If he does think it is only we get out of this tax middle farmers will use their brains, their own brains, all the brains they have, with all the might and strength they have, with little regard for what others say or think.

In the article in issue of January 25th it is said: "It is true that the farmer is seldom required to pay state or federal taxes in Pennsylvania."

That, unhappily, is not true. Nothing could be farther from the truth. It is a mistake, a prevalent but very dangerous fallacy.

This statement, I take it, was a mere inadvertence, for I am sure that both Mr. Horst and the Chamber of Commerce from whom he quotes know very much better than that. What they meant was: It is true that the farmer is seldom required to pay directly state or federal taxes in Pennsylvania. Which is true. But he pays them indirectly all the same.

Gathered from Corporations

The great bulk of our state taxes is gathered from corporations, the public utility group paying the largest share. Where do these corporations get their money? You know, of course you know, and then you know who pays their state taxes for them. When a tax is laid on a corporation

or any business it is charged up with overhead expense. When it comes to make up rates for its service or price for its goods this charge (the tax) expense is included and rates and prices boosted accordingly. The tax is thus handed back to us with a good fat commission added.

We may not pay all these direct but our butcher and baker and candle-stick maker do, and in dealing with them we get charged up with our little share. There can be no doubt about it, the users of their services and the buyers of their goods pay the corporation taxes with a good stiff charge for collection added. In ways the consumer pays a tax production, service or exchange, matter how or upon whom laid. The state gets \$11.45 per capita. We pay is something else again, probably not less than \$15 per capita.

A celebrated U. S. Senator from Pennsylvania, now deceased, regarded also at that time as in political control of state affairs and responsible for state legislation, was interviewed by a friend thus:

"Senator, I thought you were friendly to corporations."

"I am. What makes you doubt it?"

"How then does it come that heavy taxes are being laid on them?"

"Why," said the Senator, "don't you understand that? You should know. Corporations are not taxpayers; they are tax gatherers."

Yes, the farmer does pay state taxes, his full share with costs added. In addition he pays, with other motor taxes and licenses, gasoline taxes, hunting, fishing and dog licenses and still humbly looks for more and he will not look in vain.

State Aid

This brings us to the consideration of that blessed institution "state aid" by which we are helped so greatly and relieved of local taxes.

Where does it come from? Does it drop down like manna from Heaven or well up in a golden stream from the bowels of the earth? By what means has our state become a great Santa Claus endowed with inexhaustible hidden resources from which brings us rich gifts, donating us vast sums for roads and schools? Don't you, mind you, the state donates the money to us.

Gentlemen, if you will put your hands in your empty pockets and think a little you will probably discover where this "state aid" comes from. The late Robert G. Ingersoll aptly remarked: "The state is a pauper. It is continually passing around the hat." You may have noticed that. He was right. The hat is still passing round and farmers are by no means denied the high privilege and honor of helping to fill it.

"State aid" is a great game, very exciting and alluring. We are losing our heads over it. This scramble for state aid in its effect upon manners and morals and human dignity is approaching the level of the game "craps." It's a losing game to farmers. The longer and harder they play it the poorer they get.

The MARKET PLACE

By W. R. WHITACRE

DOWN in Mexico, the land where they elect their presidents and take a "pot shot" at them the next day, they believe in government control of business. A press dispatch from Nogales a short time ago stated that the production tax on green peas in the state of Sonora was increased from 5c a crate to \$2.50 a crate with the purpose of limiting shipments until prices in American markets improved.

This was government control with a vengeance, and what a howl would be raised in the U. S. A. if any such procedure was followed. They must have thought this too stringent, since it was modified in a short time. The latest report states that a \$2.50 tax is to be collected only on inferior peas.

Peas grading five kernels or better to the pod are allowed to cross the border at the old rate of 5c a crate. Shipments passing through Nogales at present are said to be of best quality, as the tax on inferior peas is prohibitive. This measure has been instrumental in checking the demoralization of the green pea market in the United States, according to Consul Maurice W. Altaffer.

Mexico is coming to be a strong competitor of Florida, as sections of that country have a soil and climate well adapted to the production of early vegetables. In addition to this the Mexican labor and land costs are lower. Last year Philadelphia alone received 439 carloads of Mexican vegetables. There were about 200 cars of peas and about the same number of cars of tomatoes. The balance of the 439 cars was made up chiefly of various types of melons and green beans.

This drastic tax law is an excellent illustration of the importance which these competitors of ours attach to proper grading and packing. Such a program would not work in this country where government supervision of private business is opposed, but it should cause growers in Pennsylvania, New Jersey and other nearby states to stop and reconsider the importance of supplying the markets with a first-class product.

Food and Lawns

MARCH or early April is the best time for fertilizing lawns, and chemical fertilizer is necessary if the poor lawn is to be a good lawn, or the good lawn is to be better, asserts Victor H. Ries, extension horticulturist for the Ohio State University.

Lime and barnyard manure often applied to lawns with the intention of making them better, don't have that effect, and usually make them worse, is Mr. Ries' verdict. The lime doesn't help the sod, because lawn grass usually is more tolerant of acid soil than are the weeds. The barnyard manure, while it furnishes plant food, will also add more weed seeds to those already in the sod, and it is better not used. "The best fertilizer for the lawn contains ten per cent nitrogen, six per cent phosphoric acid and four per cent potash," says Mr. Ries. "It should be applied at the rate of two pounds to each 100 square feet, preferably when the grass is dry, or any time early in March."

If fertilizer with the 10-6-4 formula is not available, Mr. Ries recommends the use of 4-12-4 or 6-8-8, with one-half pound of ammonium sulphate added to each 100 pounds of fertilizer.

The Greatest Gift You Can Make Your Farm

RIGHT now is the time when speedy, abundant, sure-footed tractor power can be turned into daily profit on your farm. With plowing to be done and seed beds still to be whipped into shape—with planting, orchard work, harvesting and scores of other big and little jobs still ahead for the coming months—there isn't a bigger gift you can make your farm today than the gift of a Cletrac.

You can buy this Cletrac "20" for Less Money than any other Twenty H. P. Tractor

Here is power for your heaviest implements—smooth, steady-pulling power that rides on broad steel tracks. Here is traction that holds in muddy fields and on steep hillsides. Here is speed that gets work done quickly. Here is unbelievable economy both in first cost and operating cost. Any way you measure it Cletrac offers you the greatest combination of farm advantages ever built into any farm tractor.

Cletracs are built in a complete line and priced as low as \$1095 F. O. B. factory. See the Cletrac dealer in your locality, or write direct for literature.

SAVE those 3 TRIPS

YOU know how it feels to pull in home with a heavy load—with three more trips still to be made. But now suppose the three other loads, just like magic, simply "wished" themselves right there along with the first load, all stored away and no one had turned a hand!

Nitrophoska users haul only one load instead of four—they save those three extra trips—because Nitrophoska (15% Nitrogen, 30% Phosphoric Acid, 15% Potash), contains four times as much plant-food as the old low-analysis fertilizer.

If you used to haul four loads of fertilizer, now you need haul only one. If you used to haul 16 loads, now you need haul only four. Whether you use much or little fertilizer, Nitrophoska saves $\frac{3}{4}$ of the hauling, handling and applying—and, of course, it saves $\frac{3}{4}$ of the freight charges.

Nitrophoska pays! Write for full information and what users say, also name of nearest distributor.

Faulty Judgment

By FRANK K. RICH

"I WOULDN'T want to call it foolishness," maintained Deacon Hyne, discussing the mishaps of Paul Warner, who had attempted to kindle a kitchen fire with what he supposed to be kerosene, but what appeared from subsequent events to have been an active sort of gasoline. "I'd put it down more as a case of poor judgment, if I was called to give it a name."

"There's a lot of things laid to poor judgment that other folks might call different names, 'cordin' to the way they felt 'rds the one that done the job," Caleb commented. "Like Hen Wiggin building his house so his shed and kitchen was on the south side and got all the sun. He called it poor judgment—but his wife called it foolishness and I agreed with her."

"Every day, I s'pose," he went on, "if a man was to watch close he'd find somebody doin' somethin' that c'd be called poor judgment, if he wanted to give it a kind name, and just plain craziness if he tried to find jest the right name for it—and more'n half the time it'd be he himself that'd be the sinner."

"More'n that, Hyne," he submitted, "the very ones that'd be quick to censure somebody else for doin' an ill-advised thing will be the very person to do somethin' as bad—or wuss! Like Nod Bolles, say."

Twins Taken for Airing

"He's quite a carper," admitted the cautious deacon, "and full quick to see a fault in others; I've noticed that."

"He is," confirmed Caleb with emphasis. "He come into my mind since we been talkin' on 'count of somethin' I saw him do one day down at the post office; the time he bought the two live geese of Bill Maddocks's widder."

"It was about the time those twins of Nod's was right between hay and grass, like—too little to walk but big 'nough to git scared and squall like wildcats," he went on, "and one day Mis' Bolles rigged 'em up in clean jumpers and packed 'em into the baby carriage for Nod to give 'em an airin', sort of."

"Well, havin' that job laid onto him and not wantin' to waste time by only wheelin' them 'round, Nod figgered it'd be a good time to go over and see the widder Maddocks about a couple of geese he wanted to buy of her; so off he went about it, wheelin' the two yearlin's in the carriage and both of 'em happy as a couple of coon kittens."

Runaway Geese

"He got to the widder's and after a spell of dickérin'—for she's as close a trader as any man in the township—he managed to strike a bargain with her and then the question come up how he was to git 'em home; and fin'ly the widder roped 'em, leg and leg, and Nod figgered he c'd lead 'em all right by takin' a little time and trouble over it; and up to a certain p'int, he done it. They was c'nside'able wild and untamed, but by herdin' 'em careful he got 'em down as far as the post office and there he made up his mind to rest a mite, his arm bein' tired and the geese seemin'ly as fresh as they was when he started with 'em."

"Right then the question come up how he was goin' to make 'em fast whilst he rested his arms; he couldn't tie 'em to the hitchin'-post for Bill Ames's hoss was there and already actin' nervous at squawkin' they was makin'; so after castin' round a minute Nod backed the baby carriage up against the buildin' and made the geese fast to the back axle—and then he went into the store to do a little tradin' and rest his arm a spell."

"You know, Hyne," Caleb explained, "how it's quite a little down grade from the post office to the brook; and there's that place right above the bridge where folks drive through the brook to water their hosses and tight-

The New OAKLAND EIGHT

PRODUCT OF GENERAL MOTORS

The 2-Door Sedan • Body by Fisher

Let General Motors' lowest-priced Eight bring you superior performance

Have you been thinking that it's about time you, too, were driving an eight-cylinder car? That's what is in the mind of many a farmer these days. And it's not surprising

when you consider how reasonably you can buy such a car as the New Oakland Eight—with its superior performance. The Oakland Eight is General Motors' newest and lowest-priced 8-cylinder automobile. Yet it is really a car with a background of sixteen years' development, for the engineers responsible for it helped design General Motors' first eight 16 years ago. It has an engine which develops 85 horsepower, one horsepower to every 37 pounds of car weight. It is the first stock car of its size and weight to employ an engine of such high power. It has a full down-draft carburetor and manifold system and a two-plane cylinder head which assure efficient fueling under all driving conditions and uniform intensity of power impulses. Superior in performance, the New Oakland Eight is also exceptionally economical. Its parts are unusually accessible and for this reason maintenance expense is low. Its sound basic design assures long service. And its gasoline mileage equals the mileage obtained with many six-cylinder cars of similar size. See your Oakland-Pontiac dealer today and have the pleasure of driving this car. Once at the wheel, you will realize that General Motors' 16 years of experience in the eight-cylinder field have borne fruit in an unusually fine automobile.

\$1045

AND UP
Seven body types. Prices f. o. b. Pontiac, Michigan, plus delivery charges. Oakland Motor Car Co.

Write for an interesting booklet which illustrates and describes the design of the New Oakland Eight.

Remember, you can buy an Oakland on special G. M. A. C. terms. Write to farm buyers exclusively with payments at convenient intervals during the year.

Consider the delivered price as well as the list (f. o. b.) price when comparing automobile values. . . . Oakland-Pontiac delivery prices include only authorized charges for freight and delivery and the charge for any additional accessories or financing desired.

superior performance

A high-power RCA RADIOLA is a necessary part of your farm equipment

Many thousands of farmers have learned by experience that a high-power Radiola is a profit-maker. It has become an essential part of modern farm equipment.

One quick flash of important weather or market news over the radio often saves more money than the cost of several radio sets. Many farmers say that the daily bulletins from the Government and other agencies are of such great value for profitable farming that they could not afford to be without a Radiola.

But every member of the family gets big value out of this wonderful modern invention. There are special programs on the air for mother, entertainment hours for the children, educational hours for young men and women who can't go to college, the finest music by the best musicians and singers, famous orchestras, radio dramas, news of great events, reports of exciting amateur sports—in fact a Radiola in the home is a daily wonder box of entertainment.

Look for and insist upon
the famous RCA trademark

RCA RADIOLA

RADIOLA DIVISION, RCA-VICTOR COMPANY, INC.

Lack of electric service in your home is no handicap to fine radio reception. Two of the best Radiolas made are high-power Screen-Grid sets to be used with battery power. They can be installed anywhere—in the house, on a boat, in a summer camp—and they will bring in the great programs on the air with the amazing realism that has made RCA Radiolas the acknowledged standard of the radio industry.

Radiola 22 is a complete receiver and loud-speaker combination in a single cabinet. Radiola 21 is a table model, with the same receiving instrument as in the "22," for use with a separate loudspeaker.

Ask your Radiola dealer to demonstrate these fine sets for you. You can buy the instrument of your choice on the easy RCA Time Payment Plan. Look for and insist upon the famous RCA trademark.

RCA RADIOLA 22—Cabinet model, Screen-Grid receiver for battery operation. With enclosed RCA Loudspeaker. \$135 (less Radiotrons)

RCA RADIOLA 21—High-powered Screen-Grid receiver for battery operation. \$69.50 (less Radiotrons)
RCA LOUDSPEAKER 101—The leading magnetic type radio reproducer. Designed to harmonize with home furnishings. \$18

TUNE IN—The RCA-Victor Hour, every Thursday night, over a coast-to-coast work of the N. B. C.

What are you doing to *protect* your most important pieces of farm machinery?

Are your feet warm, healthy and comfortable?

It's sure biting cold and damp these early March mornings. Especially tough on *feet*—when you're plugging around before daylight, over frozen clods and paper-thin puddles in stable-yards and hog lots. Your feet are your most important pieces of farm machinery. If they go bad, you can't work, and your whole job is endangered.

You know what a lot of things can happen to feet. So do we. That is why we asked Dr. Lelyveld, one of America's most noted foot specialists, to write, especially for the United States Rubber Company, a little book called "The Care of Farmers' Feet." It is a very useful book. It tells how to avoid and care for chilblains, corns, excessive perspiration, and a dozen other foot-troubles. It's a common-sense book, too. We want you to have a copy. If you will mail the coupon below, we'll send you one without charge.

Your rubber footwear must fit!

Dr. Lelyveld says that during these cold winter months, your feet are best protected by wearing cotton stockings under your woolen stockings. This lessens heat radiation from the feet and also helps to absorb the moisture of perspiration. He says the

best outside protection is given by rubber footwear—but this footwear must *fit*!

"U. S." Blue Ribbon 44-part Boots

Here are just a few of the facts we would like you to know about "U. S." Blue Ribbon Boots.

In the first place, "U. S." Blue Ribbon Boots are made on costly aluminum lasts, which are shaped to give the greatest comfort and ease when walking.

And when you slip on a pair, probably the first thing you will notice is an extremely comfortable and snug feeling around the ankle. And then the ball of your foot will just feel as though the boot were moulded around it. As you take a few steps you'll notice a sort of spring and liveliness caused by that "rocking-chair" curve in the sole and the square, flat heel.

As for construction, maybe you've thought of a boot simply as a single piece of rubber moulded into shape, with a duck lining inserted. But not so with "U. S." Blue Ribbon Boots. Every one of them has 44 distinct parts—fitted together as carefully as a tailor fits the parts of a stylish, comfortable suit.

United States  Rubber Company

A real test for wear

Just to make sure that your "U. S." Blue Ribbon Boots are going to stand up under the rough usage you are likely to give them—in the Blue Ribbon Testing Laboratories a machine presses rubber against swiftly revolving emery, very much like holding a boot against a grinding wheel. The rubber in some footwear chafes away at the rate of 4/5" per hour. The standard for "U. S." Blue Ribbon is 1/5" per hour.

1. "U. S." Blue Ribbon Boots
Put one in your hands some time. You'll find it. You'll quickly realize its superior qualities. Red upper with gray soles, or ebony with white soles. Three lengths: knee, medium, hip.

2. Rubbers for the whole family
We have service about the farm or in town. There's a "U. S." Rubber for every member of the family.

3. Neat-looking Arctics
Durable, for heavy service yet good-looking enough for town wear. Cashmere upper. Red soles or Ebony with white soles. Warm fleece lining. 4- or 5-buckle length.

4. Style for the modern farm wife
Gaytees are the most stylish women's overshoes in the world—Paris style authorities have said so. You'll be proud of them when you wear them into town or over to the neighbor's. And they are made in many different colors and fabrics too, to match your new coat.

5. "U. S." Blue Ribbon Walrus (All-rubber Arctic)
This is one you'll appreciate on the coldest days. If you've never used the "U. S." Blue Ribbon Walrus, try a pair. Slips right over your leather shoes. Kicks off in a jiffy. Built to stand the hardest usage. Red upper. Gray sole. 4 or 5 buckles.

6. For Son and Daughter
Keds are the most popular canvas rubber-soled shoes in America. They give barefoot freedom—encouraging the feet to healthful growth—yet afford the protection you want. They are the chosen shoes of star athletes because they are so comfortable and healthful for the feet. Recommended by physicians and gymnasts.

HERE—The New Oliver Hart-Parr "ROW CROP"

They aren't just wheels,
they're a new way of applying power

Here it is, treading on tiptoe and pulling like a locomotive.

Pulling, pulling, pulling, putting more of its developed power into traction than any tractor ever built before.

It's those wheels--those wheels that don't look like wheels--those wheels that do pull more efficiently, that do end soil packing, that do end side slipping, that do end wheel slippage. They are new in design, new in size--and therein lies the secret of their power.

They aren't just wheels--they're a new way of applying power.

Forget everything that went before.

Nothing like this has ever been seen before.

Watch for it at your Oliver dealer's under the Oliver Flag--the Oliver Hart-Parr ROW CROP Tractor--the tractor that makes many tractors obsolete and will make horses only a memory on many farms.

It's from the shops of Hart-Parr, Founders of the Tractor Industry.

Don't lose out on this--send the coupon for complete information.

on the spokes in a wheel if so be it's dry and the spokes rattle?" The deacon readily remembered the place, having seen it every day for twenty years.

"Well," Caleb proceeded, "Nod had been in the post office for mebbe two minutes and mebbe five--nobody was nothin' the time--when all at once there was a louder squallin' out of the geese and a rattlin' 'bout the same as a baby carriage would make goin' over small stones; and all of us that was in the store made a move to see what was takin' place; even Nod left off platin' out faults in the way 'Lisha Barrows was raisin' his children, to step along to the door to see if anything 'd be wrong with his own youngsters."

"And there was, Hyne," Caleb asserted. "There was a plenty wrong with 'em! Them two geese--and they weighed twenty pounds apiece and was nigh as strong as a couple of calves--had managed to pull the same way at the same time and they'd started that baby carriage down the grade to'rds the brook and they was ahead of it, wingin' and footin' it their best gait--headin' for water: when they was in trouble, you know."

One Good Effect

"There wa'n't nothin' to do," Caleb said, making plain the helplessness of the assembly. "They'd got a good start and no overtakin' 'em--and who ever heard of it doin' any good to holler at a goose? All we c'd do was to put after 'em; and we done it, Nod will in the lead!"

"They struck the brook where it was a little shelvin' so the carriage run out level and didn't tip over, and they kep' on 'til the water come up to their necks--and that minute they got up a squall that drowned out the geese--and they'd been doin' their best."

"Well," he went on, "we waded out and rescued 'em--geese, twins and all; and there wa'n't no real harm done, more'n that the twins was bringin' wet and scared jest about well--and that Nod got a jawin' from Mis' Bolles that I'll bet he carries every word of in his mind to this day!"

"But it had one good effect," Caleb concluded. "If Nod ever gits started 'bout his flaws in other folks' judgment all you've got to do is say: 'A man that wouldn't scarcely know how to hitch a couple of geese to somethin' solid!' and he'll shut right up that minute."

"I sh'd say he might!" the deacon asserted.

Champion Rodent Catcher

It is believed that Mr. Frank Auchincloss of Richland, Lebanon county, Pa., is the champion rodent catcher for the year 1929. Professional rat catchers may have done better than Mr. Auchincloss, but his record of 310 mice and 235 rats trapped in the year just ended appears to make him a champion.

Mr. Auchincloss has passed his score and ten some years ago, but is still "young" and a capable farmer. Besides assisting in the regular farm work, he, with only a single partner, has husked this fall 50 bushels of corn. It is this mighty pile of corn which draws the rats and mice from the near neighborhood. Mr. Auchincloss is determined that they shall spoil as little as possible of it, and he has his excellent record.

Robert I. Weigley.

Scores Women Drivers

THINK women automobile drivers are quite a nuisance on the highways of today. They would just as soon run over you as pass you by, when they have a punctured tire or other trouble you will see many a man sitting along the road waiting for a man to come along to help. Women drivers are always noted for being just as smart as a cat, but when a cop comes along they just smile at him so pretty that he can't help but pass them by. S. W.

Ask Your Fertilizer Man About

4-8-7

It Makes Potatoes Pay!

In choosing your potato fertilizer this season it will pay you to examine the methods used by some of Pennsylvania's most successful growers. In spite of an extremely dry season the Pennsylvania 400-bushel Potato Club has had another big year with many members above that high mark. Describing the fertilizer practices of the club, Prof. J. B. R. Dickey, of Pennsylvania State College, says:

"All the club members this year used a complete fertilizer. Only four used less than 3% of ammonia and only a very few, over 4%. The potash percentage ranged from 4% to 10%, but usually ran around 7% or 8%. During dry seasons experiments prove that rather high percentages of potash keep the vines green longer and

give extra increases in yield. A great majority used about a 4-8-7 mixture in the past year. Experiments indicate that this is probably best suited to average needs."

Your fertilizer man can supply you with 4-8-7. If he cannot, ask him about 4-8-6 or 4-8-8. Well-fed potato plants stay green and vigorous under adverse weather conditions and produce big yields. The potash in these fertilizers keeps plants working hard, transferring starch and storing it into tubers to make big chunky No. 1's. Feed your crop carefully and abundantly. IT PAYS!

Roller-Harrow

A wonderfully useful implement in preparing the seed bed. The harrow levels the ground, brings the clods to the surface while the roller crushes the clods and packs the soil. One man with single team performs two operations.

Ask about Farquhar Grain Drills, Harrows, Two-Row Corn Planters, Shovel Plows, Potato Cultivators.

A. B. FARQUHAR CO., Limited
Box 746, YORK, PA.

HOFFMAN'S SWEET CLOVER

For a heavy crop of hay--pasture and green manure, soil improvement, sow Hoffman's Sweet Clover. Rich in protein. Thrives where other clover and alfalfa will not grow. Hulled and scarified--it starts quick. Clean--90% per cent. Free from foul weeds. Pure. Three varieties--White Blossom, Yellow Blossom, also Grundy County Dwarf strain.

Write today for free samples and big new catalog of field seeds.
A. H. HOFFMAN, Inc.
Box 413, Landisville, Lancaster Co., Pa.

Earliest Tomato

Nothing earlier to be had anywhere. Regular price 15¢ per pkt. but to introduce June's Quality seeds will send a pkt. of this Tomato and Cucumber, Carrot, Lettuce, Onion, Radish, Pumpkin, Asparagus, Giant Zucchini and Ruffled Giant Sweet Peas if you will enclose 10¢ each to pay postage and handling. A coupon entitling you to 10¢ worth of seeds and plants free with each collection. Our handsome FREE colored catalog is full of bargains to seeds, plants and samples and is sent free. Many now send free. J.W. JUNG SEED CO., Farm 16, MADISON, WIS.

"On the bag—and in it"

LIKE the seal on a bond or the signature on a check, V-C's name on a fertilizer bag means "Good." V-C fertilizers pay face value in full.

Demand high face value, high analysis—and in a V-C bag you get rich, concentrated plant foods, the very best that economy and experience advise. In all V-C fertilizers, whether low analysis or high, honest values are blended most carefully and every value is there.

A name—Virginia-Carolina Chemical Corporation. But what a good old name! No wonder you welcome it on a V-C bag, for you know that name is inside too.

Virginia-Carolina Chemical Corp.,

RICHMOND, VIRGINIA

Factories and branch offices at convenient points

Peaches Rot on Trees

I have a peach orchard near the top of a hill. Last year I had a good crop of peaches, but about the time they began to ripen they rotted on the trees by the bushel.

This ground is in grass and cut as meadow. It faces northeast. Part of this ground is inclined to be wet and soggy.

YOUR peaches are attacked by a fungous disease, the brown rot. Spraying or dusting is the only satisfactory preventive. Spraying should be with self-boiled lime-sulphur or dry-mix lime sulphur; dusting with very finely divided dusting sulphur, perhaps mixed with some dry lime-sulphur. From two to five applications will be necessary, according to the season and variety, beginning when the fruit is about half grown.

In addition to spraying or dusting, the fruits should be thinned so that they will not touch each other when ripe, as the disease spreads in this way. "Mummied" fruits, the dried, wrinkled, diseased fruits of last season, are the source of infection this season. They should be gathered before spring and buried or burned, or shaken off and plowed under.

Do you really expect to have a profitable peach orchard when "the grass is cut as a meadow"? If so, it will be quite unusual. Most successful commercial peach orchards are cultivated annually and late summer cover crops, as millet or buckwheat, are plowed under.

Peaches Ripen Late

Kindly let me know through the columns of the Pennsylvania Farmer what to do with my peach orchard of seven hundred trees. They are coming five years old this spring. They had two crops of peaches.

Trees are kept in fine shape, nice and thrifty. Peaches always ripen two weeks later than my neighbors' ripen and I have the same variety, J. H. Hale, Elberta and Salway. I spray the trees and fertilize with nitrate of soda in May. Would peaches mature earlier if I would feed the nitrate earlier? What time would you suggest?

THE time of applying nitrate of soda, provided it is applied in early spring, would not materially affect the date of ripening, but evidently you are using it too late. It should go on two weeks before the buds burst; this is more likely to be in April than in May. If no nitrate were used, the fruit would ripen earlier, perhaps a week or more earlier.

If you could get enough new wood each year, by thorough cultivation and severe pruning, so that it would not be necessary to use a nitrogenous fertilizer, this might give you the desired result; but you would run the risk of losing in size of crop more than you would gain in earliness of ripening.

I suggest that you cut down your nitrate to the smallest amount that will give enough new wood for next year's crop, when coupled with good cultivation and heavy pruning, and apply it earlier. If you want to plant a yellow peach that will ripen before Elberta try South Haven. S. W. F.

Quinces Fail to Bear

My quince bushes bloom heavily in the spring but about a week later all except a few fall off. They do not freeze. They are about 15 years old and are planted in rich black soil.

A severe pruning would be the worst possible treatment; it would favor a succulent growth of sprouts which would be very susceptible to that most destructive disease of the quince, the fire blight. Prune the bushes lightly, if at all. Sometimes the blossoms are killed by fire blight, and occasionally by a fungous disease, but the probability is that this is a pollination or nutrition problem.

S. W. F.

If You Know This Orchard, Show Them This Ad.

Some disk harrows can't work in certain soils of Pennsylvania—rocks and stones and lime gravel soil wear them out too soon.

We've been told about a certain 40-acre orchard in York County that has given up disk harrows because they can't stand the grit. A single son's work and they're a complete wreck.

This orchard should use Clark "Cutaway" harrows.

For Clark "Cutaway" disks are tough. They're made of cutlery steel, heat treated and tempered.

Purged edge disks found only on Clark "Cutaway" harrows and plows stay longer. They won't crack or break even on stony soil.

They're unconditionally guaranteed for 3 years. Any disk that cracks or breaks or becomes unserviceable from any cause during that time will be replaced FREE. And you are the judge.

Clip coupon for FREE catalog which shows the complete line of Clark "Cutaway" harrows and plows and shows the type of disk harrow that has given from 10 to 40 years of service. "The Soil and Its Tillage." Also see Clark's "Cutaway" harrows and plows.

Single Action Harrow with cutlery steel disks, heat treated and tempered. Unconditionally guaranteed for 3 years. Disk carry weight of machine. Disk extension for mowing and grading. Clark's "Cutaway" harrows and plows. "The Soil and Its Tillage."

The Cutaway Harrow Company, 100 Main Street, Hingham, Conn.

THE YOUNG PEOPLE

"Make the Best Better"

By HARMONY HUTCHINSON

ONE of the Pennsylvania Four-H girls' projects is the "My Own Room" Improvement Club. Girls in these clubs learn to utilize materials at hand and turn them into attractive furnishings for rooms.

An educational exhibit at the State Farm Products Show at Harrisburg in January showed what is possible at little cost. An adequate and convenient bedroom was fitted up in a 9-by-12-foot space.

A closet was improvised from boards and fitted up with a pole. The top of the closet formed the shelf for keeping the hat box. The box, a soft green, was made decorative by pasting a colored picture over the label. A muslin curtain on a rod could be drawn to make the closet dustproof. A scalloped figured valance at the top made the closet attractive as well as useful. A shoe and stocking bag of a soft green gingham bound in tan hung on one side while a laundry bag of the same material was on the other side. Six hangers and shoe trees which had been enameled tan completed the closet fittings.

At the center of the back wall of the room was placed a dressing table made from orange crates and a board, lined with the same print as the closet valance, with muslin curtains to draw over the shelves and a scalloped printed scarf for the top. On either side of the mirror were pictures, prints of famous paintings, framed with adhesive tape and shellacked. At the other corner of the room was one of the two windows. The ruffled curtains were made of inexpensive unbleached material dyed the same green. An iron army cot was made into a day bed for the sum of sixty-four cents by bleaching feed bags and making covers for the ends and cot. The same bags were dyed green, hemstitched and embroidered in orange and lavender wool for cushions on the cot. A small table with a lamp made from an old jug electrified and a pleated dull orange paper shade stood at the head of the bed against one wall.

Old Pieces Refinished

Against another wall was the study and relaxation corner. An old table had been refinished. A desk set consisting of blotting pad and book ends

was covered with an attractive green paper, and a utility box was covered with a figured paper in violet, green, orange and black. At the left of the desk was the other window, insuring correct light as well as cross ventilation. Beneath the desk were simple home-made book shelves. A bridge lamp with a plain shade was handy to the desk and rocker for either study or sewing purposes.

The chairs and tables were old pieces refinished. The color scheme of very soft green, violet and touches of yellow orange made a lovely combination.

Any girl can improve her room by following a few simple rules.

1. Provide convenient arrangement by making furniture conform to structure of the room and by grouping according to use.

2. Plan harmonious color scheme by having large areas (wall and floor) dull plain colors or indistinct figures and by bringing in bright colors in small quantities (pictures, candles, etc.)

3. Make care and cleaning easy by using simple furniture, smooth walls, hard surfaced floors and washable woodwork.

All this is a part of the Four-H Club Girls' Room Improvement Club. Details of this project can be obtained from the home economics extension representative in your county. She has her headquarters in the same office with the county agricultural agent, both workers being in the Extension Service of the Pennsylvania State College.

An Evening of Fun

By BARBARA E. SHOEMAKER

AT last the evening for the party arrived. The house was lighted with tall green candles and shamrocks decorated the wall. Every boy wore a bright green tie and the girls had ribbons.

Have you guessed it was a St. Patrick's Day party?

There was a contest. Each one was given a slip of paper, a toothpick and a stick of chewing gum. After chewing awhile, the object was to shape a pig with the toothpick. The reward was a little, wiggly wire snake, that made the girls scream.

A pen and ink sketch of a pig hung on the wall. We took turns pinning on the tail. The game grew quite exciting.

Every one acted as Irish as possible, which made lots of fun.

Oh, yes! and each one had to cross the Irish Channel. A chalk line was drawn on the floor, which we tried to walk looking through the large end of a pair of field glasses.

Then the lunch was served. We had nut salad covered with whipped cream, on a lettuce leaf, green cakes shaped like a shamrock, tomatoade in tall, thin glasses, and a dish of pistachio ice cream.

When we had finished eating we sang Irish songs and told the funniest Irish jokes we could think of.

All too soon it was time to leave. Being presented with small Irish hats, we lined up, bidding farewell to our hostess and thanking her for the lovely evening. Then we marched home to dream of the green Isle of Erin.

PRIZE WINNERS

These boys and girls have received prizes for submitting the best story about the naughty kittens: Jean Bigard, Geraldine Thomas, Beatrice Croft, Delma Gump, Raymond Kiefer, Alleen Barton, Dorothy Williams, Leslie Reynolds, Dorothy Murray, Dorothy McCusker, Cecelia Coskey and Fay Joyce Flint.

A Corner of the Girl's Room

ANOTHER LIMERICK

Submitted by Christine Winnies, Penna.
He lives with his friends in the sea;
The children who spy him all flee.
Though he is quite small

He can sting the tall

Add the last line to the limerick and receive a book prize. Send your answer immediately to Puzzle Editor, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

SIGNS OF SPRING

I have a little pussy,
Her coat is silver gray.
She lives in the great meadow
And she never runs away.

She will always be a pussy,
And she never will be a cat.
Because she is a pussy willow,
Now what do you think of that?
New Jersey. Dorothy Grabanla.

The Bible tells us how hard it is for a rich man to get to Heaven, but it does not say that it is a cinch for a poor man either.

A GAME OF "I SPY"

Hyacinth, daffodil, crocus, so spy,
Down in the ground are all playing "I spy."
"Safe! You can't find us," they cry, "Mr. Sun!
You must be it for a long time! What fun!"
Patters the rain on each young, tender thing.
Then comes the sun, and he shouts: "It is spring!"
Dotted the grass like dear fairy lamps lit—
"Crocus, I spy you, and so you are it!"
Mattie Lee Haugen.

Mother: "Oh, dear me, I am so worried,
Jean went out without her hat and it's raining."
Father: "Don't worry, she just had her hair shingled."

A friend who is not in need is a friend indeed.

Most soft jobs come as the result of hardwork.

To get the best in an argument, keep out of it.

Little Folks' Corner

Baby Squirrel

I MUST tell you about my pet squirrel. He has nice fine, red hair, and nice gray eyes. I got my pet one day during a storm when a tree blew down. He was just a wee thing then and is only six months old now. He eats nuts and corn. He is very shy and will play only on warm days.
Pennsylvania. Mary Baker.

Helen's Lamb

I will tell you of my pet lamb. I call him Dick. When he was little I had to feed him on a bottle and made a pet of him. He would follow me everywhere I went and could go as fast as I could run. He will follow nobody but me and if he sees me coming he will jump like a rabbit all the way to meet me. If I go in the house and don't let him in he goes "ba-ba" until I have to let him in. He is great big now but is still a great pet.
Maryland. Helen Bose.

More Lambs

I am going to tell you about my pet lambs. I had three of them. Their names were Snowball, Jimmy and Powder Puff. Powder Puff was the mother of Jimmy and Jimmy was my favorite pet. He followed me everywhere I went and would eat from my hands. One day I was running and Jimmy after me. I stopped suddenly and he bumped into me and I fell over. Then he stood and looked at me as if to say, "I didn't mean to do it."

This fall he was in the barnyard with the other lambs. One night some dogs came and killed him. Then with-

in a couple of weeks the dogs killed the other two pets.

Rose Goldscheiter.

Pennsylvania.

Jumping Rabbit

I have a cute little rabbit called "Snowball." Every evening we have fun with it. We put all the chairs in a ring. Then Snowball is put in the middle while we watch him do his tricks. He will jump over a spoon and back again; goes spinning around the ring and tries to stand on his head.
Pennsylvania. Florence Eifert.

Frog in a Bowl

Last summer I had a pet woodchuck that would lie in my arms and drink milk out of a bottle. Then last winter I had a little frog in a fish bowl. I fed it flies. As I put them in the bowl it would jump off the moss and grab the flies so quickly I could hardly see them disappear. On cloudy days it would stay under the moss in the bowl and on sunny days it would sit out on the moss. Emma G. Craig.
Pennsylvania.

TELL US ABOUT THEM

What is the strangest pet you ever had or heard about? Next week there will be ten pencil boxes given as prizes to the readers who send in the best story on "My Quirkiest Pet." Send pictures if possible. Write plainly, using one side of the paper. Give your age, as well as your name and address. Only one week for this, so mail your letter immediately to Little Folks' Corner, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

Upper left.—What a big pony and cart! Photo shows the elephant taxi, Rosie, pet jumbo which pulls the youngsters for a ride through the streets of Miami.

Upper right.—Fort Myers, Florida. Thomas Edison, world's foremost inventor and electrical genius, with his distinguished guests who attended the unveiling of a memorial tablet to Mr. Edison at Evans Park here on his 83rd birthday. Left to right, Harvey S. Firestone, rubber magnate; Mrs. Edison, wife of the inventor; Thomas Edison, and Henry Ford, Edison's close friend.

Center.—Burbank, Calif. Photo shows the old new "flying wing" designed by John K. Northrop (of record-breaking Lockheed plane

fame), said to be the first plane consisting only of a wing and tail assembly without use of fuselage to have passed the tests successfully.

Photo above shows the plane as a pusher, but the prop may also be attached in front as a tractor. Specifications of the experimental ship are: wing spread, 30 feet; height from ground, five feet; length, 20 feet; motor, 70 h.p., inverted in-line; maximum wing thickness, three feet. Test pilot Eddie Belande is shown in the cockpit.

Lower left.—First photo of the plans for the memorial to George Rogers Clark, noted western pioneer and explorer, which have just been approved by the Fine Arts Commission at Washington. The memorial is to be erected at Vincennes, Ind.

Lower right.—The striking monument, combining the ancient art of Egypt with modern art, which will be erected by the Compagnie Universelle du Canal Maritime de Suez, to commemorate the fifteenth anniversary of the opening of the Suez Canal this year. The monument, designed by the architect Roux-Spitz and the sculptor Raymond Delamarre, marks the spot where the Orient and the Occident meet.

A typical cow of this experiment

The Calving Story of 32 cows

A cow that has trouble calving goes off in her production for months. Calves that come dead mean a distinct loss, especially if it's a heifer and you wanted to save her. Calves dropped puny and undersized usually never grow out. These well-known facts are responsible for the following observations from the Dr. Hess & Clark Research Farm, of Ashland, Ohio.

Thirty-two cows were bred, fed and cared for alike. But in addition to the regular feed and care, 16 were given Dr. Hess Improved Stock Tonic for at least 60 days before they calved and during lactation. The other 16 cows did not receive the Stock Tonic.

The 32 cows all calved . . . but not alike! Of the 16 that did not receive the Stock Tonic, 7 had calving trouble. Two of them calved prematurely, dropping subnormal calves, one of which was born dead. One dropped a subnormal calf which died soon after it came. Two of the 7 developed serious udder trouble. Four retained their after-birth. One of the other 9 developed milk fever.

Every last cow of the 16 that got Stock Tonic calved normally. Every cow dropped a fully

developed calf. Every cow came to her milk normally except one that developed milk fever.

Fifteen out of 16 cows fed Dr. Hess Stock Tonic milked in top shape. No calving troubles to hamper their production. Half of the other 16 (the ones that didn't get Stock Tonic) were handicapped by calving troubles . . . a handicap that cut their milk production to sixty per cent of normal . . . and that for the entire time they were in milk.

Accurate records on every cow at the Dr. Hess & Clark Research Farm for the last three years show that those which received Stock Tonic produced over \$60 more profit per cow per year than those that did not. The Stock Tonic cows calved normally. Forty-three per cent of the cows which did not get Stock Tonic calved prematurely, or irregularly.

Dr. Hess Improved Stock Tonic costs 2c per cow per day. Follow our plan of continuous feeding for biggest returns. Now is the time to get a 90-day supply from your local Dr. Hess dealer. Figure 18 pounds per cow. Dr. Hess & Clark, Inc., Ashland, Ohio.

Dr. Hess Improved Stock Tonic

A Conditioner and Mineral Supplement

CATTLE

MILKING SHORTHORN CATTLE
HAMPSHIRE SHEEP HOOS
BIG TYPE POLAND-CHINA HOOS
Two bull calves, six months old, three younger, can furnish yearling heifers. All from high-producing cows. Five yearling rams, four and one ewe, all from high-producing ewes. All of the right type and right kind. If interested, write your name. All shipments guaranteed.
E. H. Williams, Marlinton, W. Va.

MILKING SHORTHORNS—One roan bull calf, 1 week old. Other calves also.
C. G. WAGNER, Westford, Pa.

MILKING SHORTHORN BULL AND HEIFER
Calves for sale, 2 to 7 months old, from good producing dams. Accredited herd.
LEE, R. SCOTT & SONS, Burgettstown, Pa.

D. S. POLLED HEREFORDS—A fine selection. Cows, heifers, bulls. Come or write.
CHAS. D. OIL, Millersport, Ohio.

BUCK & DOE RUN VALLEY FARMS
Hereford cattle, Poland-China hogs, Hampshire Pigs, Draft Horses.
THE SAINT AMOURE COMPANY, Marionville, Penna.

ACCREDITED MILKING SHORTHORN BULLS, in one year. Females all ages. Red and Rouen. C. M. KENNEDY, Ulster, Bradford Co., Pa.

Angus Cattle at reasonable prices.
Write BAYARD BROS., Wayneburg, Pa.

HORSES

HYLLMEDE FARM BELGIANS
Sired, sleek, old, Grand Champion Stallion, Sorrel, rising two-year-old, Junior Champion Stallion. The large rugged kind with quality. Bred nates, two, three and four years old. If in need of a stallion or mare, come and see these.
Hyllmede Farm, Fred H. Cook, Mgr., Beaver, Pa.

PERCHERON & BELGIAN STALLIONS
Work and show nates. If a good stallion is needed in your community, describe your wants.
W. O. ZIEGLER, Delaware, Ohio.

Registered Percheron Stallion, Indeb. 1389 lbs. 6 yrs. old, good breeder and worker, price low. S. D. GREINER, Poland, O.

SWINE

O. I. C. HOGS on time
Write for Hog Book.
Originators and most extensive breeders.
L. B. SILVER & CO., Box 506, Salem, Ohio.

POLAND CHINAS
of approved breeding. Bred Sows, Service Boars, Private Sale Catalog to prospective buyers.
C. S. EPFLEY, Zanesville, Ohio.

BIO TYPE POLAND-CHINAS. Fall pigs either sex, bred gilts, big, easy feeders. Price right.
O. C. FOWELL, Ada, Ohio.

REGISTERED JERSEY HEIFERS, bred and raised. Also bulls, best of breeding.
D. J. KENEF, McVeytown, Pa.

Farm & Dairy

By L. W. LIGHTY

OATS is grown in every section of our state and next to corn is the largest and best feed crop we grow. It is true in the altitudes of the southern counties oats is not very productive in seasons, but being a convenient and an easy step in the rotation crops it is generally grown, and the extremely low price of wheat will be more largely grown.

When wheat prices afforded considerable corn stubble was readily sown to wheat in the autumn and that reduced the oats acreage. Usually the yield of wheat on the stubble is light. We can grow four or five times as many bushels of oats to the acre, which under present conditions is worth more than the wheat.

Another consideration is distribution of labor. Sowing the corn stubble to wheat crowds an already busy season and also enlarges the harvesting area when haymaking pushing us.

There is only one excuse for not growing the corn stubble to wheat and is to practice the three-year rotation which hardly one in fifty do. A farmer sows soy beans instead of oats but we need more experience but we recommend this plan generally. The logical as well as the practical steps in the rotation of the great majority is corn, oats, wheat and clover to sod.

Some Requisites

The old-time notion was that will grow and yield regardless, but are rapidly learning better. Quality few have given attention to the seed and by careful selection and seed only perfectly clean, plump and seed have increased the crop 50 to 100 per cent in the last several years. Of course it was not seed alone; the better preparation and the seedbed contributed considerably to the increase in yield.

Fertilization has been a great factor. Not long back the majority farmers considered the fertilizer piled to oats as practically lost, the progressive ones soon demonstrated that a liberal application would fully increase the quantity of seed and the size of the heads. When the threshed the kernels were plump and heavy instead of light and chaffy was the case with that which no fertilizer. A bushel of 32-pounds oats is worth lots more than one of 24 or 26 pounds.

Thus of late years has the crop been greatly improved and the farmer greatly benefited. The crop is now more profitable, still there is plenty of room for improvement.

Oats a Major Crop

In northern sections and the altitudes of Pennsylvania wheat is grown in a small way. The crop tation is corn or potatoes, oats and grass for sod. The climatic condition is very favorable to oats. Large crops of fine grain are especially by those who have the needs of the crop and supply them.

Those who grow potatoes heavily and the residue of plant with a light application makes favorable conditions for the oats. Those who grow corn have less of fertilizer to the oats pays in oats crop, and pays doubly in the lowing crop of hay and the sod.

Frequently the limiting factor in production is the quantity of seed. Often we do not sow enough seed and true that some varieties stand out than others, but it is a quick growth at best, as it is a quick growth. On good soil fertilized, ten pecks of seed has been found best if seed is clean and viable. On the

This is Tiddleywink Quality Girl, the national champion senior four-year-old Jersey in the 305-day class. She made 1,000.62 lbs. butterfat 17,278 lbs. milk, in 365 days, while her 305-day record is 828.44 lbs. fat and 12,845 lbs. milk, making her the winner of two medals of merit. She is owned by Mrs. Florence Gale Neal of Oregon.

and eight pecks has yielded almost as much.

Registered Slackers

Doubtless it is quite legitimate and legal to rub it in on those who keep unprofitable scrub cows, but when one of them buys a registered cow and puts her in the stable with his scrubs and she gives less milk than a few of his scrubs he surely has a case against us. In such a comeback one of them has lately hit me pretty hard. His experience in a community where registered animals are uncommon was really unfortunate, because he got one of the registered slackers.

I did the best I could under the circumstances and showed where I had on a number of occasions urged breeders and sellers to discard such unprofitable cows, also where this work has been adopted by some associations for registry and that hundreds of cows have been put out of the registered class because they failed to yield profitably.

My friend conceded my argument, but assured me that did not make his high-priced registered cow give a profitable quantity of milk, and he was right. I might say it is not the first time I was raked over the coals about this unfortunate condition.

The time is here when every registry association for dairy animals should not only guarantee its pure blood lines but also give assurance to the buyer that the registered animal under proper management possesses the ability for profitable production. I realize it is a difficult problem, but it is being solved in some quarters and must be solved finally by every association.

I have in mind the common everyday farmer who needs help more than any other. To him an animal with the registry papers means something, but to my irate friend of sorrowful experience it means, unfortunately, less and a black eye for registered animals and possibly those who recommended them.

New Law on Retailing Milk

ACT 428, which was passed by the last Legislature, and which takes effect September 1, 1930, requires that all persons selling milk or other fluid derivatives of milk for human consumption shall secure a permit from the Secretary of the Pennsylvania Bureau of Health, Harrisburg, Pennsylvania, or from the municipality in which the milk is sold, provided the municipality has a milk ordinance which calls for the sanitary inspection of the dairy farms furnishing milk to the municipality, and provided that the ordinance relating to dairy farms inspection is enforced by the municipality.

Application blanks for permits to sell milk may be secured from the Secretary of the Pennsylvania Bureau of Health at Harrisburg. There is no charge for the permit but the applicant must furnish information as to the name and address of the applicant, designation of milk to be offered for sale, the name of the municipality or municipalities in which the applicant de-

DAIRYMEN: USE THIS NEW RAPID-FLO FILTER DISK

QUIT WORK ON TIME SHIP CLEAN MILK DAILY

The time needed to filter milk thoroughly has been practically cut in half with the perfection of the new Johnson & Johnson Rapid-Flo Filter Disk, which established an average period of 5 minutes to filter a 40-quart can of milk during extensive tests under actual farm conditions (particulars on request).

FINISH YOUR WORK ON TIME

Your men need no longer waste their time waiting for the milk to filter. Rapid-Flo permits a steady stream of milk to pass through the strainer—with a speed never before attained! Your men will not be tempted to jam the strainer down on the can to hasten filtration. Jamming the strainer damages the disk, defeating the purpose of filtration.

The photograph at the right, taken during the tests, shows how quickly milk flows through the Rapid-Flo Disk. Rapid-Flo combines accuracy with speed—it gets all the dirt in the shortest possible time. It is made under the same rigid sanitary conditions as the world-famous Johnson & Johnson surgical dressings and hospital supplies.

Regardless of the high quality of the milk you produce, you can not get top prices for it if you ship it to market containing dirt and sediment. Test Rapid-Flo Disks at our expense. Send the coupon below for free sample disks.

GET THIS FILTER DISK CABINET FREE

For a limited time your dealer can supply you with this attractive, convenient, steel disk storage cabinet (retail value \$2.50) free with an initial purchase of two cartons of Rapid-Flo Filter Disks. With the aid of this cabinet your disks are kept clean and dry and are within instant reach. Mail the coupon below for Free Samples of Rapid-Flo Filter Disks and complete information of the Free Sanitary Disk Cabinet.

This attractive cabinet hangs on the wall in the milk house, up out of the way. Holds 600 disks. Hinged drop-front makes removal easy when supply is half-used up.

sires to sell milk and such other information as may be required by the Secretary.

Persons selling milk wholesale to a milk plant do not have to take out a permit. In such cases the milk plant must secure the permit and attend to the sanitary inspection of the dairy farms from which it receives the milk.

The regulations concerning the production of raw milk include the tuberculin test of the cows and handling in such a manner that the milk will be clean and free from disease producing organisms, prompt cooling of the milk, protection of the milk and cleaned containers from flies, proper construction and cleanliness in the milk house or milk room and an adequate supply of steam or hot water for cleansing purposes.

The regulations concerning pasteurized milk do not require the tuberculin test of cows but do require the observation of the other factors such as mentioned in the production of raw milk. Pasteurized milk is defined as milk heated to such a temperature and for such a length of time that all harmful organisms are destroyed.

No one who is keeping a dairy herd free from tuberculosis and who is observing a fair degree of cleanliness in producing a sanitary quality of milk need have any fear of this new law. On the other hand the act will be helpful in safeguarding human health in case the dairyman keeps unhealthy cows or is not observing reasonable cleanliness in the operation of his dairy.

Any one interested may secure a copy of the act and the regulations for its enforcement, also application blanks for permits, by writing directly to the Pennsylvania Bureau of Health, Harrisburg, Pennsylvania.

The Story of Woodbine Farm

By W. D. ZINN

CHAPTER X

1912 the University of West Virginia employed Professor C. R. Tidlow, of Ohio, as Director of Agricultural Extension work in the State. Under his enthusiastic leadership an extension program for agriculture was outlined and subsequently put into effect which was second to no other state. As a part of this program it was decided to undertake an extension program in agriculture to interest farmers and business men in employing a man in each county who would devote his entire time to the interests of the agriculture of the county.

At a beginning in this movement, a man was lent to the Chamber of Commerce of Charleston in finding a man to undertake the work in Kanawha county. Mr. E. B. Zinn was finally chosen and qualified himself as the first county agent in West Virginia. The following letter written in response to a request for information of his early experiences in this work is of especial interest in connection.

Early Experiences
March 25, 1927

W. D. Zinn,
West Virginia.

Dear Sir:
In receipt of your letter of March 1st I am pleased to know that you are preparing a book covering the history of the county agent work in West Virginia. The first thing I did when I arrived in Kanawha county, as I had not had any experience in county agent's work, was to secure a horse and saddle and go through the mud and hills of Kanawha county and study farm conditions. I found that at the same time getting acquainted with the farmers and their boys and girls. That time in the United States Department of Agriculture, through the Office of Farm Management, furnished me with blanks which asked various questions about the farm operations, farm expenses and profits. These blanks were in questioning farmers and, after being filled out, the farmer was asked to

remember well one incident that I had in my first efforts. One day, I had got the information from the farmer and his wife which I desired. I went back to the farmer to sign the blank. He stated that there had been a shipment of books and a bill for them. I did my best to convince him that I was not a book agent, but he refused to sign the blank until I gave him the information concerning his

quite a job securing the interest and cooperation of the farmers in the county, as the work was entirely new and no one had ever heard of a county agent. At that time I was known as the farm expert and not county agent. I had to explain to the farmers that I was not a county agent, but a man who was sent to the county for a few months, and then to get quite a little publicity from the local papers as county agent. I began to receive numerous letters and invitations to visit nearly every farm in the county which, as you know, is an impossibility.

I know from your experience in Kanawha county that real orchard men are not every little orchard owner was interested and wanted me to assist in the spraying work. This I did and I could and found this a good end result.

I started work in this county six months ago and was selling about sixty to eighty dollars per ton of fertilizer. It was being used, even though it was badly needed to grow most of the crops. This material was selling for twelve to fifteen dollars per ton.

The work was started in this county there were no dairies. The few that were producing milk were doing so under conditions in and around the dairies which were intolerable. I am a milk drinker, but after I saw the conditions under which this milk was produced I was a total abstainer. I saw that at that time, and now have, a few dairies showing the conditions around the barns or so-called dairy barns. The great obstacle confronting me at that time was to get the cooperation of the farmers. This was gained by personal visits and by treating each person and each farm with the proper respect and keeping word and dates to the letter. I do not know whether the above information will be of any value to you or

Sack-of-Silage just what your cows need now

AND they need it all year, too. During winter months in place of pasture. In Spring when silage gets low. In Summer when pastures are "tired."

Succulent, palatable Sack-of-Silage keeps cows happy, and the milk pail full—at surprisingly low cost.

More digestible nutrients, more lime, more bulk than wheat feeds,—Sack-of-Silage is a wonderful conditioner because of its combined laxative and toning-up effect on your entire herd.

Get more milk now, and at the low cost which makes profits.

Since 1842 four generations of the Eshelman family have been in the feed business. The men who make Eshelman feed for you are most of them farm-raised. They bring a knowledge, an interest, a pride to their work—which produces better feed.

Grow more potatoes by this easy, quick seed treatment

**Semesan Bel saves time and labor
Produces vigorous stands
Increases yields**

Safe seed potato treatment to kill surface seed-borne disease organisms is a highly profitable practice. Yield increases and improved crop quality have shown this beyond doubt.

But seed potato treatment need not be an all day job. If you have been using old soak methods—wasting an hour and a half to two hours on one lot of seed—you should know about Du Bay Semesan Bel, the safe and effective one-minute dip disinfectant.

Instantaneous treatment

Semesan Bel is instantly applied to seed. No hot water or time-wasting soaking. Just dip the seed potatoes and plant. With this rapid method, one man alone can easily treat as much as 400 bushels of seed a day.

Increases potato yields

By controlling surface-borne infections of rhizoctonia, scab and black leg, Semesan Bel produces vigorous field stands, improves crop quality and increases the yield per acre.

not, but if it is I give it to you for what it is worth.

Very truly yours,
E. E. Ezell.
Second County Agent

Some time later the second county agent, H. S. Vandervort, was employed in Wood county. The following letter from Mr. Vandervort is self explanatory.

Morgantown, W. Va.
July 9, 1924.

Mr. W. D. Zinn,
Phillippi, W. Va.
Dear Mr. Zinn:

During the summer of 1912, a number of the business men of Parkersburg, through their Chamber of Commerce, became interested in better agriculture for Wood county, and especially in a better understanding between the town and country people in Wood county. They called upon the Director of Extension and the U. S. Department of Agriculture to give them assistance in working out this problem.

The Extension Department and the U. S. Department of Agriculture recommended that they cooperate and use funds from the Chamber of Commerce, and U. S. Department of Agriculture to employ a county agent.

An arrangement was worked by which the Board of Commerce appropriated, in cooperation with the Department of Agriculture, sufficient funds to pay a salary of \$125 a month and traveling expenses of the county agent. I was selected for this position and began work on December 1, 1912. The first thing worked out was the selection of influential farmers and business men as an agriculture committee. This committee outlined plans and worked out a plan of work for advancement of agriculture in Wood county.

The success of the work in Wood county was due largely to the agricultural committee, and especially to its chairman, Judge Reese Blizzard. Every member took great interest in arousing the desire for better agriculture in the county. I was able to reach a large number of people through these local committeemen. The first work consisted largely of getting more silos, better feeding practices, proper drainage and proper care of orchards.

Work in the county has been growing very fast, and it has been largely accomplished because of the fact that the town and county people realize that the county agent and Farm Bureau work together for the betterment of the county. As a whole the Parkersburg Board of Commerce has always cooperated and it has been possible to continue the county agent work without interruption since 1912.

Very truly yours,
H. S. Vandervort,
Assistant Director.

The third and fourth counties to employ county agents were Ohio and Brooke. Some years before this was done the Panhandle Agriculture Club had been organized. This comprised the counties of Ohio, Brooke and Hancock, and in 1913 this club hired the author and W. H. Sill to take charge of the work jointly in Ohio and Brooke counties. I was to give instructions in soils, crops and livestock, and Mr. Sill was to look after the horticultural and floricultural end of the work.

What to Do

I knew very little about the duties of county agents when I went into these counties. Before going into the work I wrote one of my superiors asking him what I should do. His reply was, "Mr. Zinn, go up and look around and see what needs to be done, and work at the job that needs doing worst."

I felt that what I should do was to get acquainted with the farmers that I might know their needs. Several months were spent visiting farmers, inspecting farms and holding meetings in central places. One thing that impressed me was that in this very hilly country farmers were plowing entirely too much. This was a bluegrass country and better adapted to grazing than to farming. But if livestock were kept something must be grown with which to winter them.

Lime being abundant and cheap I decided that farmers alfalfa. This plant had been tried on perhaps less than a dozen farms in the two counties, but in most cases the attempt to grow alfalfa had been successful. The matter of putting on an alfalfa campaign was brought to the attention of the club, and it was voted unanimously that the agents should bend their energies in that direction.

I was 125 miles away from my home, and could get home only every

two weeks. After some months I decided I could not afford to be away from my farm so much, so I resigned, thinking I would quit the county agent work. I was sorry to leave these good friends, for during that time I had formed friendships that were very pleasant, but I am glad to say they still exist, for once in a while I get back to Ohio and Brooke, and renew these ties.

A Second Appointment

No sooner had I returned home than the Extension Department asked me to be county agent in Barbour and Randolph counties. Barbour county being my home county it seemed much easier to me to undertake the work, so I accepted a second appointment. I was to spend one week in Barbour and one in Randolph. Later Randolph county was dropped so that I could have more time at home. I was really enjoying my work, and feeling that I was getting something done. The truth was I was giving more than half my time, for I was in the field three days, and did my office work and kept up my correspondence at other times.

Up to this time Harrison county, which joins Barbour, had had no agent. They had effected an organization, and for a year had been looking for an agent. The executive committee consisted of F. B. Davison, Harvey Harmer, John D. McReynolds, Jackson Arnold, C. P. Hood, Howard Gore (later Governor), J. S. Pigott, Burgett Swisher, and one or two others.

This body sent a committee up to Barbour county to see if it could induce me to take the work in Harrison county, for I was thinking of closing my work in Barbour soon, and giving all my attention to my farms, which at that time began to show that they needed closer supervision.

(To be continued.)

Kudzu

Would like to ask of the relative value of kudzu which Charles Leach of Florida claims you recommend.
Harvey Miller.

I HAVE spent more time answering letters relative to kudzu during the last eight or ten years than any other one plant. I received 157 letters in one week, and that was the next week after Mr. Leach wrote his article on "Kudzu Better than Timothy." He and I had a lengthy correspondence over the matter and in one of his letters he intimated that I did not know anything about kudzu and offered to send me some roots. In reply to this letter I said that kudzu was growing all around Phillippi for an ornament under porches and houses where it was protected from the hard freezing of the winters. Mr. Leach omitted part of what I wrote him and quotes me as saying, "Kudzu is growing all around Phillippi." Had he quoted me in full this ad would not have been worth anything to him. In almost every letter I wrote him that I did not believe kudzu would do any good in the North. I leave it to my readers to decide whether he treated me fairly.

Director C. G. Williams of the Ohio Experiment Station told me personally that they had tried it at the Station and it winter killed each time. It, no doubt, does well in the South, but so do oranges and lemons, but I have never heard of farmers growing oranges and lemons in Pennsylvania.

Letters are coming to me from the Middle West and from the East quoting what I have said about kudzu in Mr. Leach's circular. To all these inquiries I have said that Mr. Leach failed or forgot to tell the whole truth. If any of my readers in the North have invested money in kudzu on my so-called recommendation and have lost it I am sorry. My object in writing this article is to repudiate the so-called recommendation and to give the facts in regard to the matter.

Your Cows Are Worth a Better Feed! . . .

YOU could cut your dairy feed down to hay and silage, and still get a certain amount of milk. But profits come from getting all the milk the cows can produce.

A dairy herd working part time or producing below capacity is like a factory with part of its equipment idle. If it pays to feed cows at all, it pays to feed the best milk producing ration obtainable.

That is why so many dairymen feed Gold Medal Dairy Ration. It makes money for them. The consistent quality of Gold Medal keeps cows in good shape for continuous high production. The extra milk is extra profit every week, and every month, consistently.

The Gold Medal "Farm-tested" formula is based on years of research and experimental work. The ingredients are selected and blended with the utmost care and skill, for Gold Medal Dairy Ration is made by the makers of Gold Medal "Kitchen-tested" Flour.

Your cows deserve Gold Medal, because it lets them do their best, and that means that you get a bigger milk check.

Farmer's Business Letter

THE employment situation may be improving, as reports from Washington state, but none the less there is a decided feeling in livestock trade that demand for meats has been seriously curtailed by the large number of people out of work.

Livestock Marketing
Organization of a livestock marketing association was started in Chicago this week at a meeting of representatives of the Federal Farm Board and leading cooperative livestock marketing associations.

The plan, accepted by certain of the cooperatives, calls for the incorporation of the National Livestock Marketing Association, with a capital stock of \$1,000,000, to operate on a basis similar to that of the grain marketing corporation. Two subsidiaries, the National Feeder and Finance Corporation, and the National Livestock Publishing Association, also were planned.

The project will be submitted to the boards of directors of the various cooperatives for approval before it is put into effect.

Light Demand for Beef

Greatly reduced receipts helped to hold the cattle market up this week. The run here was only 35,000 against 42,000 last week, and the combined total at leading markets was correspondingly reduced for the week.

Demand for beef continued light. Beef to the consumer is high, and sales are affected by reduced employment. All kinds were some lower this week except the best grades of steers, and they were scarce. A top load of light steers brought \$15.75, highest in some time. Average price of steers for the week dropped to \$12.25, against \$12.50 last week.

There has been some increase in the movement of feeder cattle, indicating that producers have confidence in the future. But relatively cheap feed favors feeding.

Hogs Fluctuate

The hog market this week was featured by sharp reductions and sharp advances, the latter about offsetting the former, as shown by the fact that average price for the week, at \$10.80, was the same as last week, but a nickel below a year ago when prices were working upward.

Receipts at eleven markets this week totaled 600,000, against last week's very light run of 578,000. Light marketing and prospect of the same favor higher prices, but demand for product has been showing weakness resulting in buying caution.

So far this year eleven markets have received 5,701,000 hogs, against 6,117,000 on the same date last year, and 7,339,000 two years ago.

The hog futures market opened today with quite a program of speaking, and a large attendance of interested spectators. There were scattering quotations. Reports on futures prices will be available next week.

Lamb's Again Lower

Lamb prices dropped off as much as a dollar more this week. Tops for the week opened at \$11.70 and dropped off steadily to \$10.50 on Thursday, with some recovery later.

Receipts were a little larger than last week, 79,000 here this week against 72,000 last week and 70,000 a year ago. Average price of lambs dropped to \$10.45, against \$11 last week and \$16.45

a year ago.

The general average price of lambs for February at \$10.55 is lowest since December, 1921. Barring the year of 1921, the average goes back to October, 1916, for a lower average. At a low point in 1921 the monthly average was down to \$8.55 in October. The year's average in 1921 was \$9.85. Previous to 1915 all monthly averages were in 3 figures.

Lamb from the corn belt made up most of the increase in February. Shipments from leading states in the West are running only slightly larger than a year ago and smaller than two years ago, but they have plenty of lambs to come. About the best that can be said for lamb just now is that it is cheaper than pork or beef, but that does not relieve the heavy losses of feeders.

Board Features Wheat Trade

Farm Board operations in wheat are so involved that probably not even the Board's experts know just what moves they will make next, or can interpret intelligently the effect of what already has been done.

SPINACH, 15¢18¢ ¼ pk. TOMATOES, 25¢30¢ pint box. TURNIPS, 15¢ ¼ pk.

March 8, 1930

By heavy buying, through its subsidiaries, the Farmers National Grain Corporation and the Grain Stabilization Corporation, the decline in wheat prices was checked, and some recovery was effected. And it appears that through these operations, some time, rather than farmers, have made big profits, and further that unless the Board is able ultimately to sell the wheat at the price it has paid, Uncle Sam will foot the bill. Frank J. Taylor, chairman of publicity for the Omaha Grain exchange, charged that "the government has entered the field of wheat speculation by action of the federal wheat stabilization corporation in buying options in the futures market."

Stating that the "laugh is now on the government," Taylor called attention to "years of time and barrels of printers' ink" used by the government in criticism of grain exchanges and futures trading, ending in its own funds being used for that purpose.

No report of the price trend has much significance at this time, since the law of supply and demand has been nullified for the time being. The great experiment is under way and the outcome will be watched with interest. Chicago, March 1, 1930. Watson

YORK

Butter.—Country, 45¢50¢; separator, 41¢55¢.

Eggs.—Fresh, 30¢32¢.

Poultry.—Hens, live, 28¢32¢ per lb. Leghorns dressed, \$1.25¢1.50 each; heavy, \$1.50¢2.25 each.

Fruits.—APPLES, 10¢30¢ ¼ pk. Stayman, \$1.75¢3 per bu. Yorks, Grimes Golden, \$1.25¢1.50 per bu. CABBAGE, 10¢15¢ head. LETTUCE, 10¢20¢ head. OYSTERS, 8¢10¢ doz. TURNIPS, 10¢13¢ ¼ pk. SPINACH, 15¢20¢ ¼ pk. CELERY, 5¢15¢ per stalk. PARSLEY, 20¢30¢ per bunch. SWEET POTATOES, 15¢20¢ per quart.

PITTSBURGH

Butter.—Creamery prints, 92 score, 41¢; tubs, 40¢40¢; local tubs, 37¢41¢.

Eggs.—Select white, 27¢30¢; brown, 24¢26¢; current receipts, 24¢26¢.

Philadelphia Produce Review

THE Philadelphia egg market opened in a very weak and unsettled condition with all grades undergoing drastic price declines. Unusually warm weather which occurred throughout most of the country no doubt had some bearish effect on the market. The sharp reduction in quotations and the heavy arrival of goods created a nervous situation and buyers were reluctant to operate beyond immediate requirements.

Toward the middle of the week a steadier tone developed but in some quarters a degree of uncertainty was manifest. Some Southern stock was available at slight concessions, however, eggs of fancy quality brought small premiums and were fairly well cleared. At the closing of the week trading slowed up somewhat as most channels were overstocked. Refrigerator eggs were scarce with most sales reported at irregular quotations. Practically all outlets were working on fresh eggs.

Receipts in New York were liberal during the latter part of the week and the market developed a weaker tone. Most trade channels were overstocked. White eggs were very irregular in price and dealers were anxious to find a price level that would induce more active trading. Nearby white eggs were quoted at 29¢33¢ per dozen, mixed colors at 21¢29¢ and brown eggs at 30¢32¢.

Poultry Active

The New York live poultry market was more active during the latter part of the week. Receipts of nearby fowl were light in supply and sold readily. Chickens met a good demand and broilers were active with prices advancing. Old roosters and geese were also wanted. Cooled fowl were quoted at 35¢ per pound and Leghorns at about the same level. Chickens ranged from 28¢32¢ and broilers at 36¢42¢.

Dressed poultry was dull with fowl more than ample for trade requirements. Some holders were cutting prices in an effort to reduce stocks on hand. Dressed hot house broilers were in light supply, and sold readily when fancy and well graded. Prices on this stock ranged from 25¢46¢ per pound depending on quality.

Potatoes Dull

The potato markets were generally weak and dull during the week with liberal supplies. Prices have declined both at shipping points and at terminal markets and growers are again reducing their shipments. There are some who believe that prices have reached the bottom but there does not appear to be much chance of a quick recovery.

Whenever prices at shipping points drop this season the shippers and growers are reluctant to sell and with lighter shipments the market improves. Prices at Maine shipping points are now around \$2.00 per 100-pound sack f. o. b. and around \$3.40¢3.50 per 150-pound sack at New York points. In Philadelphia round whites from Pennsylvania jobbed at \$2.25¢2.65 per 100-pound sack and at \$2.25¢2.75 in Baltimore.

Apples Weaker

The apple market has shown a weaker tendency during the past week. The warm weather is blamed for the increase in scalded apples coming out of cold storage. This has been very noticeable the past week. Dealers report that it is more difficult to sell apples above \$2 per bushel although some good stock still sold around \$2.50. Rome sold at \$1.75¢2.25 per bushel in Philadelphia. Stayman at \$1.50¢2.50. Yorks, Nero and Grimes Golden at \$1.25¢2 and Ben Davis at \$1.15¢1.50.

Sweet potatoes were quiet in most all markets. The warm weather was partly responsible for the lack of demand. New Jersey stock sold at \$1.25¢2 in New York city with a few bright fancy lots higher. The movement in Philadelphia was very slow with prices generally around 75¢\$1.10 per ¼ baskets. Reds were relatively weaker than yellows. W. R. W.

LIVESTOCK

PITTSBURGH

Cattle

Supplies continue light and the demand is lighter than usual because of the advent of Lent. Only 30 carloads were offered on Monday. Buyers bid below last week's prices on the better classes of steers but finally paid about the same as then. Common to medium light butcher steers looked a little stronger. Two carloads of long-fed heavy steers brought \$13.60, a dime more than last week's top, but they were thicker than anything here then. A few steers brought \$13.25, well-finished but not weighty, and good fat hinds and weights went at \$12. Very useful killers with weight could be had at \$12.50¢12.75. Useful fleshy butcher steers brought \$11.75¢12.25, and ordinary kind with some flesh \$11¢11.25. Not many heifers were here. A couple of choice yearlings brought \$12.60, but few were good enough to sell at \$11 or better. Fat cows were weaker, with fat cows \$8.50. Choice heifers, little change. Bulls were lower, with few above \$9, though an occasional heavy butcher bull would bring more. Bulk of bologna bulls went at \$8¢8.50.

Prime fat steers, 1300 lbs. or over, \$12.00¢13.00. Choice steers, 1200 lbs. or over, \$12.00¢13.00. Good to choice, do., \$12.00¢12.50. Fair to good, do., \$11.00¢12.00. Plain heavy steers, \$11.00¢12.00. Choice handy-weight steers, \$12.00¢13.00. Good butcher steers, 1000 to 1150 lbs., \$12.00¢12.25. Fair to good, do., \$11.00¢12.00. Ordinary to fair, do., \$10.00¢11.50. Common, do., \$10.00¢10.50. Good light butcher steers, \$11.75¢12.25. Fair to good light steers, \$11.25¢11.75. Common to medium, do., \$10.50¢11.25. Inferior light steers, \$9.00¢10.00. Feeders, \$8.00¢9.00. Stockers, \$8.00¢11.50. Choice fat heifers, \$10.50¢11.00. Good to choice heifers, \$9.75¢10.50. Fair to good heifers, \$9.00¢9.50. Common to fair heifers, \$8.00¢9.00. Choice fat cows, \$8.75¢9.00. Good to choice fat cows, \$8.25¢8.75. Fair to good cows, \$7.50¢8.25. Common to fair cows, \$5.50¢6.50. Canners, \$5.00¢15.00. Fresh cows, good at all times, \$8.75¢9.00. Choice heavy bulls, \$8.50¢9.00. Choice handy butcher bulls, \$8.50¢9.00. Choice heavy bulls, \$8.50¢9.00. Fair to good bulls, \$7.50¢8.00. Common to fair bulls, \$6.50¢7.50. Inferior bulls, \$6.00¢6.50.

Monday's supply was about 30 double-deck carloads. The market was active and 15¢20¢ higher than last week's close. Some plain Iowa hogs were on sale and they

With about 550 calves on sale trade was good at \$15.50 for tops, \$11¢13 for seconds and \$8¢10 for culls.

Calves

Good to best weathers, \$6.75¢7.25. Good mixed, \$6.50¢6.75. Fair to good, do., \$5.75¢6.50. Common to fair, do., \$4.50¢5.50. Inferior sheep, \$3.00¢4.00. Good to best lambs, \$11.00¢11.25. Medium lambs, \$10.00¢10.50. Culls and common, \$8.00¢9.50. Heavy lambs, \$9.50¢10.50. Clipped sheep, \$3.00¢6.00. Clipped lambs, \$7.00¢10.00.

Cattle

Lancaster, March 3.—With 150 head of cattle on sale the market was generally show. Steers and yearlings were steady, brought \$11.25 and best clipped lambs \$10 per cwt. Not many choice lots of either kind were offered. Heavy lambs sold largely at \$9.50¢10 with wool on, a few not much above \$9 lbs. \$10.50. No spring lambs have appeared.

Lancaster

Lancaster, March 3.—With 150 head of cattle on sale the market was generally show. Steers and yearlings were steady, brought \$11.25 and best clipped lambs \$10 per cwt. Not many choice lots of either kind were offered. Heavy lambs sold largely at \$9.50¢10 with wool on, a few not much above \$9 lbs. \$10.50. No spring lambs have appeared.

Hogs

Eleven hundred head made up the supply of hogs. The market was steady. Best hogs in the 160 to 200-lb. class brought \$12.75.

Make Money

DREW POULTRY BOOK

You Need This FREE Poultry Book

If You Want More Eggs Faster Growth and Bigger Profits from Your Poultry

Send for this valuable new Book today and find out how you can make more money with Drew Line up-to-date Poultry Equipment.

See how Drew Line offers you a short cut to bigger poultry profits at lowest cost. Just compare Drew values with others and see how you can save money—

Mash Feeders
Waterers, Nests
Brooder Stoves
Baby Chick Equipment
Ventilation Systems, Etc.
Drew Line has helped thousands of poultrymen make more money.

For years Drew has offered a complete line of good reliable Poultry Equipment—the kind that you can always rely on to give long service with utmost satisfaction. If you want to save money and get the most value at least cost, then don't fail to send the coupon for this New Drew Poultry Equipment Catalog Now.

Mail the Coupon Today
The Drew Line Poultry Book shows all the latest improved types and styles of Poultry Equipment. Because Drew Equipment is so reasonable in cost, every poultry raiser can afford to have this profit-making Equipment. Just check the items in which you are interested and mail the coupon for this FREE Book Now. Poultrymen who expect to build or remodel will also find in it information about Drew Ventilation—how it adds to poultry profits.

A New Kind of FENCING!

More Rust Resisting—Lasts Years Longer

Jim Brown's
New Copper Steel Wire

My Prices
Low as
1 1/2¢
Per Running Foot

Jim Brown's
Bargain Book

Much Better Fencing for Less Money

At last I have it, and am now offering to the farmers of this country my NEW COPPER STEEL longer-lasting fencing direct from my factory at low factory prices with all freight charges paid. Its double life means a saving of half your fence money!

This amazing NEW kind of fence wire is the result of a discovery which makes Brown fencing far more RUST-RESISTING and durable than any fence made in any other way. It's accomplished by using the proper percentage of Copper with the Steel. This remarkable process is the result of many years' experimenting to find a way to conquer rust, and according to tests made during the past 17 years by Steel Manufacturers, as well as by the American Society for Testing Materials, Copper Steel has proved to be at least twice as durable as Non-copper Steel!

Don't buy a rod of fencing until you get my New Catalog and learn all about this New "longer life" fencing which is sold

Direct From Factory—I Pay the Freight

My new catalog tells all about this AMAZING NEW DISCOVERY! Also tells how I add still more EXTRA years to the life of this longer lasting fence by coating the Copper Steel wires with a heavy coat of Super-Zinc Galvanizing—and how my Direct From Factory plan of dealing enables you to buy my New longer-lasting fence for less than you pay elsewhere for ordinary fence.

In addition to over 150 styles of Farm and Poultry Fencing, my new catalog also contains wonderful factory bargains in Steel Posts, Barb Wire, Steel Gates, Metal and Roll Roofing, Paints, Tires, Tubes, Cream Separators, Furnaces, Heaters, Stoves, Fruit Trees, Shrubbery, Baby Chicks, Brooders, Poultry Supplies, etc.—128 pages of Money Saving Bargains in farm and household needs.

Easy Payments Too!

Another big advantage for my customers is my NEW Easy Payment Plan. You can now order what you need—pay a little with the order and balance in easy monthly payments.

Over 1,000,000 farmers have learned that my Straight Line Selling Plan saves them a lot of money every year. One million satisfied customers is a lot of folks—I could never have built up such a large business had I not always given my customers Better Quality, Lower Prices and Better Service than they could get elsewhere.

Saved \$50

Dear Jim:—Just received my last shipment of fence and it is the talk of the neighborhood. I know you saved me \$50.00. I have lent my catalog to a neighbor who wishes to fence 20 or 25 acres. I'm proud of my fence. It is better than I expected.
J. N. WALKER, Monroe, La.

Saved One-Half

I received my fence, also posts and gate and do want to thank you. Am surely pleased, as you saved me quite a bit. I couldn't have gotten as good a fence here for twice the price I paid. Always Brown's in the future.
J. J. CARROLL, Eastport, Maryland

Send for My Catalog Today!

Remember everything you buy from my factories is guaranteed—you take no risk. The low prices in catalog is all you pay—I pay the freight—Jim Brown has ALWAYS paid freight charges. Orders are filled within 24 hours from my factories at Cleveland, Ohio, Memphis, Tenn., and Adrian, Mich.—also from 35 other shipping points—no matter where you live I can serve you promptly and save you a lot of money. MAIL COUPON FOR CATALOG NOW.—JIM BROWN.

This buying guide to QUALITY

—now offered by your A. S. A.

FARMERS have welcomed this new Swift Certificate of Quality as their surest buying guide! For it assures: **BEST MATERIALS**—plant food selected from most productive sources.

DOUBLE MIXED—fertilizer thoroughly and evenly mixed and in good drilling condition, so that each plant will get its share of plant food.

TRIPLE TESTED—in fully equipped laboratories. This assures the right kind of plant food, in the right form and correct amount.

"Guaranteed analysis" guarantees the amount of plant food only. This certificate assures quality!

Look for this sign of your A. S. A.

Red Steer's quality for you means bigger yields and better quality crops.

Ask your Authorized Swift Agent to tell you more about 7-11-7; 3-12-15 and 4-16-10. These high analyses give you your plant food for less money.

If you can't locate your A. S. A. at once, write to the nearest Swift Fertilizer Works.

"It pays to use them"

BEST MATERIALS—DOUBLE MIXED—TRIPLE TESTED

Farm Facts and Fancies

By ALVA AGEE

THE American Indian was a true scientist in fertilizing corn. He put the fish into the hill where the plant would start life. We might tell him that the roots would spread through the soil and should be able to get food most anywhere, but he knew where the limited amount of fish he would use should be placed.

Doubtless he could have grown better corn if he had used double the amount of fertilizer and placed some between the rows, and yet even then the question is whether the extra portion would not have given more corn if it too had been placed near the plants when making their first growth. The answer would depend on the amount available for use.

When Applying Fertilizer

I am trying to emphasize the fact that a young plant needs food near it, and plenty of it, and when that has been supplied we may be concerned that the rest of the ground should have fertilizer supplied to it. Years ago we criticized hill fertilization, and talked of the spread of plant roots everywhere, but there is evidence enough that it is good practice when done right.

It is all wrong to dump a lot of fertilizer where it cannot be mixed with the soil, and a heavy application in the hill that is not mixed with the soil burns tender plants. There is more injury from this cause than many realize. We have no mechanical means of doing a thorough job of mixing in an area of, say, a foot square, but I think it is a fact that if we did have such means we should find returns from the investment decidedly greater than when the fertilizer is scattered throughout the soil. Theoretically maybe it should not be that way, but practically it probably is that way.

There has been much improvement in planters so that heavy quantities of fertilizer can be safely used in the row. There is not the thorough mixing with all the soil in which the plant forms roots that gives perfect conditions, but we get away from any serious injury to seed.

Fertilizer in the Row

I have known good potato growers who half-believed that the middles between the rows should have been well supplied with fertilizer because they knew that the roots filled the middles when tillage was stopped, but they continued to put fifteen hundred pounds in the row because it paid them to do so. Where the biggest possible yield is wanted more fertilizer is used, and no one questions that it is good practice to broadcast some part of a very heavy application.

Fertilizer Broadcast

It isn't easy to stress any fact and not leave other truth too much out of sight. The need of plenty of fertilizer just where a plant starts life, and where there is a mass of roots later on, does not prevent us from seeing that all the ground should be rich if we can make it so with profit.

The point is that hill and row fertilization for any kind of crop needs no apology—plants like it and pay for it more easily than they do for broadcast food. When the investment in fertilizers is the least limited the returns are biggest from that put near the plants.

Certainly this is true in the experience of potato growers and growers of most, or all, kinds of plants, and the statement appears justified by the results obtained with corn by the Ohio Station.

Termites

"They did work willily." This is the ancient record of the Hittites and Amorites and Jebusites when the

Children of Israel would dispossess them of their land. There is no better description of the methods of our more modern enemy, the termites. They are a menace to buildings from Washington, D. C., to Los Angeles. One kind works in dry wood, finding or making a tiny entrance and then destroying the inside of the sill or studding. Another works in damp wood where a sill or flooring is too close to the ground. The disconcerting thing is that a lot of damage may be done before these pests are detected. The first warning often is the settling of the building as the wood gives way.

The ones working in damp wood are circumscribed in considerable degree by having plenty of air circulation under the building. I secured this by having soil removed, and then a heavy coat of creosote was applied to warn any vanguard away. My neighbors thought I was too fearful, and now inspectors find some of their houses infested, and experts are trying to kill these pests with poisons. A trouble is that a connection between two large cavities within the timber may have been closed by the workers, and the termites are not exterminated.

I suggest that any of our readers who have buildings close to the ground make careful inspection, and personally I have more faith in fresh air and creosote as preventives than experts' treatments as permanent cures. The termites that attack dry wood need expert attention. They "work willily."

Merchant Credit

The U. S. Bureau of Agricultural Economics says: "As in other years cost of merchant credit, especially in the South, continues to be much higher than the cost of other principal forms of credit. For this reason farmers should, whenever possible, use credit from banks or other specialized credit agencies."

There is another reason some overlook, and often a more weighty one than the extra cost of credit. Probably nine out of ten of us find it easier to decide to buy something when the amount will be charged than we do when cash is to be paid, even though we have the money in our pockets.

Installment buying and charge accounts make it difficult today for young people to get ahead and older people to stay ahead. When one knows that he is going to count out the money at time of purchase he has a way of weighing more closely the relative merits of the proposed purchase and the money demanded for it. Then, too, the man who runs an account at a store knows that he can stave off payment of a store bill more easily than a note in bank.

What he needs is aids to doing without when cash capital is small, and a note in bank for absolutely necessary money is a far better check than merchants' credit. He knows exactly what he owes, and when it is due, and the upshot is that he not only gets cheaper credit but he needs less money because he holds back from unnecessary buying. Young farmers especially should think this out and finance their needs outside of merchants' credit.

Rhubarb Rules

GROW rhubarb from root cuttings. Fertilize the ground first with plenty of manure or a good garden fertilizer worked into the soil at the rate of a pound for every four plants.

The roots should be covered four inches deep, two or three feet apart in the row and the next row four feet off, if you have more than one row. Fertilize every year at the time of planting. Keep weeds and grass off. Break off flower stalks if they start

THE GENIUS OF MAYTAG Presents a NEW WASHER

for Farm Homes with or without Electricity

The NEW Maytag surpasses all other Maytag achievements as definitely as previous Maytags have blazed the trail of washer development. The NEW Maytag is the result of unmatched Maytag resources and equipment... product of the skill and science of the world's finest washer craftsmen. The NEW Maytag is made in the world's largest washer factory. The NEW Maytag is a \$4,500,000 product.

FOR THE FIRST TIME, a washer is equipped with a NEW one-piece, cast-aluminum tub.

FOR THE FIRST TIME, Maytag offers a NEW Roller Water Remover with enclosed positive-action, automatic drain.

FOR THE FIRST TIME, Maytag presents a NEW, quiet, lifetime, oil-packed drive with handy NEW auto-type shift-lever.

These and other features give the latest Maytag triumph new results—new convenience, new washing ability. You must wash with the NEW Maytag to appreciate it.

The Gasoline Multi-Motor

This Maytag engine is interchangeable with the electric motor by removing only four bolts. It has only four moving parts, flood-proof carburetor, high grade bronze bearings, Bosch high-tension magneto and speed governor, and a new air-cleaner. "Step on It" and away it goes. Built for women to operate.

Aluminum Power Churn and Power Meat Grinder Attachments are also available with the Maytag as extra equipment.

FREE FOR A WEEK'S WASHING

Write or phone the nearest Maytag dealer for a NEW Maytag equipped with either an Electric Motor or gasoline Multi-Motor. If it doesn't sell itself, don't keep it. Divided payments you'll never miss.

Dust Seed Treatment Controls Oats Smuts without Seed Injury

Quick, Easy Method Increases Oats Yield

Past experience of many farmers has proved that mussy and old-fashioned methods of treating seed to control oats smuts are often harmful. Liquid treatment with formaldehyde sometimes injures as much as 30% of the seed. Further injury may result from freezing, heating or sprouting; or when seed is sown in dry soil.

Now there is an effective new method of seed oats treatment. And one that is safe. Applied by the quick dusting process to seed oats, Du Bay Ceresan kills smut organisms without injuring the seed.

Ceresan Prevents Smut Damage

State and federal crop authorities report that oats damage by smut was unusually severe in Iowa, Missouri, Kansas, Minnesota and Wisconsin in 1929. The preceding year, Iowa alone lost 18,000,000 bushels to smut.

Ceresan can prevent such tremendous losses from loose and covered smuts. Tests have proved it. For example, Wisconsin Circular 133 states that Ceresan has given very good control of oats smuts in that state. The *Plant Disease Reporter* for August, 1929, reported that dust treatment with Ceresan gave "good control" of oats smuts in Iowa, and in Kansas. Ceresan dust treatments gave "excellent control" of oats smuts.

Three half machines. It need never be used. Main feature is the three speed gear. Patented two speed. Gauge wheel regulates depth of cultivation. Special Offer—Write for Picture Office and Free Catalog. Address: SHAW MFG. CO., Gatesburg, Pa.

A WRITER from Allegheny county, Pa., among other things says: "I am going to apply about one pound of nitrate of soda to the 1,000 young apple trees set in the spring of 1928, and I bet they will grow. I am also going to paint the trunks with paraffin."

Yes, a pound of nitrate should make the trees grow. In fact, it is more than I would give them at that age. One-half pound would be a more economical application at that age, and it should be scattered over an area having a radius of five or six feet out from the trunk. The writer also says he is going to apply mulch paper around the trees, because the dry weather last season prevented growth.

I have no information on the use of mulch paper on young trees. But I am of the opinion that clean cultivation throughout the summer would be cheaper and more satisfactory. We have been growing cultivated crops between the tree rows during the first four or five years, not planting more than five or six rows of crops and thus leaving a space beside the trees eight to ten feet wide. If any one has tried paper mulching in growing young trees I am sure others would be interested in the results. As for painting the trunks with paraffin, why? My advice would be, "Don't do it."

Here is a good letter from a Blair county reader:

"Dear Mr. Kester:—We have taken the Pennsylvania Farmer for 18 years, and will take it the balance of our lives, if it is published that long. I always read Neshaminy Garden notes first. Your advice sounds like a father's. We have a little farm of 18 acres and certainly do love it. We have a family of six children. We work hard, but have a good living. What more can you expect in this life? I am in the poultry and truck business."

"Now for some questions. I would like to get a seeder that will work. Is a a good one? Last season I borrowed a from my neighbor, but it would not drop the seeds unless the hopper was full of seeds. I am told that the will not drop the seeds thin enough. I want your advice. I have dropped seeds by hand for twenty years, but you waste seed that way, and the rows are not straight enough."

He then goes on to ask about tractors, but I will have to write him my answers to the rest of his questions.

There seems to be so little demand in this day and time for "fatherly advice" that this letter has an encouraging sound. It is also encouraging to know that a modern couple is willing and anxious to work hard for the sake of their numerous little ones, that they enjoy doing it, and that they are making a success of it. I certainly would feel churlish if I were not more than willing to give them the best in the shop in the way of advice.

Both makes of seeders named will do good work if in good order and properly set. We have the first one named. We do not depend entirely on the gauge in setting the seeder for the different kinds of vegetable seeds. Seeds vary in size with the variety. We always, after putting seed into the hopper, place the machine on a board, cement pavement, or other smooth clean place, and push it ahead to see how fast the seeds drop. The gauge may then be moved either way until the proper amount comes down in the turning. Always sow more seed than you actually want to grow,

otherwise you may have a thin stand owing to poor germination. Watch the germination figures on the package. We have found it pays to blow the dust out of beet seed before placing it in the hopper, as it tends to clog up and stop the free flow of the seed.

At this point it is worth while to mention the fact that exact sowing of beet seed so as to have just the number of plants wanted in a row is impossible. A single beet seed has several potential beet plants within it, as indicated by the number of nodules on it. Sometimes, depending on the vitality of the seed and the kind of season, all these will grow. At other times only one will germinate. For this reason you can't plant beet seed and have the plants exactly as you want them.

A New Jersey reader asks how my family tree is coming on, and says that I have been too mum concerning it of late. The tree is thriving. When I began writing these Neshaminy Garden notes the tree consisted of the main trunk and two branches. These two branches have doubled by marriage in that time, and each has two off-shoots. Thus, what was a family of four eight years ago has become a family of ten. The "off-shoots" consist of two boys in one case, and a girl and a boy in the other. I carry a very good photograph of the entire tree in my pocket, but it would spoil my reputation for modesty (if any) if I were to have it reproduced here. I hesitate even to state how unusually smart the younger generation is.

Friendly Talks

By Edgar L. Vincent

It takes more goodness of heart to receive a kindness graciously than it does to give one to somebody else.

Down through a gully at one side of our farm runs a little stream. For some time after it leaves the spring higher up on the hillside this bit of a creek goes along merrily. Birds sing in the branches of the trees above it. Smaller rivulets find their way into it. Cattle come down from the pasture and drink their fill from its crystal clear waters.

But all of a sudden this brook disappears entirely. Not a drop in the channel lower down. No cattle or sheep get a bit of water to quench their thirst. What has become of the creek? It has dropped through a hole in the bed of the channel and is hiding from the eyes of everybody. All the water it has received from other streams is swallowed up and we look for it in vain.

You will not need to go far to find men and women just like that. All the little good turns which are done them, every last one of the smiles and the kindnesses others bestow upon them, they take and swallow up just as the stream in the gully takes and never gives back.

It may be they do manage sometimes to say, "Thank you," but there does not seem to be much heart in it. The words fall from the lips in a mechanical sort of a way that carries little heartfelt love with it.

It is easy to get into the habit of taking without giving anything of love back again. All we have to do is to indulge our selfishness a bit more and the wicked thing will have us in its grip. But, oh, the joy of saying, "I do thank you!" graciously! That beats anything else we can ever know.

Two Weeks of June in February

By C. L. WHITE

HOME from the first Pennsylvania Farmer Florida-Cuba Tour! The bathing suit and summer clothes are packed away again. The old heavy overcoat is on duty once more. Stay-at-home friends smile and tell about the spring-like weather they had while we were in the balmy southland. But there is no trace of spring in the March lion's bitter breath as this is written.

As we walk along icy streets some of us try to warm ourselves with memories. A week ago we were watching tiny tots in sun suits, and adults in bathing rigs almost as scanty, splashing in the warm waters of the Florida beaches. Some of us joined them in the water or took a sunbath on the beach, or contented ourselves with the flowing warm air as we rode along in open cars enjoying the strange sights of a semi-tropical landscape.

This article is written by request, a request repeated several times by members of the Florida-Cuba Tour party: "You must publish articles about the trip in Pennsylvania Farmer so our neighbors back home who wouldn't come along will know what they missed."

So the purpose of this story is to bring vain regrets to some of the stay-at-homes. I fear I shall not be able to make them feel as bad as instructions demand, for my whole supply of double-strength adjectives isn't enough to tell about the sights, the experiences and the warm southern hospitality all of us enjoyed on this trip. As my Irish friend would put it, they would have to come along to know what they missed by staying home.

There were 131 of us aboard as our special train pulled out of the Union Station in Washington, D. C., on Tuesday afternoon, February 18th. That didn't include the several railroad officials of the Pennsylvania and the Seaboard lines and another member of the party who was taken ill but recovered and joined us later. Seventy of us had boarded two chartered cars in Harrisburg that morning and had dined as we rode to Washington to meet two more of our chartered cars there and a fifth coming down from Philadelphia. Five special Pullmans, a dining car and a combination baggage car and coach made the seven-car special which was our home for the next ten days.

Almost before we were settled in our Pullmans it was supper time. And as soon as the folks came out of the dining car we began to hear complaints about the food. They asked if that good-natured, curly headed dining car steward was trying to kill them with those great helpings of food too good to resist. We turned deaf ears to all such complaints, for "Bucky" Harris and I had resolved to have a good time on this trip. However, when we went into the diner a little later we started complaining ourselves. After one has had two or three other courses it just isn't right to give a person three meaty pieces of Southern-fried chicken and expect him not to overeat.

We were up for an early breakfast our first morning on the train. Top.—A glimpse of one of the Florida orange packing plants the Pennsylvania Farmer tourists visited. Center.—Typical undeveloped country near Sarasota, Florida. Hundreds of carloads of celery are shipped from farms nearby. Bottom.—"Down among the sugar cane." This happens to be near Ocala, Florida.

chapel of the model village he has built for retired ministers. And at lunch he told us about this development of over 100,000 acres where he is trying to help the right people get a good start on farms of their own.

Evening in Jacksonville meant movies for some of the crowd or exploring trips through the city. For others it meant mysterious business in the office car of our train and feverish activity with typewriter, stencils and a misbehaving mimeo-

graph machine. The result appeared next morning and at intervals thereafter a Tour Edition of Pennsylvania Farmer. Typographically and editorially it may not have been up to its parent; nevertheless the Tour Edition had its "points."

Next morning found us in Ocala where the Marion county business men unselfishly took us to see that marvel of nature, Silver Springs. Mr. Smith and the other officers of the Chamber of Commerce really wanted us to know about the opportunities their section offers to farmers. But they let us spend our time in the glass-bottomed boats and we saw little of the county's rich agricultural sections.

Three Million Quarts of Strawberries

Neonday lunch on the train; we saved time by eating as we traveled. In the early afternoon we were met at Plant City by another hospitable Chamber of Commerce delegation with leading citizens and officials in their fine cars to show us their town, their local agricultural school, the vast phosphate mines. Under Secretary Huff's guidance we saw phosphate rock in coarse sand and pebble form washed out of the earth by great streams of water under tremendous pressure. It made us think of a giant's fire hose or of placer gold mining in the old West.

Plant City had already shipped nearly three million quarts of strawberries this season, and they were still going north by the carload on the day of our visit, February 20. We saw them graded and loaded and our longing looks were so effective that a generous shipper, R. W. Burch Company, gave us two whole crates to be served with later meals.

Across the street was the Burch orange grading, packing and processing plant. There deft girls wrapped oranges in the familiar tissue paper as they came from the washing, polishing, grading and sizing machines. Nearby were great insulated rooms where all the fruit is heated and held at a certain temperature before shipping, to kill any possible Mediterranean fruit fly larva.

The U. S. Army was out in force to see that we took no oranges back onto the train with us. The dreaded pest has not been seen for months, but no chances are being taken. No one complained when the army men searched our baggage for fruit that might carry the fly. I had an apple which was confiscated and then returned on condition that I eat it at once. And the army hung around until I ate that apple and all the fruit flies it may have contained.

WHY NOT A TEST?

THOSE whose business is or may be adversely affected by the Agricultural Marketing Act are saying, with many voices, that said Act is unconstitutional. If they really think so why don't they test it? The Federal Farm Board has gone to the limit of its legal power by establishing a grain stabilization corporation which is actively in operation. No reason now exists for the grain trade to postpone a legal test. Either that or less vocalism about unconstitutionality is in order.

THE WORLD'S FLOCK

IN presenting its bulletin on the world's wool situation the Bureau of Agricultural Economics wisely refrains from price forecasting—a policy that should prevail in all cases. The Bureau estimates the heavy production of 1929 at 2,687 million pounds, about nine million pounds above 1928, and expects production in 1930 to be "not greatly different" from last year. The world's flock, or the total for nineteen countries reporting, last summer was 267,215,000 sheep, an increase of about 10,000,000 over the period 1909-13.

FROM LIFE

MANY years ago a representative of this paper was impressed by the pure-bred hogs produced by a certain young breeder. He persuaded the breeder to try a small advertisement, being certain that the hogs would satisfy customers. They did, and for over forty years that breeder advertised constantly and exclusively in this paper. He told us once that he could not interest his neighbors in his hogs until they saw him shipping them to distant buyers, but he enjoyed a good nearby trade when they realized that he could sell away from home.

NOT SPECULATING?

THE Federal Farm Board issued an official statement last week which said: "The Stabilization Corporation is being accused of speculating in the grain market. There is no foundation in fact for such statement. The Stabilization Corporation is prepared and expects to take delivery of all grain purchased on futures contracts and merchandise it as conditions will permit." What is speculation if this is not? Buying, holding and selling or "merchandising" is of necessity speculation, no matter whether cash wheat or future contracts are bought, carried and

sold. The Federal Farm Board has proved conclusively that it does not know what the future of wheat and cotton markets will be, and without such knowledge it must speculate whenever it buys either of them with expectation of later selling.

CONSERVATIONISTS

LAST week was Conservation Week in Ohio by proclamation of Governor Cooper, who is an ardent advocate of the cause and has secured legislation favorable thereto. A conservation congress was held at Columbus composed of representatives of all organizations and interests concerned. Here the preeminence of Pennsylvania in conservation was recognized by speakers from Ohio and several other states, and by the presence of several Pennsylvanians on the program. We were among these, and we tried to show that farmers are more interested in true conservation than any other class, also more given to the practice of it. For example we cited the 40,000,000 forest trees planted by the farmers of Pennsylvania during the latest five-year period and challenged any other class to show anything equal to it. In Ohio's conservation plans and personnel agriculture is well represented as it should be everywhere.

NOT WANTED

A FEW hundred yards from this office a grading and building operation is in progress. Perhaps twenty or thirty men are employed there on days when the weather is temperate enough to permit out-door work. On one side of the entrance gate is a large sign which reads: "No Help Wanted." On the other side of the entrance a few feet away is another sign. It reiterates: "No Help Wanted."

Volumes written about the comparative economic security of farmers couldn't be as expressive as those signs and the brutal directness of their message to the city's job-hunting bricklayers, carpenters, stone masons, plumbers, electricians, steam shovel operators, truck drivers and that great unclassified army of mere "laborers."

A PLACE FOR DUALITY

SAM HIGGINBOTTOM sends us his magazine, the Allahabad Farmer, which always contains something of interest. In the latest number William Smith, whose title is Imperial Dairy Expert, discusses India's cattle problem. That country has 45,793,625 adult bullocks and 37,885,686 cows. He counts 90 per cent of the bullocks as actually required for the work of cultivation and their average life as nine years, concluding from this that only 4,579,362 bullocks need be raised every year. Then he says, "To do this only 1,400,000 cows are necessary"—wherein we can't quite follow him; but then we can't usually follow even ordinary experts, let alone imperial ones. We take it that the last-named cow figures are erroneous, for he says that "India carries some 24,000,000 cows not required for bullock production". What is to be done with these millions of cows? Mr. Smith thinks they ought to be milk producers, for the people of India neither work cows nor eat them. The cattle problem in India therefore is to get cows that will produce good work oxen and enough milk to make their keeping profitable. Here is a big field for a dual-purpose cow, and no doubt even Mr. Lighty would approve the dual principle in such a territory.

DEER REGULATORS

IN an effort to protect their crops and trees last year the farmers of Pennsylvania killed 1,193 deer. Such killing is not condemned by the Board of Game Commissioners, but farmers are asked to kill does rather than bucks whenever it is possible to discriminate among

marauding deer. That is a reasonable request. Our correspondence indicates less damage by deer in 1929 than for several years previous, and that is one of the wholesome effects of an open season for does in 1928. Farmers should insist on such a season every few years or whenever the deer become too numerous and destructive. Sportsmen, with the best kill of bucks on record following an open season for does, are learning that the way to have more deer is to have less. In other words fewer deer with proper balance of sexes will yield more and finer trophies than an unlimited number of sacred does and the perennial killing of bucks. Experience has proved that, we hope, to the satisfaction of all concerned.

LOWER PRICE LEVELS

IN discussing declining prices for wheat, cotton, wool, lambs, hides or other agricultural products in which we are directly concerned we are likely to overlook the same tendency in other commodities. But that tendency is manifest in a long list of things aside from the products of our country's farms. We might mention, for example, silver, coffee, sugar, raw silk and its competitor rayon, petroleum and its products, rubber, most of the metals and many of the staple chemicals, all selling at lower prices. In a few cases, such as rubber, coffee and raw silk, this tendency has been in the face of attempts to stabilize prices by artificial means or by government assistance. For prices are not respecters of government, no matter which way they are going.

What is the reason for concurrent declines in so many important commodities? That is a question to which no concise general answer may be given. In some cases the price of one commodity naturally affects the prices of others of the same class. Such relations exist among the different grains, among the metals, among the textile materials, and so on. Or the price of one class of products may affect the demand for another class, as for instance the effect of high or low prices for wheat and cotton on the market for fertilizer chemicals. The breadth of the current movement toward lower price levels suggests something more than such influences as these. Probably it is very largely the effect of heavy production stimulated by past necessity and attractive prices. Certainly this is true in some cases, and in such cases the present tendency is natural and inevitable, not to be stopped by any artificial interference.

Men may discuss at length deflation, normal prices, balanced production, increasing consumption, orderly marketing or what not, but they cannot escape the ultimate consequences of producing too much of anything.

A BUSINESS ERROR

WE'D like to see a better wheat market for the price of that grain means much to agriculture. We'd like to see every organization and every individual able to sell every bushel at a good price. But facts must be recognized and one of them is that the Canadian pool and all other organizations and all individuals holding wheat for higher prices have made a serious business mistake. Individuals are at liberty to make such mistakes, for they are dealing with their own property and responsible for their own losses; but the officers of cooperative organizations are not in that position, so they cannot escape the censure of their members when they indulge in speculation that goes amiss. The officers of the Canadian wheat pool are now blaming each other for the error; and the provincial governments have to guarantee the pool's bank loans to prevent its collapse and ensuing market demoralization. Possibly this experience, however costly it may be now, will prove valuable in the end. For it may help to show marketing organizations that their business is to market rather than to speculate by holding or in any other way.

THE enjoyable banquet of Burlington county dairymen held at Mr. Thompson last Thursday evening brought to the attention of the dairy industry the importance of that industry to that county. Over 250 men and their wives attended this banquet which for the past six years has been held under the auspices of the Burlington County Herd Improvement Association. Only a successful association could bring together an enthusiastic group of this size for an evening of entertainment.

Even Amos 'n Andy were present. County Agent Thompson, knowing that no farmer could leave home until he had first learned the latest troubles of Amos 'n Andy, arranged with a local radio dealer to have this hour broadcast during the banquet.

On speaking of the outlook for the dairy industry, Dr. W. J. Spillman of the U. S. Department of Agriculture brought out some interesting facts concerning the butter now in storage and the weakening milk market. That the amount of butter in storage is due to unemployment throughout the country and less butter being consumed rather than an overproduction is the belief of Dr. Spillman.

He considered the present situation temporary, but pointed out some things which dairymen must do to remedy this. High prices for cows during recent years has brought about an increase in the number of calves being raised by dairymen. It is estimated that there will be an increase of three per cent in the number of milking cows this year unless herds are culled more closely this year and many of the boarders weeded out. Dr. Spillman urged all dairymen to carefully consider the elimination of the unprofitable cows at this time. Dr. Spillman expects the Middle West owners of dual-purpose cattle to relieve the situation to some extent. These farmers can go into and out of the dairy business over night," he said. When prices for dairy products are high they milk the cows, but as soon as prices go down they untie the calves and turn that milk into fuel.

"This has happened in past years and we may expect the same thing to happen this year," Dr. Spillman told the Burlington county group.

Judge H. B. Wells, of Bordentown, in his address on the philosophy of life not only brought smiles to the faces of all, but left many thoughts for them to carry home.

REFORESTATION of marginal farm land has been a widely adopted program of our eastern states for many years, but farmers have been rather slow in accepting the offers made by the states to furnish seedling trees and other facilities. Just recently Alexander Legge, chairman of the Federal Farm Board, said that if every American farmer were to devote five per cent of his present acreage to restoration of the woodlot he would have gone a long way toward meeting the problem of over-production.

Most people think of a reforestation program along the lines of large areas commonly accepted in terms of future timber supply, but there is another kind of reforestation that is equally important—in fact, more important to agriculture—that is the reforestation of the so-called "woodlot," said Mr. Legge.

All the farmers in Maryland would plant five per cent of their poorest tillable land in trees it would amount to approximately 400,000 acres or about the combined acreage of Kent and Howard counties, was shown by F. B. Trenk, specialist in forestry for the University of Maryland. The average cost of planting an acre of land in trees is about \$9.50, which for the average farm in Maryland over a three year period, would amount to \$28.50 per year.

Judging from these figures many farmers can probably give this reforestation program serious consideration. We would be following an example of many older nations which have met similar problems in this way.

FARMERS all over the country are receiving questionnaires to be used in taking the 1930 census. Those who are not already dizzy from trying to answer the 232 questions correctly probably will be in that condition when the official enumerators visit them in April. Some of us who keep farm records may have to give up all thoughts

New Jersey Farm Comment

By G. W. HARRIS

of spring planting and take that time to figure out what we have been doing in the past.

These schedules are to be filled out and kept until the enumerator visits each farm. A report is required of every operator of a farm in the United States, a farm, for the census purposes, being any and all the land farmed by any one person, either by his own labor alone or with the assistance of members of his household, or hired employees. The land operated by a partnership is likewise considered a farm. A "farm" may consist of a single tract of land, or a number of separate tracts, and the several tracts may be held under different tenures, as when one tract is owned by the farmer and another rented by him.

When a landowner has one or more tenants, croppers, renters, or managers, the land operated by each is considered a farm. Thus, on a plantation

Son Poultry Farm at Little Falls holds fourth place with 1,123 eggs, only 24 behind the leading Pine Hill Poultry Farm pen.

Five New Jersey entries, led by the Fox and Son Leghorns, have passed the 1,000 mark. Barred Rocks owned by Spartan Rock Farm, Nutley, rank second with 1,052 and also lead all other entries of the breed. Two Leghorn flocks owned by Darfelt's Poultry Farm, Peapack, and United Poultry Farm, Toms River, are tied for third place in New Jersey with 1,039 each. Fourth place goes to Leghorns from the Quality Poultry Farm, Montville. Their score is 1,007 eggs for the 21 weeks.

FOX and Son Poultry Farm, Little Falls, N. J., is leading the Hunterdon County Egg-Laying Contest with a score of 979 eggs for 21 weeks. This is a margin of 31 eggs over the second place pen, also Leghorns, owned by Jerseyland Farm, Point Pleasant. Third place is held by a North Carolina entry of the same breed.

All breed divisions are being led by New Jersey flocks. In addition to the Fox and Son entry in the Leghorn class, Valley Brook Farm, Peapack, and Kerr Chickeries, Inc., Frenchtown, are ahead of all others in the Barred Rock and Rhode Island classes with 815 and 879 eggs. The miscellaneous group is headed by Wyandottes owned by Lauderdale Brothers, Lambertville, with 899 eggs.

QUARANTINE MODIFIED

MODIFICATIONS of the Japanese beetle quarantine with additions to the former territory have been announced to fruit and vegetable growers, shippers and dealers. According to the report sent out to the produce trade in general, Arthur M. Hyde, Secretary of Agriculture, has determined that it is necessary to quarantine sections of Massachusetts, New York, Pennsylvania, Delaware, Maryland and Virginia. The new quarantine regulations include the entire states of New Jersey and Connecticut as well as the District of Columbia.

The areas included in the quarantine with respect to certain states and parts of other states is as follows: Connecticut.—The entire state.

Delaware.—Counties of New Castle and Kent; and the hundreds of Broad Creek, Cedar Creek, Gumero, Little Creek, Nanticoke, North West Branch, and Seaford, in Sussex county.

District of Columbia.—The entire District. Maryland.—Counties of Anne Arundel, Baltimore, Caroline, Carroll, Cecil, Dorchester, Frederick, Harford, Howard, Kent, Montgomery, Prince Georges, Queen Annes, Talbot, Washington and Wicomico; and the city of Baltimore.

Massachusetts.—County of Hampden. New Jersey.—The entire state.

New York.—Counties of Dutchess, Nassau, Orange, Putnam, Rockland, Suffolk, Westchester; New York City, including the boroughs of the Bronx, Brooklyn, Manhattan, Richmond and Queens; towns of Binghamton, Conklin, Dickinson, Kirkwood, Union, Vestal, Binghamton, Broome county, towns of Esopus, Lloyd, Marlborough and Ulster, and the city of Kingston in Ulster county.

Pennsylvania.—Counties of Adams, Berks, Bradford, Bucks, Carbon, Chester, Columbia, Cumberland, Dauphin, Delaware, Franklin, Juniata, Lackawanna, Lancaster, Lebanon, Lehigh, Luzerne, Mifflin, Monroe, Montgomery, Montour, Northampton, Northumberland, Perry, Philadelphia, Schuylkill, Snyder, Sullivan, Susquehanna, Union, Wyoming and York; the townships of Armstrong, Clinton, Eldred, Fairfield, Franklin, Jordan, Loyalsock, Mill Creek, Moreland, Muncy, Muncy Creek, Old Lycoming, Penn, Shrewsbury, Upper Fairfield and Wolf, and the city of Williamsport in Lycoming county.

Virginia.—Counties of Arlington and Fairfax and the city of Alexandria.

In drafting the quarantine regulations for 1930 Secretary Hyde has designated three districts or territories, which are known as the regulated area, the generally infested area and the lightly infested area.

These early morning programs make a hit with the hired man

the land operated by each cropper or tenant should be reported as a separate farm, and the land operated by the owner or manager by means of wage hands should likewise be reported as a separate farm.

No tract of land under three acres is considered a farm unless its products in 1929 were valued at \$250 or more.

IN response to the request of the Federal Farm Board to 12 northeastern states for information on the marketing needs of each state, New Jersey plans to begin a survey this spring to determine the status of farmers' cooperative organizations in the state. An allotment of \$2,100 has been made to New Jersey by the Federal Farm Board for this purpose.

Such information as will be secured could profitably be used by groups of farmers in the state who are dissatisfied with their present marketing system and are planning changes.

APEN of Rhode Island Reds owned by the Scott Poultry Farm, Groton, Mass., led the Vineland Egg-Laying Contest at the end of its twenty-first week. This flock gained 11 eggs on the second place Pinecrest Orchards Rhode Island Red birds from the same place and now leads by 16 eggs. The totals of these two flocks are 1,209 and 1,193 eggs respectively.

The leader among New Jersey-owned pens are Rhode Island Reds from the Woodview Poultry Farm, Mount Holly, which have laid 1,101 eggs to take fifth place among all competitors. Following them are Rhode Island Reds owned by Louis D. Schable, Shiloh, with 1,085 eggs.

During the past nine weeks the Vineland Contest has shown a production of 65 per cent or more.

For Future Agriculture in Keystone State

By ALLAN L. BAKER

NE of the first problems confronting our young people on the farms is who shall stay and who shall leave the farm. Only the individual can answer that problem. What assistance is available in helping him to make that decision? May it not be that club work can help him make it?

One way of determining aptitudes and attitudes toward farming and farm life is for the individual to begin, in a small way, to try out several types of farm activity to see which ones appeal to him and in which branches he may possess some special ability. Participation in livestock, fruit and crops clubs will enable the boy to feel his way and to eliminate those branches for which he may not be adapted.

In this connection, it might be interesting to cite the case of a young man in Beaver county who, as a youth, joined a community potato club largely because his friends and chums did so and not because he was particularly interested in potatoes. Nor was he interested in pursuing farming as a career; in fact, he had definitely made up his mind that he did not want to stay on the farm, but intended to enter the mills which flourish in the Beaver Valley.

A second year of potato club work followed; the thing actually got to be interesting. Some seed potatoes yielded 40 per cent more than others, even though conditions as to soil, fertilization and cultivation remained the same. "Why was this?" the young man asked himself. Paying attention to the demonstration he learned, gradually, the underlying principles of profitable potato production. "If these principles apply to potatoes, why not to other crops, to fruits, to livestock?"

And so the young man developed, growing each year in perception and understanding. A prize scholarship enabled him to attend the eight weeks short course at the Pennsylvania State College. Here the same progress was continued; his decision as to his life work was reversed. Today that young man is married, is living on a Beaver county farm, thoroughly enthusiastic about his future prospects and apparently well on his way to becoming one of the county's leading farmers of the next generation.

A prominent educator has defined education as "A process of directing experience in such fashion that certain desired changes in disposition, knowledge or conduct shall result." Club work, using the project method of teaching, is based on just that philosophy, that "experience is the best teacher."

The club member learns while he earns, he has a direct and personal experience in his chosen line of work, a guided or directed experience with the assistance of local club leader, county agent, and college extension specialists to aid him. His learning is active, personal and motivated by interest in the project undertaken; positive results are assured in a large majority of cases of participation.

Fortunate we are, too, in the close association of farm business and home. Since the industrial revolution, when the steam engine took industry out of the home, farming remains the one large industry where home and business are closely associated. Shop workers, factory hands, store employees, the merchant and salesman all leave their homes to pursue the daily tasks. Children growing up in those homes do not have the advantage of daily contact with father's business as in the days gone by.

Social Adjustments in Progress

The business, trade or profession must be learned outside the home and our urban schools have, to a large extent, taken up the burden of providing vocational training. School print shops, manual training, machine shops, home economics courses, handicraft, etc., are the answer of the school to industrial revolution. Not so with the farm youth. Here the old association remains and rural parents have an opportunity to guide, or di-

rect, the experience, education and training of their children to follow in their footsteps as no other group of people have.

Not only have there been economic adjustments; social adjustments have been and still are being made. Gone are the days of primary neighborhood contacts, of neighbor helping neighbor, of log rollings, barn raisings, husking bees, quilting bees, and the like. Social affairs in many communities are not limited to the small neighborhood. Machinery, better transportation and marvelous communication facilities have broken down the barriers.

More and more, farms are economic units in themselves. Contacts made by the individual are secondary, or remote, not primary and nearby. Business, banking, social contacts, church memberships, are centered often in villages, towns, or cities which were a day's journey removed a generation ago.

New Influences in Life

No longer do the majority of farmers dicker with the local dealer over the price of milk. Mr. Farmer belongs to a cooperative dairymen's association, with offices perhaps 150 miles away, which has representatives meeting with those of distributors and consumers, the group determining the price after considering all factors.

Does Mr. Farmer understand his relation to this secondary, or remote, group? Does he understand how he can make his voice felt in determining its

Progressive Union county parents are giving their youngsters the benefit of a "directed experience" in dairy club work. Included also are prospects for founding a pure-bred herd and building an income.

policies? Does he understand how the policies determined by the directors filter back through the organization and affect his attitudes and business? The efforts continually being put forth by such organizations to maintain the morale of their membership are evidence that his understanding is not too clear.

The daily urban newspaper in the farm home with its nation-wide and unified press dispatches is a powerful secondary influence in molding the farmer's opinions and attitudes. A newspaper correspondent talking over the radio from London, three thousand miles away, molds our attitudes on naval limitation and world political affairs.

Some weeks ago, at the State Farm Products Show, the writer was interested in listening to a group of club members whistling as they combed and curled their baby beeves for the show. What were they whistling, "Old Black Joe," "My Old Kentucky Home," or "Comin' Through the Rye?" Instead, I recognized "Tip Toe Through the Tulips," "If I Had a Motion Picture of You," and others of the type. Where did they learn them, in the little red school house? That influence comes from the "talkies" in a town perhaps fifteen miles from their homes, or from a New York radio studio 180 miles away.

Our young people of today need training and ex-

Club members with local leader and county agent "learn to work and play together... understand parliamentary procedure and the conduct of a business organization."

perience which will enable them to adjust themselves comfortably to this modern social situation as it confronts the farmer. Club members learn to work and play together, to conduct their own business, they understand parliamentary procedure and the conduct of organization business. Through an understanding of the club organization, as it reaches down from the United States Department of Agriculture, The Pennsylvania State College, the county agent and county extension association, through the local community leader, to them, they come into a fundamental understanding of the workings of these secondary influences and their part in the greater whole.

On the sociability side, club work is an asset to a community. Commercial recreation and amusement has made inroads upon our rural social situation. How much we can do about it, how much we should do about it, we cannot tell.

Two things the young person may need. One is to have provided sane, sensible, self-created recreation and entertainment in his younger years, free from the baneful influence of certain types of commercialized amusement. The other is to have developed within the individual an appreciation of the right types of recreation and amusement so that as he grows older his attitude and ability to choose will lead him aright in the pursuit of his leisure-time activities.

One of the stumbling blocks for the fellow who decides to remain on the farm is the acquisition of sufficient capital to get a satisfactory start in his chosen field. First, to build an income, second to acquire capital therefrom, and third, ability to manage that capital that further and sufficient income for the establishment of farm, home and family may result. Club work gives the farm boy an economic experience in a small way on which he can build his future economic independence.

We have in mind two brothers, farmer potato club members in Butler county, who are now in business for themselves and annually grow 30 acres of potatoes. Their experience and training was started in a small way with one sack of disease-free seed. Other examples of the building of pure-bred livestock herds, etc., are continually being given in the columns of The Pennsylvania Farmer, so we need not dwell at length on that angle.

Agriculture like any other industry does not stand still. Progress has been and is being made. We know that our potato acreage is decreasing but that our net production has increased. Fewer cows are producing more milk, fewer trees more apples. The farmer of tomorrow must be more efficient than the one of today if he is to survive in the competition.

Young farmers like Gerald Gummo, of Clinton county, with his ton litter of Chester White pigs, or Clay Erdley, Union county, with his champion Holstein cow producing 10,387 pounds of milk and 391.3 pounds of fat in nine months have an ideal implanted in their minds which will be a standard for future conduct.

These factors of improving livestock and crops of increased efficiency, of higher ideals, of training the young people to meet the situations of tomorrow are not confined to any one community, one county, or one state. They are universal. In Pennsylvania alone, there are some 200,000 boys and girls of club age, 10 to 20 years of age, who are facing the problems that have been enumerated

"Go ahead and try your lunch-counter plan," he said. "I reckon you'll have one good customer no matter what you do, and that's Jack Rose."

Toots had a suspicion that Mrs. Ham would bring more good-will than that, and this proved to be the case. People liked her and admired her for her plucky efforts to support herself and her inefficient, rather silly sister. Miss Orianda declared that the family pride was humbled to the dust by Nesta's public display of herself as a shop-keeper's clerk, but she consented to make the doughnuts to be added to the cups of coffee.

"You must never let on to anybody about this," said Mrs. Ham to Toots. "Never even let Orianda know that you know. If you do she will stop making them." Mrs. Ham smiled and raised her eyebrows in a whimsical way.

Toots promised and Miss Orianda, satisfied with the kind of concealment practiced by the ostrich that hides its head in the sand, contrived to send the doughnuts by the hand of a darkey, sworn to secrecy. The urn amused the Carburyites, but the odor of the coffee, which was the best Toots could buy, was not a thing to be sneezed at by southern noses, and the doughnuts were delicious. The innovation became a popular institution almost immediately.

During his spare moments Toots worked with Daddy. Right in the middle of their labors on the all answers to the advertisements began to come in. Toots had set terms that Daddy had thought were too high, but none of the applicants found fault with them. The one thing they wanted to be sure of was a guarantee of good sport, and this the partners felt they could honestly give.

Toots had noticed the peculiar "blinds" used by some of the gunners of the fleet. The ordinary method was to shoot from a stand on some projecting point of shore, or bit of marsh, but the oystermen stuck small cedar trees on a naked flat, in the form of a hollow rectangle into which they ran their low punts, and thus got good shooting on the ebb tide, when the average shore of pond-hole stand was almost useless. He and Daddy installed a number of these and then felt they were ready for business.

They judged it expedient, however, to take not more than three boarders at a time. Daddy could attend to that number himself. With the money coming in from the boarders and Toots' salary they could well afford to hire a carpenter to work on the ell. Toots thought it best, and Daddy agreed with him, that he should continue on at the store, turning over what he earned into the improvements and outfit until the Bullseye was in proper shape and going strong enough to provide a reasonably sure living for them all.

To do this the Bullseye must be prepared to meet the fall and winter gunning custom, and the spring and summer patronage of fishermen. The two lines were not so far apart as to demand radical changes in methods of operation, but there were differences that meant additional expenses and special planning.

THE way Mrs. Ham took hold at the store made Toots' duties there less heavy than he expected. But after all he was not surprised. Why shouldn't an active, intelligent woman make a success at such work. Mrs. Ham had, as she said, a real knack for figures. Even Jepson, who kept his eye on the business much more closely than he had in Tiger's time, half grudgingly admitted he couldn't have got a better book-keeper. But it was her agreeable personality and her keen interest in every detail that made her especially valuable. She studied every angle of the trade, from purchasing goods from the wholesalers to selling them across the counter.

Toots, far from being jealous, was delighted at her ability, which promised satisfactorily to settle a crisis that he foresaw was bound to come soon. The few boarders who had come to the Bullseye found everything up to their expectations. The sport was excellent, the house homely and attractive, and Nancy's cooking went to the right spot. And Daddy, quaint and capable, made a hit with them. Some of them stayed longer than they had originally intended, and all declared they would come again and heartily recommend it to their friends. But this sort of advertising, pleasant as it was, was hardly needed. The ads. in the sporting papers were already bringing in more applications than they could handle. The question was arising whether they could afford to turn down the applicants for the sake of Toots' work at the store.

Daddy and Nancy both voted in the negative. Toots held out against them for some time, solely out of consideration for Jepson, but he was sure that Mrs. Ham could fill his place perfectly. He talked it over with her, and though she was unselfish enough to hope he would stay on, she thought she could manage the store. The larger salary would, of course, mean a great deal to her.

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Sloeman Company

But she urged him not to resign until he felt his own affairs absolutely demanded it.

Toots expected a tough quarter-of-an-hour with Jepson, when the time came for a show-down. He had it. Jepson was indignant at first, but his indignation was really a kind of dying throes of his conservatism. He couldn't and perhaps didn't want to believe that any woman could run any store of his.

Toots suggested a three-cornered discussion with Mrs. Ham, but Jepson was afraid that this would look like committing himself.

"Well, why don't you go to the store and see for yourself how things are running?" said Toots. "Ask her any questions you think of."

Jepson agreed to this and for several days he probed about the store with an innocent and casual air that deceived nobody. Mrs. Ham was quite untroubled by his presence. She knew that she knew the business. Finally, when they happened to be alone, she turned on him with a smile.

"Now Mr. Jepson, please give me an examination," she said.

Jepson yielded. He asked every trade question he could think of, and then pushed back his spectacles with a gesture of surrender. One at least of his old-fashioned prejudices was scotched.

"You win, Mrs. Ham," he acknowledged. "But where you're going to get an assistant from the Lord only knows."

Jepson was unduly pessimistic. No one had liked to work for Captain Tiger, but with attractive Mrs. Ham in charge the atmosphere of the store was entirely different. Moreover, Jepson, hiring direct, paid better wages than Tiger. A clean, enterprising young fellow, a nephew of the lazy Joe Hoskins, proved eager to take the job.

At last Toots was working for himself, was in that desirable position where he was his own boss. And yet he was not wholly satisfied. He tried not to let himself acknowledge it, but the thought would intrude that, supposing the Bullseye kept on being as profitable a venture as it promised, was he going to be content to settle down as a sports-

man's guide, or even as a hotel proprietor, employer of hired guides?

In other words, was money all that he was after? For success in Carbury meant money only. It wasn't a small thing to mean, of course. There were times when Toots, thinking of the past, was dazzled and exhilarated by the idea of a comfortable future; nevertheless his old longings would not down.

Good food, good clothes, freedom from anxiety as to where his next job was to come from, all these were mighty fine, but what about that other side of him, the side that wanted an education, that was more concerned with filling the pockets of his mind than the pockets of his clothes? Toots didn't know exactly what the trouble with him was, only his mind had a way of feeling empty.

Reading partially satisfied the feeling, but at the same time aggravated it. Other people's cleverness was a delight to him, but it did emphasize how little, how very little, he himself knew.

Toots was not the kind to talk about himself, or let his thoughts interfere with any work in hand. In fact he tried to drive such thoughts away by working extra hard, and to a certain extent he succeeded. Often he was really happy, especially when, in between boarders, he had time to devote to his shells. Whenever he could, after a hard blow, he went across to the outer bar to see if any specimens had been washed up, such as the calliostomas, of which he found two on a lucky trip; the white scalas with their smooth, elevated ribs; the chestnut-barred natica, whose flaring aperture is lined with purple, and other more common species.

At the extreme low tides, which fell twice every month, he hunted over the flats for species that liked quiet, shoal waters and fed on algae and eelgrass. Daddy and Nancy considered him a little "gone" on the subject, but they had ceased to tease him about it. Toots was certainly entitled to his harmless hobby. For the first time in their lives they were feeling prosperous and they believed they owed it all to him.

THE cottage on the lagoon shore had rather lost its right to that title. The new rooms in the ell, each planned to hold two boarders, had been supplemented by the old kitchen, transformed into a bedroom, and a new kitchen with up-to-date appliances, built out from the north side of the dining-room. Moreover a small dormitory bungalow had been erected close to the shore.

Toots was at the bottom of this expansion, but he had not insisted on it until he had ascertained the boarders' views as to future prospects. They were all optimistic; not merely because of the excellent sport, but also for the reason that Daddy, Nancy and Toots were as agreeable as they were efficient, and because the cottage with its living thatch and masses of shrubbery, and the wide expanse of islet-dotted water at its gate, were unusual and picturesque.

Toots' prices were not low, and most of the boarders were men of ample means. They were familiar with pretentious, over-crowded hotels and heartily sick of them. The simplicity and snug coziness of the Bullseye was a welcome change. The fare was like the home fare they had once been used to, and to which they liked to look back fondly. As a matter of fact it was really better, for Toots had never forgotten the Colonel's saying that "the way to a boarder's purse is through his stomach." Nancy had made a wry face at this aphorism, but she did not forget it either. The team-work of the three was one of the big reasons for the Bullseye's success.

With very few exceptions Toots found the boarders as interesting in their several ways as his books. He did not realize that his own personality had a good deal to do with it, that the men saw something in him that appealed to them and pre-disposed them to friendliness. Occasionally they were unapproachable and arrogant, men whose money and the power it gave them had turned them into selfish egotists such, for example, as Chester A. Welby of New York.

Welby was a millionaire toy manufacturer. He should have been the Santa Claus type, big-hearted, jovial, ruddy and kindly of eye, but he wasn't. His cold aggressiveness of manner never left him even when with his equals, and Toots and Daddy he treated like inferior persons who had to be kept in their humble places. He was a keen hunter and an exceptionally good shot, but never satisfied with his bag. On his first day on the water, looking at a distant raft of brand, he remarked: "I'd like to get that bunch lined up and blow the heads off every one of them."

From that moment Toots conceived a strong dislike for Mr. Chester Welby. It fell to him, however, to act as Welby's guide, for Daddy was already engaged with two other boarders. Toots had no intention of quarreling with his bread and butter. (To be continued.)

The Cheerful Plowman

EXTRA DOLLARS!

WHEN there's a chance to make a dime, or twenty pennies at a time, a dollar and a half, an extra ditty here and there, that money's just as good, I swear, as coin from pig or calf. Some farmers are too proud, I feel, so extra dollars don't appeal picked up just here and yon, they will not grab the thirty pence that comes from yonder, aft and hence, the mites they happen on.

Not so with me. I do not wait, nor blush with shame nor hesitate when I can earn a sou, provided if the way is fair, the money's just as good, I swear, it's money through and through. For instance, in the winter time I do not think it is a crime to do some trapping then, so wife and I slip out at night and set some traps and set them right around a cave or den, and if we catch a thing with fur that means some cash for me and her, a dollar, two or three, and by the powers, that coin, I learn, when it's invested in its turn for hats for her or me goes just as far as coin that comes from wheat, or oats, or spelt, or plums, or barley, hens, or rye. It buys of merchandise the same as other dollars in the game, it surely does, and why?

If I were proud in silly way I would not utilize a day in catching fish and frogs; I'd say that money made like that is not real money smooth and fat, like money got for hogs. I'd say, "I hate such petty pence, a man is small and has no sense who earns such dollar bills; the only cash that's worth the name is taken in a bigger game, it's won from fields and hills."

County Libraries Help Schools

By GERTRUDE S. STEWART

UNCLE SAM recently completed a survey of library resources in two California counties. Their research compares for one year two counties similar in topography, population, assessed valuation, number of school districts and total amounts expended for public schools. One had county library service—the other did not.

In the county with library service, the schools had not only good classroom libraries, but many supplementary textbooks, phonograph records, stereographs, magazines for the children, professional magazines for teachers, and many circulating books for recreational reading. Here they found the children well advanced in their work and rapidly acquiring the "reading habit."

Now let us read what they discovered in the county where each school purchases its own collection of library material. In these schools are a vast accumulation of unused supplementary texts, old books of reference, and many books not at all suited to the schools where they filled the shelves. These same books, however, might have value if circulated to other elementary schools, high schools, or communities.

How about money spent? The county library spent \$3,560 and gave real service. The county without library service spent \$3,243 during this one year, and the benefits were uncertain and haphazard. This set of schools had but a few new books per school, and they will soon be sleeping on the shelves beside the other dead books already buried there.

Where the county library is in charge, each school receives many sets of books, magazines and records, for a constant interchange is established, and no volumes have a chance to get dusty.

California is very alert on this subject, and has forty-six county libraries in charge of school supplies. Only twelve more counties to fall in line. In the East we find New Jersey boasting ten county libraries out of its twenty-one counties.

A new one, Somerset county, voted on this subject in November, and the vote carried, seven to one. Bills are now pending before the legislatures of New York and Virginia providing generous state grants for maintenance of county libraries. Mr. W. F. Seward, of New York, says, "The library is the noblest exponent of the American spirit.... It means beauty, happiness, intelligence and well being, the prosperity and thrift of its community."

Have you a county library? If not, arouse ye! Society of Farm Women, Home Bureaus, Granges, Parent-Teacher Associations, Women's Clubs! Ye, and all the other county cliques! Get ye together, and start the library truck in your community!

There is an attractive and interesting booklet published by N. Y. State College of Agriculture which might help you in starting enthusiasm. It is called "The Library of the Open Road." Free for the asking. Drop a card to Cornell University, Ithaca, N. Y. Ask for Bulletin No. 188. A community without a library is a community whose soul is asleep.

A Feast of Catalogs

DEAR Sadie:—Are you enjoying the beautiful spring seed catalogs? I have just been feasting my eyes on the colorful flowers and vegetables, and my order for early garden seeds has already gone forth. In it are several old favorites no one mistakes in buying.

It would be hard to beat the Oxheart carrot, Macomber rutabaga, Pencil Pod black wax bean and the Scotia pole bean. These we have used for several seasons and thought you might like to try them in your new garden this year.

The Oxheart carrot grows quickly, is always sweet and tender. It has no core and no tough fibers. The small tender ones can perfectly, and those that grow to mature size may be stored in the cellar for winter.

The Macomber rutabaga is the most delicious of all the turnip family. They are tasty as soon as of a size to eat. Those that are left to grow large, store well in autumn and keep until late spring. They are crisp and tender all winter long. We find this white rutabaga very sweet and mild. It is sometimes called the Swede or Russian turnip.

Stringless wax beans are a delight, and the Pencil Pod black wax heads the list. The pods

are long, straight and round, clear yellow very brittle and really stringless. They mature early and are vigorous and productive.

As soon as the early bush beans are gone, the Scotia pole bean is in bearing, and if picked clean, will continue to feed you through August and even September. A few hills supply a family, but do plant enough that you can have a case or two of jars "put up" for the winter. They are more rich and tender than any beans we have ever eaten. The pods are light green and entirely stringless.

I hope you will like these good things, too. As ever, Sis.

The Question Box

CAN you help me with my problem? Our boy is nearing the entrance to high school, and when we look over some of the graduates of this school, we are quite discouraged. If we send him through, will he think more of a white collar than of the honest toil on the farm? Mrs. D. L. W.

"As the twig is bent, so is the tree inclined." Many of our country's really great men grew up on the farm. No one can promise what any boy will become. If his background has been of straightforward character building, he is not liable to grow lazy just because he has that splendid opportunity of going to high school.

Many high schools today offer a course in agriculture, where boys with the farm bent may have training, and this is ideal for the country lad who wants to farm.

Boys who have no definite ideal of work in mind

When preparing broccoli, use the center stalks with flower heads attached. Cut them lengthwise into strips as here indicated. This insures even cooking, and the cut stems will be ready when the floral parts are.

often "find themselves" during this high school period, and are led into fields of work and usefulness fully as desirable as the farm—if their likes happen to be in other directions.

Rather let your boy become a good machinist than a poor farmer. Let him grow up a good doctor rather than a poor farmer. In fact any honest toil in whatever work he chooses would be preferred to "bungling" his life with something in which he has no interest. But a high school education is a priceless asset, no matter what he plans to do.

G. S. S.

Your Fireplace

IF your brick fireplace needs cleaning, try this:—Pour two cups boiling water into your scrub pan. Add four tablespoons ammonia. With a perfectly clean scrubbing brush go over the bricks brushing down several times. Then as quickly as possible, go over them again this time using clear hot water.

Here you see a county book truck serving library material at a one-room crowded school in Hennepin county, Minn. This truck wore out in the service, and a splendid new car with closed body is on duty there this school year.

Doctors and Child Labor

By HEPSY NEFF

FIFTEEN physicians of outstanding repute recently agreed that child labor is a national menace—from a health standpoint. They condemned it as a major cause of physical unfitness among children and as the foundation for much illness, maladjustment and inefficiency among adults. A child's strength should be used for growth and development. Child labor during the teen age as well as just before, puts an undue strain on the child at an age during which even under normal conditions the tax upon him is greatest. On this the fifteen health authorities are agreed.

"Over-fatigue brought about by unregulated child labor is one of the chief reasons why many Americans are still physically unfit in spite of the vast increase in health work and health teaching.... Child labor contributes directly to the increase in three of the most serious diseases affecting American people today—heart disease, nervous diseases and tuberculosis.

"The fact that more people are suffering from nervous diseases today than from all other diseases combined cannot be separated from the question of child labor," is the opinion of Dr. Harris, former Commissioner of Health of New York City.

Much more along this line may be found to American Child Health News for February, 1930, but enough has been quoted to set us all thinking. No one holds that children should do no work, but it should be much less than is now the custom in some places and long hours are particularly harmful. Light tasks at regular times with more hours of play than of work, not occasionally but daily, coupled with such an interest in the real happiness of the child as shall promote a happy state of mind is the ideal we should set for ourselves.

Write to U. S. Department of Labor, Children's Bureau, Washington, D. C., for list of free bulletins on Child Health.

Do You Know Broccoli?

BROCCOLI has during the last few years gained great prominence in the United States. It is one of the leafy vegetables resembling cauliflower in its method of culture. The flower head, the part which is eaten is quite like cauliflower, except it is deep green. The lower end of the plant stem and the leaves are tough and should be trimmed off.

These flower heads are carefully washed then cooked by dropping into boiling water slightly salted. Cook for fifteen to twenty minutes in the uncovered kettle. Do not overcook. As soon as it is tender, drain, season to taste and pour over the platter melted butter or other melted fat. Occasionally dress it up with Hollandaise sauce.

It's a nice idea to try something new each year in your garden. Why not give broccoli a chance this year? It is liked by nearly every one, and has a frequent place on the most expensive plates served at banquets. It is tender and tasty, really a delicious green.

Feed Your Chicks PEARL GRIT

Right at the start, baby chicks need Pearl Grit No. 1. The pieces are the proper size and shape. Pearl Grit supplies mineral required for bone growth. It averts leg weakness, rickets. Builds resistance against diarrhea and other chick diseases. Has no odor or flavor to excite overeating and consequent binding or prolapsis of crop. Contains no harmful foreign elements; no sharp splinters to irritate digestive tract. It's safe, wholesome—and economical. Obtain Pearl Grit No. 1 for chicks—No. 2 for half-grown and adult birds—from hatcheryman or feed dealer at once. 10-lb. cartons or 50-lb. bags.

Write for free book—today! Get all the facts. They're explained in our valuable book. Find out how Pearl Grit increases poultry profits; why it is the ideal mineral feed for flocks of all ages. Don't delay. Start your chicks right and have great success. This astonishing book is yours for the asking. Mail postal or letter for it to: Pearl Grit Corp., 513 Bridge St., Lima, Ohio.

Snowballs and Log Cabins

DON'T they make you think of your grandmothers? They do me, and I can picture one of those dear old ladies in her black silk frock, her soft gray locks just peeking out from under the lacy cap. She was eighty-three when I watched her putting together the interesting strips she called the American Log Cabin Quilt.

We have this pattern ready for you now and another old favorite which every one loves—the Snowball. Both are especially good patterns in using up left-over scraps of material which accumulate in all sewing rooms.

The Log Cabin block is fifteen inches square, and the Snowball measures ten and one-half inches. Patterns come with complete directions for making. The pattern shapes are hand cut and accurate—ready to start the lovely quilt. We have seventeen other interesting old quilt patterns at the same price—fifteen cents each. Two quilting designs are the two for fifteen cents.

Send your orders to Home Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

A Bird Sanctuary

THE little pioneer cemeteries that are such an eyesore in many communities because no relatives remain to care for the graves of the departed, can easily and quickly be turned into bird sanctuaries with a little effort. Many states have a law forbidding any one to shoot in a burying place so birds are secure.

All kinds of native shrubs and berry and seed-bearing trees that will attract birds can be planted in the neglected spot. Wild cherries, mulberries, evergreens for winter shelter, haws, oak, elm and all kinds of trees will furnish shelter for the nests and for those that remain in winter. It may be that in time of deep snows they will have to be fed, but sportsmen all over the country are combining with farmers to save the wild life in severe weather.

These little spots will be very valuable to high school students, farmers who desire to keep alive birds that eat harmful insects, and all nature lovers the country over. Many of these neglected spots now have a good foundation of old trees and need only the trash and refuse and briars cleaned away to make room for more.

Hilda Richmond.

When you retire these March evenings remember what Napoleon said, "He who sleeps till noon cannot know how beautiful is the sunrise."

Before the Blizzard Struck the Schoolhouse

A Bell System Advertisement

TWENTY pupils were gathered one mid-winter afternoon in a little white schoolhouse in the prairie country of North Dakota. At half-past three there was a general ring on the telephone. Answering it, the teacher learned from the operator that a severe blizzard, moving at the rate of sixty miles an hour, was reported from a town fifty miles away. The families of a number of the pupils received this same telephone warning, and within ten minutes enough teams were at the schoolhouse to take all the children home in safety.

The teacher then fixed her fire, and was able to reach her boarding place before the blinding snow and wind isolated every building in the countryside.

The telephone renders valuable aid in any emergency—in cases of accident, sickness and fire. Whenever there is livestock, hay or grain to be bought or sold, the telephone gives profitable assistance in arranging the most advantageous terms. It is always ready to run errands, bring spare parts for broken machinery, or keep families and friends in closer contact.

The modern farm home has a telephone that gives service, rain or shine.

A Long-wearing MUD TIRE CHAIN

Ask for the
WEED AMERICAN

THE WEED AMERICAN doubles the usual wear

This new tire chain doubles the wear you expect. It has re-enforcing bars of steel across the cross links that contact the road. They are welded on electrically. It has also a new electrically welded side chain. The result is much more mileage per pair of chains.

In fact, this new Weed American tire chain seemed too good to be true, so we abused it, misused it, and tried it out on every sort of road and testing ground. For two years we abused it. It stood up twice as well. So now we are telling you about it, and your dealer sells it. It's a great mud and rut chain. Look it over. That's all we ask.

AMERICAN CHAIN COMPANY, INC.

500,000 Farmers Have Borrowed from the 12 Mutual Federal Land Banks a Billion and a Half Dollars at an average interest rate of 5.4%

THIS \$1,500,000,000 in long-term loans secured by first mortgages on their farms provided much needed capital during a period when funds were scarce and the average farm income low. All but a small percentage of these farmers have met their obligations. The 12 Banks have total capital, legal and other reserves and undivided profits aggregating more than \$64,000,000. Their total assets exceed \$1,300,000,000. The net carrying value of the real estate, shares' certificates and similar items owned by the 12 banks on November 30, 1929, was only 1.1% of their assets.

The services of the 12 Banks and the National Farm Loan Association through which the loans are made have been of inestimable benefit and they will increase in the future.

The 12 Federal Land Banks are located at
Springfield, Mass. New Orleans, La. Wichita, Kan.

For collar, belt and pockets of contrasting material ¾ yard of 36-inch material is required. Cut crosswise. The width of the dress at lower edge with fullness extended is 2½ yards. Price 15c or two for 25c.

No. 6791.—Girls' dress. Cut in four sizes: 2, 4, 6 and 8 years. A four-year size requires 1½ yards of material 35 inches wide. To trim with lace requires 3¼ yards. Price 15c or two for 25c.

No. 6776.—Ladies' slip. Cut in four sizes: small, 36-38; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 2½ yards of 36-inch material. Price 15c or two for 25c.

HOW TO ORDER

Write your name and address of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Like handing you
\$50

If \$50 were handed to you as a gift, it would be about the same as the saving you make on a Speed Queen. Because this nationally famous Aluminum Washer sells for \$50 less than other machines of similar high quality. You can make thorough washing tests—side-by-side comparisons—and you will find the Speed Queen equal to any of the highest priced machines in every respect. Compare guarantees. No washer carries a stronger written guarantee than the Speed Queen. If a saving of \$50 is important to you—mail the coupon below for interesting folder describing the SPEED QUEEN and also giving the name of our dealer in your town.

Note These Quality Features:
Large Ballroom Winder Rolls
Polished Aluminum Tub
(Or Choice of Porcelain Tub)
Submerged Aluminum Agitator
Removable Splash Ring
Standard Capacity
Double Walls to Keep Water Hot
Self-Oiling Bearings
Enclosed Mechanism
4-Cycle Briggs-Stratton Gasoline Engine

For homes having
electricity, the
SPEED QUEEN
is available with
a high grade electric motor.

A REAL EASTER BUNNY—No. 3561

THE thrill and pleasure that comes to every kiddie in the home, with the arrival of Easter and the Bunny who hides his vari-colored eggs all over the house, can now be prolonged throughout the entire year. We have originated this large and most attractive design of the Bunny Doll, carrying a basket in which are shown the wonderful Easter eggs in many colors. He has also the great long ears that every child will be glad to fondle and caress.

It is 21 inches in height by about nine inches in width and comes already stamped for the simple embroidery on fine quality Venetian cloth in green only, enough material being furnished for both front and back of doll. Price of the doll, post-paid to any address, is only 35c; if you wish us to include sufficient floss for completely finishing the embroidery, the price is fifty cents.

Address: Embroidery Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Hunt Up "Handy Anne"

HANDY Anne spent a day in my kitchen lately and when night came many things had been done that save my time, temper, footsteps and strength. First we raised the wood-box so that the top is on a level with the top of my range. Two empty dynamite boxes were slipped under it, and now I need not bend over double when the box is nearly empty.

Two small wooden boxes were fastened with screws on the inside of the big cupboard doors. The long shallow box holds my egg beater, cookie cutters, funnel, egg separator and strainer. The deep box holds the food chopper. All I need do now is open the cupboard door and there are my tools, no hunting, no bending. The inside of these cupboards and these handy boxes were then painted a cheerful straw yellow.

Another cupboard holding household necessities not often used or needed has a long narrow door. Here we fastened a strip of old inner tube from top to bottom of this door. We then used tacks and spaced off proper lengths of tube to hold small wrenches, files, screw drivers, pliers and a small hammer. In the spacing we were careful not to use the space opposite a shelf. Just tack that portion flat and tight in the beginning, then no mistakes will occur.

Now we wonder why we didn't think of some of these little helps long ago. It pays to investigate our kitchens. Then some rainy day when the handy man is fidgety let him be "Handy Anne" and use the means at hand to improve your kitchen workshop.

Mrs. E. A. Kern.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR
That's why

FELS-NAPTHA WASHES COLORS SAFELY

FELS-NAPTHA is particularly easy on colors for a very good reason.

You've heard of naphtha. It's the safe, effective dirt-loosener used in dry cleaning. There is plenty of naphtha in Fels-Naptha. Your nose tells you so! Plenty of naphtha combined with good golden soap. Working together, these two cleaners give extra help that gets dirt out but leaves colors in. Moreover, this extra help loosens dirt without hard rubbing even in cool water, which is a real advantage in washing colors.

And don't forget that Fels-Naptha's biggest job is the family wash. Here, too, it's always ready to give you extra help—whether you use it for soaking

or boiling, in tub or machine, in hot, lukewarm or cool water. And because it works quickly and gets your hands out of water sooner, Fels-Naptha helps keep your hands nice. Get a few hers at your grocer's today.

FREE—a Fels-Naptha Chipper. Many women who chip Fels-Naptha into washing machine, tub or basin find it handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha) just as you need them. Sent free and postpaid on request. Write today. Dept. 7-3-15. Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

FELS-NAPTHA

Don't let SORE THROAT get the best of you..

FIVE minutes after you rub on Musterole your throat should begin to feel less sore! Continue the treatment once every hour for five hours and you'll be astonished at the relief you'll experience.

Working like the trained hands of a masseur, this famous blend of oil of mustard, camphor, menthol and other ingredients brings relief naturally. It penetrates and stimulates blood circulation and helps to draw out infection and pain. Used by millions for 20 years. Recommended by doctors and nurses.

Keep Musterole handy—bars and tubes. To Mothers—Musterole is also made in milder form for babies and small children. Ask for Children's Musterole.

Read the Advertisements
they keep you to the fore of modern life. Through advertisements you've laid down the shovel and the hoe. You can buy a whole harvest ready-to-eat in cans. You've hung up the fiddle and the bow, for a radio. There's little old-time work left in this age of amazing short-cuts. Read the advertisements carefully and when answering them, say you saw their ad in Pennsylvania Farmer.

These pullets are part of the flock that F. E. Lewis, of Nankin, Ohio, saved out of the 1975 chicks he raised last spring. Figured at a dollar apiece, the 987 are worth \$987. He sold the roosters for \$506.95. Roosters and pullets both add up to \$1493.95. They cost him \$553.21. That's figuring feed, heat, cost of the chicks, cost of Dr. Hess Poultry Pan-a-min, cost of everything at 10 weeks. Subtracting this \$553.21 from \$1493.95 leaves him \$940.74 net profit. He gave these chicks Dr. Hess Poultry Pan-a-min regularly from the day they were old enough to eat.

1975 chicks lived... 25 died

POULTRYMAN F. E. Lewis, of Nankin, Ohio, had 2000 chicks just out of the shell on April 9 of last spring. Ten weeks later he still had 1975 of them... alive... healthy... past the danger age. He had raised all but 25 of those 2000 chicks.

He had raised more than 98% of this big brood while many poultrymen were raising only 60% and less.

These chicks were fed a good starting ration, supplied with fresh water, handled carefully... and one thing more in addition to feed and care. They received Dr. Hess Poultry Pan-a-min regularly from the time they were old enough to eat.

Dr. Hess Poultry Pan-a-min contains a

full supply of minerals which are essential to the rapid growth of feathers. It contains tonics to promote appetite, keeps chicks hungry and hearty, which enables them to resist the ravages of disease. Pan-a-min chicks live where others are dying. They grow and develop into quick profit. (See profit figures above the picture.)

Take your chicks through the doubtful weeks with Dr. Hess Poultry Pan-a-min this spring. Shield them from sickness and bad weather. It'll cost you only a penny a chick for ten weeks. It'll pay you profit in lives saved... whether you are raising two thousand or two hundred.

Dr. Hess & Clark, Inc., Ashland, Ohio

Also large numbers of seed, poultry, stock food and implement advertisements. When answering them, mention Pennsylvania Farmer.

I Sell Dressed Birds

MY specialty is selling dressed chickens at the flat price of \$1 apiece from the time the chickens have reached the broiler stage until the last of the surplus is gone in the late summer or fall. I have sold as many as six hundred of these birds in a season, which means a nice lump of money for a farm woman to enjoy. Of course there are eggs also to sell but for me the dressed chickens pay the better profit, and the work of dressing and marketing is not so confining as the close attention necessary to high-powered egg production.

Because I supplied about forty regular customers in Pikesville, Maryland, with butter once a week the opportunity was afforded me to supply dressed chickens as well. My butter customers spread the news of my nice fat birds and the orders therefore increased. The most I ever had to dress in a single day was twenty-seven chickens. Almost any of the delivery days through the season the demand is for ten or a dozen and the orders come to me over the telephone.

Customer Satisfied

This is an age of service in business. You see it demonstrated everywhere. If the quality of the service is on a par with the public requirement not much objection to the price is ever made. I applied this truth to the business of selling dressed chickens. I discovered that women in town as a rule do not like to draw the carcass and much less do they like to cut it up in pieces. So I prepare the fowl to suit the customer's choice, drawing it for the roast or dividing it for the pot or the frying pan. Very seldom is a customer so penurious that she will object to the flat price of a dollar.

My first chickens are sold when their weights are about two and one-half pounds each. Last year I received 50 cents a pound for the first ones, or about \$1.25 apiece, because of extra earliness and the high prices in the regular market.

Looking forward to the dollar price for the dressed poultry I send the eggs of my own Barred Plymouth Rocks to a commercial hatchery in time for hatching, about March 1st. This plan seems more economical and convenient for me than that of fussing with incubators at home, where there is plenty of work to do anyway.

The chicks are grown like any others through the starting and growing mash periods, but as they become large enough for sale, lot by lot they are put on a commercial fattener to be fed about ten days. Fat chickens, the same as drawn or cut up ready for the cooking, please the women of the better appointed homes that I visit.

Because our farm is not more than five miles from the city, delivery of special orders for dressed poultry is soon accomplished, but the bulk of the orders are received for Saturday delivery, when also about 25 or 30 pounds of butter are due for the same trip. Altogether these make a nice weekly income. Mrs. J. P. Nawrot.

Green Feed

EXPERIMENTS to determine the effect of feeding on fertility have shown that green legumes, such as clover and alfalfa, are important in giving fertile eggs. Alfalfa leaf meal is also good in this respect. I put 50 pounds of alfalfa leaf meal in my mash mixture, which weighs about 600 pounds per batch, and got 85 per cent fertility in eggs gathered during the fore part of January, from hens which were confined to the buildings. In using alfalfa in the mash, be sure to get the leaf meal rather than the ground alfalfa, which contains the stems and is too bulky and full of fiber for poultry feeding. R. L. S.

THE all-mash ration for baby chicks as fed at the Experiment Station farm, New Brunswick, provides the nutrients necessary for good growth and development with a minimum expenditure of labor by the poultryman.—N. J. Exp. Station.

Danger of Infection Among Baby Chicks

Success in raising baby chicks is dependent upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of contaminated drinking water. Baby chicks must have a generous supply of clean water. Drinking vessels harbour germs and ordinary drinking water soon becomes contaminated and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Take the "safety" in time that comes now. Remember, that in every chick—danger of diarrhea in one form and other loose bowel and intestinal troubles. Don't let a few chicks infect your entire flock. Give Tablets in all drinking water the first two weeks and you won't lose one chick where you lost dozens before. These letters prove it:

Bradshaw's Remarkable Success in Raising Baby Chicks

Dear Sir: I see reports of so many raising their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy ones from bowel troubles, tried many remedies and was about discouraged. At last resort I sent to the Walker Remedy Co., Dept. 500, Waterloo, Iowa, for their Walko Tablets for use in the drinking water of baby chicks. I used 50c packages, raised 300 White Leghorns and never lost one or had sick after using the Tablets and my chicks are larger and healthier than before. I have found this Company thoroughly reliable and always the remedy by return mail.—Mrs. M. Bradshaw, Beaconsfield, Iowa.

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shenandoah, Va., writes: "My first incubator hatch when but a few days old, began die by the dozens. I tried different remedies and was about discouraged at the chicken business. Finally I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko Tablets to be used in the drinking water for baby chicks. It's just the thing to keep the chicks free from disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko Tablets entirely free of risk—postage prepaid—so you can see for yourself what a wonderful remedy it is when used in the drinking water for baby chicks. So you are protected—as thousands have proven—it will reduce your losses and, while, treble, even quadruple your profits. Send 50c for a package of Walko Tablets (or \$1.00 for extra large package) in all drinking water and get results. You'll find you won't lose a chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the best little chick saver you ever used. The Pioneer National Bank, the largest and strongest bank in Waterloo, stands back of our guarantee.

Walko Tablets are sold by leading druggists and poultry supply dealers. WALKER REMEDY CO., Dept. 500 Waterloo, Iowa

Success with Your Planting

Horticulture Bees and Spray

Two years ago I got a hive of bees, and we do not want to give them up. Our apple orchard, however, will have to be sprayed more thoroughly if we want useable apples. We tried to spray at the right times according to our county agent's notices in the local paper, but we did not spray while the apples were in full bloom on account of the bees. Several people in the vicinity did spray then and had nearly perfect apples. We had railroad worms and some form of rust till our apples were useless.

We used lime-sulphur, arsenate of lead, and nicotine sulphate according to directions from our agricultural teacher at high school.

Mrs. Raymond Hower.

THE material in your spray that kills the bees is the arsenate of lead, not the lime-sulphur or nicotine. If it becomes necessary to spray while the trees are in bloom, arsenate of lead should not be added. The other materials may be used, and will help to control the pests that are most dangerous at that time, the lime-sulphur for fungous diseases, as scab, and the nicotine for plant lice.

Rarely, however, is it necessary or desirable to spray when the trees are in full bloom; very few commercial fruit growers do. A safe rule is to wait until two-thirds of the petals have fallen. Spraying trees while in bloom may injure the blossoms and reduce the set of fruit. Dusting, with sulphur alone, does not injure the blossoms.

The "trust" you speak of may have been caused by too strong a spray solution and unfavorable weather; russeting was quite common last year. Follow your County Spray Service, but do not spray while the trees are in bloom; you owe this much to the bees, which aid in the setting of fruit, by carrying the pollen from blossom to blossom. S. W. F.

Pruning Problems

It is up to me to do some pruning and grafting work this spring. I am a greenhorn. If you can help me out I shall be most thankful to you.

Wm. F. Dills.

THE type and amount of pruning depends on kind of fruit, variety, age and condition of the tree. Peaches are commonly pruned much more severely than apples; thick topped, twiggy varieties, like Rome, require more pruning than open growers, like Stayman; young trees, not yet bearing, should be pruned much less heavily than old trees. Each tree is a new pruning problem, requiring judgment in the application of these principles.

In general, the pruning of young trees should be directed mainly to forming a well-balanced framework of scaffold limbs, spaced far enough apart to make breakage unlikely. The less a young tree is pruned beyond what is necessary to shape the top, the better; heavy pruning reduces the leaf surface, retards growth and delays the time when it will come into bearing.

The older the bearing trees, the more severely should they be pruned. This will consist mainly in thinning out the crowding branches and twigs so that sunlight may strike through the tree.

Heading back the main branches to side limbs is desirable only when old trees are to be renewed in top; it is more commonly practiced with peaches than with apples. It is better to cut out many small branches and twigs all over the outside of the tree than a few big limbs on the inside of the tree. Pruning may be done to advantage any time that the wood is not frozen and until blossoming time. Only when large limbs are removed from the trunk do wounds need to be painted; thick white lead paint is best. Burn the prunings; do not leave them in piles on the edge of the orchard. S. W. F.

SPREAD of noxious weeds can be prevented, to a large extent, by careful handling and buying of seed.

Hoffman FARM SEEDS

Hoffman Seeds are cleaned and re-cleaned. No foul weeds. Germination tested. Hardy, vigorous, quick-starting.

"The most wonderful crop of corn in this part of the country. People came from all over to see it," says J. D. Noughton. "Your Shadeland Eclipse oats yielded twice as much as my own seed oats. I shall plant that variety next year and nothing else," says Louis F. Boger. "My neighbors plow up their alfalfa in two or three years. Mine has stood eight years," says Randolph Moler.

Clover: U. S. Verified-Origin. 99% clean—no foul weeds. Germination tested and adapted to your climate. The best seed that can be bought.

Oats: Nine tested heavy yielders. Hardy, Northwest seed. Cleaned clean. Early and mid-season varieties.

Corn: A dozen varieties, for husking and ensilage. Grown for seed and germination assured by our special Corn Drying Process. Lancaster County "Sure Crop," "Long's Yellow Champion," etc.

Potatoes: Best northern grown, disease-free varieties from Maine and Northern Michigan. Irish Cobblers, Green Mountain, State of Maine, Michigan State Certified Russets, etc.

Garden and Truck Crops

By GILBERT S. WATTS

Cucumber Beetles

I noticed in some agricultural paper about a year ago (perhaps not yours) that camphor balls placed on melon hills on the surface or slightly covered prevented their plants from destruction by insects that feed on or near the surface. Do you think that such is a fact? A. C. Garrett.

ALTHOUGH I have no experience in using camphor balls to cover insects off cucumber and melon hills it is possible that they would be of some value, but probably would be too expensive except on a small scale.

The standard repellent for cucumber beetles is one pound of calcium arsenate mixed with 20 pounds fine ground gypsum (or pulverized limestone if gypsum is unobtainable). Hydrated lime may be used but is likely to cause stunting of the plants if heavy applications are required.

In very warm, mild weather nicotine dusts are effective. G. S. W.

Asparagus

On going over your article "Asparagus Tips" in January 25th issue I would like to have some advice on same. You mention width but not depth. What would be the right depth to plant roots? What is the best fertilizer for asparagus? How often should it be limed? Wm. Taylor, Jr.

It is the usual practice to apply lime before planting if the land is sour and to lime even after the bed has come into bearing if an acid condition develops.

Fertilizer practices vary greatly. One program that has given good results has been to work 1,000 pounds per acre of 5-8-7 into the soil before the cutting season begins and to apply 1,000 pounds more of the same material at the end of the cutting season. In addition 200 pounds per acre of nitrate of soda and 150 pounds of muriate of potash are applied early in August. Finally 200 pounds of nitrate of soda is applied the first week of September.

It is customary to plant about eight inches deep but in a shallow soil I would rather plant six inches deep than have the roots set in raw subsoil. An inch or two of covering will be sufficient at first, a little soil being worked into the trench at each cultivation until the surface is leveled. G. S. W.

To Kill Gophers

Will some of the many readers of the Pennsylvania Farmer tell me how to rid my garden of gophers? Please publish remedy. T. K. Ransom.

GOPHERS, and groundhogs too, may be killed by saturating a corn-cob, ball of cotton waste or other absorbent material with carbon bisulphide and pushing this plug as far into the burrow as possible. Immediately close all openings with earth so that the gas which will be given off will not escape. Keep carbon bisulphide away from lights and fires as the gas is very inflammable. Also avoid breathing it.

Granulated calcium cyanide may be used in much the same way, simply inserting the material in burrows and closing all openings.

If you wish to use a poison a formula that is popular in California follows: Sweet potatoes, parsnips, or carrots, 4 quarts; flour paste, 1/4 pint; strychnine alkaloid, powdered, 1/4 ounce; saccharine, 1-32 ounce.

Procure the last two items at a drug store and stir into the cooked flour paste. To compel the gopher to eat the vegetables immediately instead of storing them cut into pieces not less than three-quarters of an inch in diameter. Pour the poisoned paste over the cut vegetables and mix thoroughly. Probe the ground around an exit until the main runway is found. Remove the probe, drop one of the

cubes into the runway and close the hole. Kick down all old mounds so that new ones will show where to place poison to get the survivors. G. S. W.

Premature Celery Seeding

INVESTIGATORS have established quite clearly that development of seed stalks instead of marketable celery is primarily the result of long continued low temperatures while the plants are small. Prof. H. C. Tompson of Cornell University states:

"Subjecting young celery plants to relatively low temperature (40 to 50 degrees F.) for two weeks or longer is likely to result in premature seeding. When plants are hardened in the cold frame in early spring, there is always danger of such seeding."

This point was mentioned last summer but with plant growing operations now going at full blast repetition may serve as a reminder.

A RECENT Cornell Bulletin No. 475, calls attention to the fact that three-fourths of the peas grown in Erie county, New York, are of the Thomas Laxton variety. Peter Pan, Laxtonian and Gradus are the only other important low growing varieties. Highest yields have been obtained with plantings at the rate of two and a half or three bushels of seed per acre. The tall late peas are practically all of the telephone type. Alderman, Prince Edward and Duke of Albany are most popular.

Vegetable Bulletins

NUMEROUS requests are received for the names of bulletins on vegetable crops. Those listed below may be secured without charge by interested persons upon application to the respective institutions.

From the Pennsylvania State College, School of Agriculture and Experiment Station, State College, Pa. bulletins: No. 221, Early Cabbage.

Extension circulars: No. 93, Protecting Cabbage from the Root Maggot; No. 122, Vegetable Garden Insects; No. 123, The Family Vegetable Garden.

From the Pennsylvania Department of Agriculture, Harrisburg, Pa. bulletins: No. 413, Greenhouse Fumigation; No. 447, Mexican Bean Beetle; No. 448, Weeds, Eradication and Control; No. 454, Direct Marketing of Farm Products in Pennsylvania.

From U. S. Department of Agriculture, Office of Information, Washington, D. C. Farmers' Bulletins: No. 937, The Farm Garden in the North; No. 829, Asparagus; No. 289, Beans; No. 433, Cabbage; No. 1269, Celery; No. 1320, Cucumbers in Greenhouses; No. 1318, Greenhouse Construction and Heating; No. 1418, Lettuce Growing in Greenhouses; No. 354, Onions, culture; No. 1233, Tomatoes for Canning and Manufacture; No. 1338, Tomatoes as a Truck Crop; No. 1431, Greenhouse Tomatoes; No. 1371, Vegetable Diseases and Insects; No. 1250, Green Manuring.

Hot-Bed Construction

Would like to know if you have a pamphlet or bulletin on hot-bed construction. J. T. Robson.

IF you will write the New Jersey State College of Agriculture, New Brunswick, N. J., and request a copy of Extension Bulletin No. 51, entitled "Plant Growing and Plant-Growing Structures," you will receive without charge what is considered one of the most complete and up-to-date publications on the subject. You will find therein numbers of extremely clear and helpful photographs. G. S. W.

Eureka

SPRAYERS

Traction or Power

Do the biggest, most important job in raising field crops and fruit. Increase yield 50 to 200 per cent. Improve quality. Insure investment by destroying bugs, preventing mold and blight.

Traction Sprayer has 1, 2 or 3 nozzles per row; 4, 6 or more rows per boom. Wheels adjustable to width of rows. 60 to 100 gal. tanks. Double or triple action pumps. Thousands of satisfied users.

Combination and Power Sprayers for orchards, groves, and field crops, have 2 cylinder pump; pressure regulator; several sizes of engines and tanks for pressures 200 to 400 lbs. with spray booms and guns.

In stock near you. Write for Catalog on Eureka Sprayers

Science in agriculture

IN agriculture as in industry, the *practical results* of the work of the scientist are evident on every hand. Indeed, today, "Science is the best dirt farmer in the world."

New York Central Lines urge every farmer to make full use of the research of the highly trained experts tirelessly laboring to make American farming more productive and profitable...It is *good common sense* to keep in close touch with the work of your agricultural college and experiment station either direct or through their extension forces.

Every progressive farmer knows how scientific knowledge, like up-to-date power machinery, can lessen labor and cut down costs in the modern agricultural "business." Call on practical science to help you solve your soil, seed, equipment or marketing problems.

A Trader Encouraged

By FRANK K. RICH

"MORE'N ten years back," Caleb Peaslee remarked to Deacon Hyne, "when Peter Gibbons sold out and moved away, I bought a lot of things of him; things I wanted and figured I'd have a use for some time or other. There was a set of double harnesses, for one thing, and a two-inch fence-auger, and a couple of double-bitted axes, and a wind-mill contraption to winnow peas and a number of other things I no need to try to specify; enough to run into considerable money if I'd had to pay full price for 'em—and it about ruined two ten-dollar bills, as it was."

"Do you figger," the deacon demanded a little maliciously, "that you ever got twenty dollars wuth of good out of the whole mess? I'll bet you didn't," he added, forestalling Caleb's reply.

"Well," said Caleb placidly, "I'm goin' to tell you—but fust I want to speak about somethin' else I got. When I'd piled the stuff up, ready to cart away, I found I'd piled it on top of a box mebbe two foot square and when I come to load the truck I'd bought onto my wagon, Peter kicked the box under the pile and he says to me:

"There's somethin' you might as well take along with you," he says. 'I'll throw it in with the trade, so it won't cost you anything—and I'll be rid of it, so we'll both be the gainer.'"

"Glory Box"

"I took hold of the box and hefted on it and it was as heavy 'sif it was filled with lead. 'What's it filled with?' I wanted to know.

"One thing and another," Peter says. 'It's what I've always called my 'glory-box,' and I've kep' it handy to throw things into when they seemed too good to leave away and I've found it useful more'n once.'"

"Well, I didn't feel overly keen to take it, not wanting to clutter my shop up with stuff, but Peter was so sot on me takin' it that when I come to load up the rest of the dunnage I piled that onto the load along with the rest of the stuff; and when I got home I put the box into the corner of the shop and sort of let it go out of my mind for the time bein'.

"And now comes the meat of the whole thing," he explained. "I've never used the double harnesses from that day to this, bein' they was made for a pair of fifteen hund'ud hosses—and my hosses, even if they was fat, wouldn't weigh over twelve hund'ud. And what fence I've built, late years, has been wire, so I've never needed the fence auger. And I took out one of the axes to use and I found it didn't balance the same as a pole-axe, so I couldn't hit twice in a place with it and I made a notch so ragged I was ashamed to look at it. And I c'n buy seed peas cheaper'n I c'n raise and winnow 'em, so the fannin'-mill didn't pay me anything—and so on with the other things I fetched home that time from Peter's."

Fool's Luck

"So you c'n figger, the same as I did, that c'n siderin' I didn't use one single thing that I'd lotted on usin', I didn't make such a very payin' bargain—though mebbe some time I'll sell or trade some of the things and git a part of my money back. I'm hopin' Jed Piper'll feel he wants the harness; his hosses are bigger frame than mine are and mebbe the harness'll fit 'em. I'm goin' to mention it to him, anyway."

"But if I don't git rid of the things at a profit," he went on, "I want to tell you where my satisfaction comes in—and all without aim or purpose on my part—just the luck of the witless, so my wife maintains."

"Out of that glory-box, that I toted away under protest, 's you might

say," he went on complacently, "I've took out old knobs and latches 'nough to fit out five doors in the new ell we built to take care of summer boarders; and I've salvaged staples to fasten thirty rods of wire fence; and brass screws without number for odd jobs 'round the house; and four knives without handles that I've fixed up and ground sharp; and about a dozen bits that'll bore holes from a quarter inch up to an inch—they'd cost me three dollars, s'posin' I had to buy 'em new; and two pretty good wood rasps—and I ain't begun to make a hole in the stuff in that box yit!"

"It's couraged me a lot," he admitted, "and mebbe I'll keep on tradin' when I git a chance, after all. I felt kind of cast down b'fore I found the use of that glory box, and about d'cid-ed I'd quit tradin'—but now I dunno. Mebbe it's as my wife says—the luck of the foolish'll p'tect me, whatever trade I make."

Seventy-Eight Years Ago

THE long evenings were the brightest part of the 24 hours. The boys would lug great logs of oak and hickory into the house and lay them across the andirons. Then the flames would surge up the wide-throated flue and fill the room with a glare of light that made the home-dipped candles fail into insignificant paleness.

Around the tables the family gathered with books. Father took the dear old family Bible and perused its sacred pages, to learn the sweet lessons of love, while mother was knitting or sewing. The boys and girls toasted big apples and ate nuts and popped corn by the open fire. A rich air of good cheer and cozy comfort pervaded the whole room.

There were no outside attractions that drew us young people away unless for a sleigh ride to a neighbor's to a spelling bee or cottage prayer meeting, which in those days were held every Wednesday, Saturday and Sunday night.

Few Want to Return

There was much solid reading in the family circle and as a rule there was companionship in all literary matters. Individual taste could not always be gratified because of the paucity of books, but what one read the others read. Dime novels, love stories and trashy literature in general found no place in the old bygone homes of that age. This literature had not made its way into the homes at that early date.

But in spite of the glamour of the firelight and the stronger glamour that memory and associations cast over those quiet evenings of 78 years ago, few are the wise people who would want to return to those days. The better illuminations that our modern lamps offer is suggestive of the brighter luster that the present gives to other things.

The absence of the open fire we may be permitted to regret. It is true no doubt that foolish fashion removed it. But the many other advantages of today make the past seem narrow and confined. What a flood of literature has been poured out upon the homes by the score since the days of the old tallow candles. The land is now nearly flooded with atheism, infidel and skeptic, also evolution matter.

S. S. W. Hammers.

"I had a'nawful good breakfast," said Johnny.

"So did I," said Emmy Lou, "I had somethin' specially nice that begins with 'N'."

"A norange?" suggested Johnny.

"No."

"A napple?"

"No, it was a negg."

Into every BODY BY FISHER is built unusual durability and convenience

LOOK TO THE
BODY

LOOK TO THE
BODY

ALL Fisher Bodies are of wood-and-steel construction—the finest type of body construction known to the body building art. Enormous resources and unequalled facilities enable Fisher and General Motors to build bodies of superior wood-and-steel construction for motor cars in all price fields.

The framework of a Fisher Body is of selected hardwood, scientifically reinforced with powerful steel braces and covered with strong steel panels. Fisher Bodies stand up unusually well because of their structural strength and thus increase owner satisfaction and

motoring comfort. Fisher offers in addition to this greater durability many features of convenience. One of these is the adjustable front seat that may be adjusted quickly and easily to suit the convenience of the individual driver. Another, is the Fisher non-glare vision and ventilating windshield which reduces the

annoying reflections of windshield glare, permits unobstructed vision through a single pane of plate glass, and allows at the same time a thorough and scientific ventilation of the car. It may be adjusted as desired with one hand, even while the car is in motion.

When you buy a General Motors car, you make sure of this greater durability and convenience. Naturally, too, Fisher Bodies give added value and more pronounced leadership to General Motors cars, which are the *only* cars offering to the motor car buyer the important advantages of Body by Fisher.

GENERAL MOTORS

When Twilight Comes

When twilight comes, thousands of farm homes and buildings are lighted—lighted at the touch of a button—lighted by electricity, which is cleaner, cheaper, safer, and infinitely more convenient than the old methods. ¶ To be certain of the most economical and trouble-free electric service, install the G-E Wiring System and use G-E MAZDA lamps on your farm. ¶ Electricity is

bringing new profit to farms. The application of G-E motors does swiftly and cheaply hundreds of the old, slow, and tiring farm jobs. And in the farm home, electricity cooks, cleans, washes, irons, and refrigerates. ¶ If you are located on or near an electric power line, ask the power company for complete information concerning the possible uses of electricity on your farm.

Tune in on the General Electric Special Weekly Farm Program on WGY (Schenectady). In addition, join us in the "General Electric Hour" broadcast every Saturday at 9 P. M. Eastern Standard Time, on a nation-wide N. B. C. network.

Good lighting in the kitchen saves time and eyesight

Yard lighting makes your going easy and discourages marauders

A path of friendly light between house and barn

Farm tasks are more quickly and easily done under good light

The New CHEVROLET SIX

—more for your money than ever before

Those who seek the utmost in motoring satisfaction, at a price so low as to be within the reach of all, are invited to see and drive the new Chevrolet Six.

For, again, Chevrolet has used the savings made possible by its great volume production to build a smoother, faster, better Six—a Six that is, by every standard of comparison, the Greatest Chevrolet in Chevrolet History!

Not only does this new car retain all those basic qualities which have won for Chevrolet such great success in the past—but, in addition, it offers scores of specific improvements which vitally affect performance, comfort, safety and endurance.

Lighter, stronger pistons, with bronze bushings; fully-enclosed, internal-expanding brakes; Delco-Lovejoy hydraulic shock ab-

sorbers, both front and rear; sturdier transmission; heavier rear axle—these are typical of the engineering advancements found throughout the entire design of the car.

The new Fisher bodies have likewise been made better in every way. A new non-glare windshield, in all closed models, makes night driving safer and more pleasant. Upholsteries are richer and more durable. Seats are deeper and wider. A new instrument panel carries every device for perfect control of the car—including a new gasoline gauge. And construction throughout is stronger and sturdier.

But no listing of features can give you any idea of the extra quality and value provided in the new Chevrolet. You must see and drive this finer Six to learn how much more it gives for your money. Visit your Chevrolet dealer today!

Chevrolet Motor Company, Detroit, Michigan
Division of General Motors Corporation

SIX IN THE PRICE RANGE OF THE FOUR

THE EXTRA PROCESS THAT BROKE ALL RECORDS

Fertility treatment tests made on corn by U. S. Department of Agriculture Experiment Station, showed that in plot No. 1 where a specified fertilizer was applied, the time from planting to silking was reduced by 25½ days from that of plot No. 2, which received no soil treatment. The yield was increased from an average of 11.6 bushels to 68.8 bushels per acre. If interested in further details, write for U. S. Government information and the booklet, "The Secret of a Long Life," which will be mailed to you without charge. Address: FIRESTONE TIRE & RUBBER COMPANY, Akron, O., or, Los Angeles, Calif. — or, Hamilton, Ont.

TIRE - TUBES - BATTERIES - BRAKE LINING

THE extra process applied to soil means the addition of certain elements that produce prize-winning crops.

The extra process applied to tires means the addition of Gum-Dipping, which doubles the flexing life of the tire, increases mileage and provides a greater degree of safety.

The size of crops which you take out of your soil will be in relation to the extra quality of the seed, the fertilization and cultivation you put into it.

In order to take more mileage out of tires, something extra must be put in. Gum-Dipping... the extra process used only in the manufacture of Firestone Gum-Dipped Tires... saturates and insulates every fiber of every thread within the individual cord with live rubber. This process minimizes friction and heat, the greatest enemy to tire life.

Insist upon Firestone Gum-Dipped Tires, built with the extra process, and assure yourself a bumper crop of extra miles of tire service at no additional cost. The Firestone dealer in your community will save you money and serve you better!

A long beam put across rear of tractor with one disc at each end and the third in the middle does not work well, as front wheels of tractor slide side-wise in turning.
-Hitches For Three Discs Behind Tractor- D635.

To Get the Most Out of Tractors

FUEL and oil are the most noticeable items of tractor cost, but in themselves are really of minor importance. Modern tractors are fairly economical in the use of fuel and oil. Nothing can be saved by stinting the quantity or lowering the quality of the cylinder oil.

Sometimes the fuel and oil used, as well as the cost of man labor, are too high per unit of work done because the tractor load is too light. Thus a two-row corn planter is a light two-horse load, and pulling this with a tractor intended to do as much as ten horses is not very efficient of fuel and especially of oil and man labor. On the other hand it doesn't pay to load a tractor to the point that serious wheel slippage occurs or the speed of travel is below that at which good work can be done.

To Reduce Upkeep and Lost Time

A careful and efficient operator helps in making a tractor profitable by avoiding accidents and breakage, by greasing and changing oil at regular intervals, by tightening bearings and making other adjustments before damage results, and by doing such adjustments and overhauling at such times as will not conflict with its use when needed. He can also help much by adapting the tractor to more and more of the farm operations.

More Days Use per Year

Undoubtedly the best chance of cutting tractor costs and increasing the power farming income is by getting more hours work per year, thus cutting down such overhead costs as interest, shelter, taxes, and a very considerable part of the depreciation.

This added profit of more hours use per year depends very largely on the owner's ability as an agricultural engineer and farm manager, since it means the careful selection of the tractor to fit the farm's needs, the proper correlation of the farm operations with tractor power, the engineering ability to devise hitches and other means for making the best use of the equipment at hand, and the ability to cooperate with his neighbors in the exchange of equipment and labor.

If a small farmer finds himself with a large size separator, he would be foolish to buy a large tractor to operate it say two or three days per year; since he could hardly afford to buy the large plows and other equipment to go with such a tractor and he would have to spread his heavy interest and other overhead charges over two or three days' use, making these costs perhaps \$50 to \$75 per day.

ARMOUR'S BIG CROP FERTILIZERS

make your soil take off its coat and go to work

AN INVESTMENT in fertilizer is the most profitable money that a farmer can spend. A survey including 47,628 farmers in 35 states showed a net return of \$3.54 for every dollar invested in fertilizer. A return of \$5 and more was not unusual.

Properly made, correct-ratio fertilizers, liberally applied, increase yields and decrease growing costs. They improve quality and increase the feeding and sales value of the crop. But it is important that generous applications be made. Better to amply feed a small field than to half feed a larger.

Armour's BIG CROP High-Analysis Fertilizers are manufactured under the most careful scientific control. They are so made as to give a quick, vigorous, ample, early growth of stalk or vine while moisture conditions are good, and then carry the crop through a well-fed growth to an early maturity.

Make sure that your investment in fertilizer will bring the greatest possible returns. Armour dealers are prepared to help you in the selection of the most suitable BIG CROP Fertilizer analysis for your particular soils. You can command their services freely. If you do not know the name of your Armour dealer, write to us.

PENNSYLVANIA FARMER

(409) 25

A long beam put across rear of tractor with one disc at each end and the front of the beam does not work well, as front wheel of tractor side side-wise in turning.

Hitches For Three Discs Behind Tractor— D-635.

To Get the Most Out of Tractors

FUEL and oil are the most noticeable items of tractor cost, but in themselves are really of minor importance. Modern tractors are fairly economical in the use of fuel and oil. Nothing can be saved by stinting the quantity or lowering the quality of the cylinder oil.

Sometimes the fuel and oil used, as well as the cost of man labor, are too high per unit of work done because the tractor load is too light. Thus a two-row corn planter is a light two-horse load, and pulling this with a tractor intended to do as much as ten horses is not very efficient of fuel and especially of oil and man labor. On the other hand it doesn't pay to load a tractor to the point that serious wheel slippage occurs or the speed of travel is below that at which good work can be done.

To Reduce Upkeep and Lost Time—

A careful and efficient operator helps in making a tractor profitable by avoiding accidents and breakage. By greasing and changing oil at regular intervals, by tightening bearings and making other adjustments before damage results, and by doing such adjustments and overhauling at such times as will not conflict with its use when needed. He can also help much by adapting the tractor to more and more of the farm operations.

More Days Use per Year

Undoubtedly the best chance of cutting tractor costs and increasing the power buying income is by getting more use out of work per year, thus cutting down such overhead costs as interest, taxes, and a very considerable part of the depreciation.

This profit of more hours use per year depends very largely on the owner's ability as an agricultural engineer and farm manager, since it means the careful selection of the tractor to fit the farm's needs, the proper relation of the farm operations with tractor power, the engineering ability to devise hitches and other means for making the best use of the equipment at hand, and the ability to cooperate with his neighbors in the exchange of equipment and labor.

If a small farmer finds himself with a large size separator, he would be foolish to buy a large tractor to operate it only two or three days per year, since he could hardly afford to

buy the large plows and other equipment to go with such a tractor and he would have to spread his heavy interest and other overhead charges over two or three days' use, making these costs perhaps \$50 to \$75 per day.

I know of one farmer who uses his medium-sized tractor for all his farm work that he can, and at slack times hooks his tractor up to a pulverizer and grinds limestone for himself and neighbors. He also exchanges tractor work for man and team labor in getting rock to the pulverizer.

Where a farmer is buying new machines for use with a tractor, those implements intended for tractor use will usually be found most convenient and satisfactory; but where good ordinary implements are on hand and cannot be disposed of to advantage they will often give very satisfactory service by proper hitch arrangements such as those shown.

At the top of this page is a sketch illustrating two ways of hitching three discs behind one tractor. Such an arrangement may be a means of saving time in disking and making full use of the tractor's power. Two discs may be readily hitched to a tractor by following the suggestion illustrated in the sketch at the bottom of the page. I. W. D.

An Outside Chimney

IN reply to a request of J. W. Smith wanting information on the construction of an outside chimney, R. U. B. told Mr. Smith that outside chimneys were not satisfactory. I beg to say that they are if built right. You only have to tear out enough opening to make room for the arch and mantel then the balance of the chimney will be on the outside of the house.

As to chimney getting hot, it will not if properly constructed. The heat is all used in the fireplace, or the stove, as the case may be. Flue liners are not necessary if you lay your mortar joints well and plaster inside of flue.

Dig down below freezing point for foundation. You will not need to bolt the chimney to the house if you build it plumb. The single width of brick is all that is needed in flues. Also in the front and back of chimneys, but the sides must be thicker so one will have room to shoulder the chimney.

Money-Making Soil-Building Equipment

MANURING land pays big returns. So does liming. Now you can do both of these profitable operations with one machine—the New John Deere Spreader.

The New John Deere, the only spreader with the beater on the axle and box-roll turn (shown above), does a better job of spreading—easier, faster and cheaper.

The beater is on the axle, close to the ground, so the finely shredded manure and lime are not thrown high into the air—winds do not cause drifting.

The low-down box does away with high pitching—hard work in manure and lime spreading.

High drive wheels, tapered box, non-wrapping beaters and

The Story of Woodbine Farm

By W. D. ZINN

I DECLINED to consider their proposition. In a few months a committee came again, but received from me the same answer. In a short time they returned the third time and said, "Now, we know you would come and work for us if we would give you enough money." I told them I was human, and money would be an inducement, but what I would consider enough they would think out of all reason. "Name your price," the committee said.

After revolving it in my mind I said, "I will come for . . . dollars a year, if I may be permitted to come home every Saturday night, and return on Monday morning, provided you will pay all my expenses while I am away."

Of course I did not think they would accept such a proposition. The committee said, "We are not authorized to offer you quite so much, but we will call a meeting in the morning, and let you know then whether we will accept your proposition."

That night was a poor night for sleeping. I was provoked at myself because I had sold myself for the lousy lurch. Next morning my wife said, "What was the matter? You did not sleep much." Then I told her of my trouble. I do not believe that that man lives who loves his home more than I do.

An Opportunity for Service

For the last forty-five years my good wife has been encouraging me to look on the bright side and in keeping with her custom she said, "You should not feel that way about it. Harrison is one of the best counties of the state, and you will become acquainted with a lot of good people and your opportunity for doing good will be greater there than it would be here on the farm. You ought to be thankful that your services are wanted by such a class of people."

I met the committee on Saturday morning in its office in Clarksburg, still feeling that I had made a mistake. When I arose to speak before the committee I said, "I think this committee is making a mistake in hiring me at the salary you are to pay. With this salary you can hire two much younger men, either one of whom might do more and better work than I. Besides I want it understood now that I will only continue in the work one year, and it will be unfortunate to hire one who will stay on the job only one year. I will only get acquainted with the farmers in that time."

Mr. Arnold said, "You are wanting to back out, but you can't do it that way." The agreement was closed. On the following Monday morning I mounted one of the best saddle horses I ever owned and rode to Elk District of Harrison county.

Results of Survey

A survey had been made of the county which disclosed the fact that \$2,000,000 had gone out of the county the year before for hay and grain, and a great deal of this had been spent by farmers. The question of stopping this needless expenditure of money by farmers seemed to me to be the paramount question for the farmers to consider, for how could they build better roads and school houses and equip their homes with modern conveniences when they were spending so much money for feed?

Mr. Jackson Arnold, whom I visited the first week of my work in the county, said, "Mr. Zinn, I have paid out from \$500 to \$1,000 every year for the past twenty-five years for hay. If you can solve the wintering problem for me you will have done me the greatest possible amount of good."

On investigation I found that Mr.

Arnold had more than seven hundred acres of as good land as could be found in the state. Fully one hundred acres of this was tillable land. There were meadows here that he said had not been plowed for fifty or sixty years, and they were producing nothing but poverty grass.

His problem did not scare me, for I had solved the same kind of a problem on Woodbine Farm several years before. He had one of the best barns in the county, but it was poorly arranged for cattle. In fact it was built to accommodate horses, and he had been keeping less than a dozen cattle in it. The basement was enlarged, and he floor above was arranged for keeping cattle, the box stalls built for horses being taken out. It was soon so modified as to accommodate seventy-five large cattle.

A rotation of corn, rye or wheat for hay, clover and timothy was adopted. A silo 12x53 feet was built, and not a dollar was paid out for hay afterward. All over the county farmers were induced to put their permanent meadows into a short rotation. Within three years two hundred and eighty-eight silos were built. Lime was used to sweeten the sour soils.

Meetings at Court House

In order to get acquainted with the farmers of the county, I suggested to my Executive Committee the propriety of holding Saturday afternoon meetings at the Court House in Clarksburg. This town is very centrally located and it was a custom among the farmers of the county to take Saturday off for marketing and for the transaction of business.

This practice brought a great many farmers in town on Saturday. When the meetings were started it was not our intention to carry them on very long, but they grew in interest, and were more largely attended, and greater interest manifested in them during my fourth year as county agent than at any previous time. Farmers formed the habit of coming in every Saturday afternoon whether they had any questions to ask or not.

The meetings usually opened at one p. m. and it was after four o'clock when the farmers left the court room. The meetings were like moving picture shows. When the reel had been run, we simply started back and ran it over again. I mean by this we would discuss one question, and the querist would retire. A new farmer would come in and perhaps ask the same question.

I often stood on the floor three hours talking and answering questions all the time. It was hard work but I never did anything that was quite so pleasurable. I shall always regard the four years and three months I spent in Harrison county, W. Va., in the capacity of county agricultural agent as being the hardest work I ever did in my life, but they were also the most pleasant years of my life.

(To be continued.)

Rotten Manure

MR. S. Baker of Pennsylvania has something to say about rotten manure on page 335 of a recent issue. I hold a little different view of the matter from those he expresses. I can see why the gardener and the truck grower want well-rotted manure, but for the man engaged in general farming I see no reason why he should let the manure rot.

I have always tried to have all this coarse stuff rot in the ground. In the first place there will be less loss. When manure is rotting in the pile as Mr. Baker suggests more or less of the ammonia is lost by the heating. The decaying of vegetable matter in the soil will increase bacterial life there and we cannot have too many helpful bacteria in the soil. Again, the decay of this matter in the soil will help to render more plant food available and that is another thing we want to accomplish.

W. D. Z.

MAKE THIS CHART YOUR GUIDE

THE correct grades of Gargyle Mobiloil for engine lubrication of prominent passenger cars, motor trucks, and tractors are specified below. If your car is not listed here, see the complete Chart at your dealer's. Follow winter recommendations when temperatures from 32° F. (freezing) to 0° F. (zero) prevail. Below zero use Gargyle Mobiloil Arctic (except Ford, Models T, TT, use Gargyle Mobiloil "E").

GIVE REAL STUDY TO THE SELECTION OF FENCE

Today the successful farmer overlooks no detail that will enable him to profit through the scientific control of crops and stock. In this respect he finds fence of vital importance and gives real study to its selection.

Zinc Insulated Fences

Because countless farmers have given real study to the problem of selecting fence—more American Steel & Wire Company Zinc Insulated Fences are in use than any other make.

Quality alone has made them first choice—the fact that through years and years of hard service they have proved their superiority beyond all question of doubt.

Sturdily constructed of the finest material and heavily zinc insulated, they resist corrosion to the utmost. Easily erected over uneven ground and made in varying styles to meet every requirement.

Near you is one of our dealers. His store is Fence Headquarters and he will render every assistance in helping you select the type of fence that you need. He also carries either the Banner or Ideal U-Shape Steel Line Posts and the new National Expanding Anchor Dirt Set End and Corner Posts—the best foundation for the best fence.

Zinc Insulated Fences in the following brands: American, Royal, Anthony, Monitor, National, Prairie and U. S.

Mulch Paper

THE writer experimented with mulch paper last year in starting seedling plants and found that early in the season he gained about ten days time with tomatoes, cabbage and so forth mulched with paper over those without any mulch. Another interesting factor brought out in these trials was that the plants generally rooted closer to the surface of the ground, so that in digging for transplanting you have a better root system. Another advantage of paper mulching is that it holds the soil moisture close to the surface and so increases the germination of the seeds during a dry time and with a lot less care.

In summer work with mulch, pansy, cabbage and other seeds of such character when sown in plant beds during a period of excessive drouth gave a good stand with one good watering when sown, while those not mulched needed about five waterings to get them up. Again with cuttings in a limited trial, we thought there was increased percentage of rooting over those not mulched on account of the increased temperature of soil under the paper acting as a mild bottom heat. For such purposes there is a practical field for the use of this material and we think it well worth the time of anybody interested in making trials.

Staples Hold in Place

While we had success in the garden in promoting the growth of peppers, eggplants and tomatoes as well as cabbage and lettuce early in the season, the expense was greater than that of cultivation.

One of the difficulties in using mulch paper is to hold it in place and to keep the wind from blowing it all over. The most satisfactory method we found was by the use of wire staples made of about No. 10 wire with at least eight or nine inches of each side in the soil. If we did not make the legs as long as this, a strong wind would pull a number of the staples up, especially early in the spring when the heavy winds in New Jersey.

In summarizing, we feel that the paper will have a place for certain special purposes in agriculture and gardening, but is rather expensive for general use.

C. A. McLean,
Mercer Co., N. J. County Agent.

"He Who Plants a Tree"

WE live at the foot of the Blue Ridge Mountain on the south side and here we had lots of timber until quite recently. For a few years a man has been buying one tract after another for mine props. It is remarkable how fast our timber goes to the mines. I never imagined that so much timber would go into the mines.

This man has two tractor trucks and hauls 15 tons on a load and two loads a day. When he is done with a tract of timber there is not a sign of a growing tree, as he slashes everything down. I would not be surprised if the state would pass a law forbidding this "murdering" of the little trees which have no present value but a promising future. It hurts me to see it being done that way.

Of late years I have been planting my poor land to trees which the state furnished as seedlings. My first venture in this line was about 15 years ago when I bought 400 seedlings of catalpas from a man in Illinois who advertised his goods so much that people bought before they knew their value. That tree may be all right for Illinois, but it is too slow in Pennsylvania. I planted the catalpas in rows four feet apart each way and cultivated like corn. I gave them the best of care and about every one grew. Had I planted something like black

Quality Preferred

WHEN you go into town on Saturday for the week's buying, how do you go about it? The chances are that your mind is pretty well made-up—not only as to general description of the products you want, but as to the brand names. You'll mention familiar merchandise easily, naturally. Names of advertised goods.

You prefer advertised goods because you know you can depend on them. You save hours of shopping time in a year because you don't need to investigate or examine the things you want. You don't buy on suspicion—you buy with confidence—because you know goods that are consistently advertised must maintain consistent quality. It is ruinous for a manufacturer to turn the spotlight of advertising on an inferior product. And advertisers know it. Hence advertising is a guarantee of dependability.

Read the advertisements regularly. When you go to buy—be informed!

YOU CAN BE SURE THE QUALITY IS "AS REPRESENTED" WHEN YOU BUY ADVERTISED GOODS.

or yellow poplar I would have about three times as much of a tree as I have now.

Eight years ago I planted white pine and Scotch pine and today they are eight to twelve feet high. I am not so much in favor of planting white pine any more because the blight attacks it. Scotch pine is hardy in every respect and is a fast grower.

This year I have ordered red pine, Austrian pine, Norway spruce and black locust. The locusts will take the place of the doomed chestnut for fence posts.

Two years ago I planted willows in marshy meadow which was always hard to mow because it was too wet. Ever since I knew anything about meadow it has been mowed for hay. For a long time I realized that I did not pay to make hay there, but I let it go without mowing it would grow up to weeds which would be an annoyance, and then the idea struck me of starting willows.

To plant willows is very easy. With pointed iron make a hole and put a willow stick. It will grow. I have also raised black walnut trees from seed, but they are somewhat slow growers.

Would it not be a grand idea to plant a field to sugar maples for the coming generation to make maple syrup? We have to provide for the next generation if they are to have trees. Forests are valuable in very many ways. First for their products of wood and lumber, for flood control, for game preserves, for windbreaks. What is nicer than nice growing forest trees? C. R. Bashore, Berks county, Pa.

Deserted Churches

MUCH is being said and written about deserted churches, especially deserted country churches, and when we see them standing stark and bare of suitable surroundings we think, "No wonder that they are deserted."

Beautiful surroundings—never before in our land has beauty received so much emphasis. Landscape gardeners, interior decorators, pages of advice about decorating the home, they not plans for beautifying the country church? God made the flower house? That is a tithe that we are prone to forget. When the perennials are divided in the home garden, they not carry a few to the churchyard?

Nothing succeeds like success. The church may be in a thrifty condition. Why not say it with flowers? If flowers may attract the folks who are able to help make it thrifty.

Create Interest

It is not necessary to hire a landscape gardener. In every community there is some one with "garden sense." An unbroken bit of lawn, shrubbery close to the foundation walls, roses, phlox bordering these, and so that there will be a bit of green against the green throughout the frost-free season, will make the grounds into a delightful spot. The most beautiful church I ever saw is a stone church in the country. The approach to it small stone trees flaunt swaying pennants of green in summer, russet and gold and crimson in autumn.

Often our church is decorated with ferns or with flowers when a general is to be held there. I am getting to associate certain flowers with church. This should never happen. Flowers are glad to be in the arms of little children, carry them to shut-ins and the very enjoy them on gala occasions when they while living in this good world.

To return activity around the church creates interest. To be successful it must be a "going concern." Curiosity helps. We have Egg Week, Old Home Week, etc. Why not a Beautiful Your Church Week? Let's go! M. C. S.

THE YOUNG PEOPLE

Kite Time

CORRECT proportions and balance combined with lightness and strength are the requirements of a kite that will fly. Any boy with a sharp knife, a plane, some sandpaper and plenty of patience can build such a kite.

To begin select two pieces of straight-grained light wood, such as white pine or spruce. Cut them 30 inches long—both the same length. Plane them down to a quarter of an inch in thickness, making them square with the edges rounded slightly. Care should be taken to have these sticks straight and uniform in thickness their entire length when finished.

To Make Kite Balance

A small notch is now cut in each end of both sticks, about a quarter of an inch from the end. This is to tie the strings to which hold the paper. Next find the exact center of one stick, by measuring from both ends, and mark this center with a sharp pencil. Place the stick on a knife blade at this pencil mark and see if it balances. If one half is a little heavier than the other sandpaper that half down until both halves are of the same weight and the stick balances.

Six inches from one end of the other stick make a similar mark with the sharp pencil. Now turn the sticks half over and mortise a place so that the pencil mark comes at the exact center of the cut. Make the mortise just big enough so that the two sticks will fit together tight and at right

Any Boy Can Make a Kite

that it can be cut about an inch larger than the outline of the kite all the way around. With bow or front side of kite on the paper, fold paper neatly to fit string and paste the folds down all the way around, thus holding the paper to the kite. The paper should not be stretched too tight. It will do no harm to put a little paste on the sticks where they come in contact with the paper to hold the latter to them.

A string is now fastened at "E" and "D." It should be the length of the line "E" "C" "D," and the kite string is attached to it at a point corresponding to "C." Now hold the kite up by this string and note if it balances. If not, it can be made to balance by pasting strips of paper at "A" or "C."

This kite needs no tail and flies best in a light steady breeze. If the wind is too strong and it shows a tendency to dive it can be steadied by a tail. If made right it will require two balls of kite string, or more, for it is a high flier.

Dimensions for Box Kite

This box kite is made in the proportions of one, two and three. That is, it is one foot deep, two feet wide and three feet long, or any size in like proportion. The points "O" and "M" are half way between "D" "G" and "C" "F," respectively, while "Y" is half way between "D" and "C," and "X" is half way between "C" and "M."

The sides and back are covered with paper, which is pasted to the sticks which form the frame. The space "C" "D" "Y" "X" is likewise covered, as is "M" "O" "G" "F," but the space "X" "Y" "O" "M" is left open. Both ends of the box are also left open.

The string is fastened to the loop "S" which is tied to the kite at "Y" and "X." The kite is braced at each end by strong cord tied "AD" and "CB."

Four-H Doings in England

THE international dairy-judging contest which is held each year in England will take place this year at the Royal Show, Manchester, England, July 8 to 12. It will be remembered that the team from Oklahoma, representing the United States, competing against a team from the Young Farmers' Clubs of England, brought home the honors.

An Oklahoma team will represent this country again this year, having won the right to do so by successfully winning a competition among teams from twenty-seven states at the National Dairy Show last fall. It is considered likely that a team from Canada will also compete in the contest this year.

Figure them Out

THE following are your close relatives. Who are they? This is a complicated puzzle, we admit. A gold pencil will be sent to the first one sending the correct answers before March 22. Send your letter to Puzzle

Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

1. Your father's uncle's brother's sister?
2. Your aunt's mother's father's wife?
3. Your mother's nephew's daughter's son?
4. Your brother's son's sister's mother?
5. Your sister-in-law's father-in-law's grandson?
6. Your sister's father's stepson's mother?
7. Your uncle's father's only granddaughter?
8. Your brother-in-law's wife's grandmother's husband.

Answers next week.

GIRLS' NAMES CONTEST

Again Richard Stear of Pennsylvania has furnished us with an interesting puzzle. Find the names given in the list below; hurry your answers to Puzzle Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa., and perhaps win the prize of a book which will be sent to the one sending the correct answers, accompanied by an interesting letter on any subject.

1. A prominent Easter flower.
2. A time for violets.
3. A woman's shoulder cape (or a name for a collar).
4. A jewel.
5. What Dad sometimes does with baby.
6. How to write a postscript.
7. First steps in music.
8. A great virtue.
9. An article.
10. The night before.
11. A spinning machine.
12. What a scissors grinder and a locomotive have in common.
13. Two consecutive letters of the alphabet in transposed order.
14. What would an army do if they found a river too deep to ford?
15. A fine quality for a woman to possess.

Answers and winners next week.

Fond of Music

"I SEE by the paper they are going to have a chaperon at the dance tonight," giggled Miss Nino Clock. "Won't that be heavenly? I've always wanted to hear one and I'm getting so tired of saxophones."

Farm and Dairy

By L. W. LIGHTY

Thousands of feeders have found that Larro is the one feed that makes a "ringer every time" in profit over feed cost.

Dairymen who feed Larro sometimes try cheaper feeds hoping for good results. They may get good results temporarily—but when milk production starts falling—when the cows go off-feed—constipation or udder trouble set in, they quickly come back to Larro.

They know that Larro keeps their cows in the pink of health and condition—and that it gives them the highest profit over feed cost.

T. J. Grace & Son, Rutland, Vermont, say:

"Have used Larro seven years. Fully convinced it made more profit for us than any other feed we could have used... Have tried other rationals but always come back to Larro. Our herd has been free from udder trouble and off feed condition... We attribute this to your safe and uniform feed."

The exact balance of ingredients required to produce the highest profit over feed cost has been proved by years of tests at the Larro Research Farm... at the Larro Mill that balance of ingredients is accurately maintained by an exclusive Larro process... Each bag of Larro is uniform in analysis, texture and feeding value.

Try Larro and you will know why it gets a "ringer every time". Your Larro dealer keeps a fresh supply on hand.

I HAVE a letter from a middle-aged man presenting a phase of life that is enacted frequently. He says, "I had a pretty good farm half paid for, but the very high wages induced me to sell about a dozen years ago, move to town and buy a home which I did not quite half pay for. In the public works I got the high wages. Desiring to live on the higher plane we heard so much about, the debt on the home was not reduced."

"Two years ago things were not so brisk and I could barely hold my own. Another year of it and I will have no home nor any way of making a living."

"On the farm I never failed to have a living and almost every year I made a small payment on my indebtedness. Had I stayed on the farm it would now be paid for and I would be assured of a home and a living. What a fool I was. Only one poor consolation, there are many others."

It strikes me that this is a fair portrayal of the condition of a goodly number of folks right now. Our lot on the farm is often far from ideal, but I have knowledge of very few people on the farm who are not making a living, but hundreds are making application to the charitable organizations for help in our city. I was told lately by one who knows that there has not been such a demand for help by the hungry and badly clothed for twenty years as now in our home city.

This winter plenty of men were glad to work for the farmers for a dollar a day and three square meals, because it seemed on the farm was the only place where three square meals could be had.

They Would Make Cheese Instead of Butter

"Butter is a drug in our market and cheese is not to be had. Would it be a good plan to turn the milk into cheese instead of butter?" This from one inquirer. Another puts it in different words, but it is the same question.

Every one knows my motto is to perfect yourself on a specialty and stick to your last. Yet there is a time for everything and when a change is necessary it should be made in a whole-souled and determined way. Our best should be given to the new course adopted.

This low butter price may be temporary. A great quantity of butter in storage is being moved and a great many people are short on work and money, hence the accumulation and drop in price. But it is entirely possible that these things are not temporary.

I realize the truth of what the inquirer says about cheese not being generally offered. Cheese is rarely kept except in the larger cities, and there I have to make an effort to get good cheese.

A few years back I told the story of F. W. Shank of Ohio who by cheese making on the farm paid for an excellent Richland county farm and another large one in Alabama. His customers still carry the cheese from his place as rapidly as he can make and cure it.

Comparative Prices and Quantity

Usually the price of butter per pound is not quite twice the price of Cheddar or brick cheese. Just now the price of the best butter in the chain stores is 45c and the price of cheese is 32c per pound. Roughly speaking the milk that makes one pound of butter will make two pounds of cheese, but a good cheese maker will do some better.

Cheese is a most excellent food and doubtless hundreds of tons of milk that is not wanted now as milk, cream or butter should be turned into cheese and marketed so consumers could get it and enjoy it, but at the same time

I want to warn the inquirers that cheese-maker has no soft snap. Cheese making is as fine an art as is butter making and you have a lot to learn before you will make a class article.

Good equipment is necessary and that requires quite a little outlay cash. Remember you have to make cheese every day for 365 days in year. You make butter three or most four times a week. This is serious consideration.

Then you must have a good room for the cheese, because if it is not well cured it is a very poor article of food.

Feed for Bulls

Will you inform me what you feed or what you think is best to feed bulls kept for more than two years? They put on flesh and still not get desperate? Some gentleman told me you have bulls four to five years old and I half doubted this statement. I have a bull nearly two years old and would like to keep him over this summer yet, so I would be exceedingly glad to be informed of your experience in this case. A. J. Meyer

EVERY bull we are using at College today is over six years of age. We got them all as old as we like to use a herd sire and daughters we can see and determine whether they are right from standpoint of type and whether they are good producers. We have seen bulls that are from 10 to 14 years of age and are in good breeding condition.

One of the important things to a bull in good breeding condition to give him plenty of exercise. Have a bull exerciser, sort of a m-go-round, to which we tie six bulls one time and drive them around an hour or two every day.

The ration for the bulls is as follows: 150 lbs. barley, 150 lbs. meal, 200 lbs. oats, 100 lbs. distillers grains, 50 lbs. linseed oilmeal, 50 soy-bean meal, 50 lbs. peanut meal. We feed the bulls from four to five pounds of the foregoing mixture in addition to eight pounds of clover and timothy hay and 15 pounds of corn silage. A. A. Bock

C. T. A. Report

Laurel Hill

THE Laurel Hill Cow-Testing Association of Bradford County, Pennsylvania, finished its 15th December 1, 1929, with 16 whole members and one part-year member. The total number of cows for year was 450. The results of the association for the fifteen years are as follows:

| Year | Lbs. Milk |
|-----------|-----------|
| 1913-1914 | 6115 |
| 1914-1915 | 6572 |
| 1915-1916 | 6680 |
| 1916-1917 | 6908 |
| 1917-1918 | 6905 |
| 1918-1919 | 6989 |
| 1919-1920 | 6989 |
| 1920-1921 | 6544 |
| 1921-1922 | 6439 |
| 1922-1923 | 7270 |
| 1923-1924 | 7170 |
| 1924-1925 | 6874 |
| 1925-1926 | 7581 |
| 1926-1927 | 7517 |
| 1927-1928 | 7381 |
| 1928-1929 | 7720 |

Eleven herds with an average five cows or more exceeded an age of 300 pounds of butterfat. Complete list follows:

| Owner | Breed | Milk |
|-----------------|---------|--------|
| C. S. Chaffee | R.H. | 11,500 |

Everything that a Silo can have—plus SAFETY

That's the Unadilla—the most popular silo made! Here is a real tower of strength! Great, strong, steel cables imbedded in concrete hold the Unadilla erect, steady and firm on its foundation. So easy to erect that a handy man and a boy can do it easily and quickly.

Easy and safe to climb as walking upstairs for the patented door fasteners form a convenient, permanent ladder of wide, low, safe rungs directly under the openings. The doors open automatically when the fasteners are raised. They do not freeze in or stick, yet are water tight and frost repelling.

The most famous dairy farms use Unadilla! Why not you? Send for free, big, illustrated catalog today; also prices, terms, etc. Real discounts for cash and early order. Don't wait—get in line for a Unadilla now and settle your silo problem for good!

Radio Program

A GROUP of familiar friends of the National Farm and Home Hour radio audience will deliver the Department of Agriculture periods of this daily program during the week beginning Monday, March 17. Every speaker for the Department has frequently addressed the Farm and Home Hour folks between 11:45 and 12:30 p. m., Central Standard time, through NEC stations.

Features for the week aside from the regular monthly reports and commodity reviews and the weekly features of the hour are a talk on "Forestry and Erosion," by H. N. Wheeler, forest lecturer, and a discussion of the "Early Vegetable Situation," by W. A. Sherman, in charge of the fruits and vegetables division of the Bureau of Agricultural Economics.

Fruit and vegetable growers who are framing their plans for the spring also will be keenly interested in the Farm Board's period this week, for they will hear Mr. K. B. Gardner, in charge of the fruits and vegetables section of the Board's division of co-operative marketing of fruits and vegetables in 1930.

The complete program for the week follows:

Monday, March 17

The Feeder Sheep Situation.—C. L. Harlan, livestock statistician.

The Price Situation.—Dr. O. C. Stine, in charge of statistical research.

Tuesday, March 18

The Garden Calendar.—W. R. Beattie, horticulturist.

Forestry and Erosion.—H. N. Wheeler, forest lecturer.

Thursday, March 20

The Farm Business Library.—M. S. Eisenhower, director of information.

The Early Vegetable Situation.—W. A. Sherman, in charge fruits and vegetable division, Bureau of Agricultural Economics.

Friday, March 21

Cooking the Spring Vegetables.—Fanny Walker Yeatman, foods specialist.

The Week With the Farm Board.—Edgar Markham, assistant to the chairman, Federal Farm Board.

Cooperative Fruit and Vegetable Marketing in 1930.—G. B. Gardner, fruits and vegetables marketing specialist, Federal Farm Board.

Study of Ox Warbles

VETERINARIANS and leaders in the livestock and dairy industries are reminded that the Bureau of Entomology, U. S. Department of Agriculture, published about four years ago, Department Bulletin 1369-D, "The Cattle Grubs or Ox Warbles, Their Biologies and Suggestions for Control," which treats in detail of the studies and experiments by the Bureau dealing with this pest.

A small stock of this bulletin is still available for distribution to those who desire somewhat fuller information than is provided in the more recent popular-style, Farmers' Bulletin 1596-F, "Cattle Grubs or Ox Warbles with Suggestions for Their Control," which is also obtainable on application to the Office of Information, U. S. Department of Agriculture.

This De Laval Milked Herd Leads in Pennsylvania

THIS herd, owned by Mr. H. A. Snyder, Montoursville, Pa., was the first herd in the Pennsylvania cow testing associations to have an average of 526.4 lbs. of fat and 14,293 lbs. of milk. It was also the first herd to be above the 500-lb. fat average for two successive years. It has led the White Deer Valley Cow Testing Association for three successive years.

Mr. Snyder uses the De Laval Magnetic Milker and he writes: "Before installing the De Laval Magnetic Milker I made a careful investigation of several different types of milking machines. I believe that I made a wise choice, for the results obtained with the De Laval Magnetic have been very satisfactory."

Mr. Snyder is but one of the hundreds of dairymen in Pennsylvania who have found De Laval Milkers to be the better way of milking.

Write for complete information.

YOUR PROFITS ARE IN DANGER

ABORTION
One out of every five cows reacts to this terrible disease... each "aborter" costs you at least \$100. B-K kills abortion germs. The application of B-K by spraying and as a vaginal douche helps prevent the spread of this disease.

SCOURS
For relief use the B-K Treatment. To help prevent scours follow the B-K plan of sanitation.

B-K is 10 times more powerful than carbolic acid as a germ killer... Avoid losses from contagious diseases by prompt efficient treatment. A valuable 68-page illustrated book discussing these diseases, their causes, prevention and control, will be sent on request.

GENERAL LABORATORIES, Inc.
315 Dickinson Street, Madison, Wisconsin

Read the advertisements for devices which will help you with the household chores that you dislike most.

Spring time is tonic time

After the rigors of winter your cows should be given a tonic to tone up the system and stimulate the appetite. They have been without green feed for a long time, and a tonic will help them in shape for the heavy work ahead. Remember! A few cents invested now will return a hundred-fold later on. Use—

Dr. LeGear's Stock Powders

Contains mineral and vegetable ingredients scientifically compounded to produce an effective tonic, appetizer, conditioner and regulator for cows and other farm animals.

Free Book **Dr. LeGear Offers Guaranteed Results**

This coupon good for a free book. Get from your dealer enough of Dr. LeGear's Stock Powders to make a sixty-day test. Mixture with any feed. If not satisfied with results at end of sixty-day trial, your dealer will cheerfully refund every cent on dairy cows, horses, hogs, sheep and poultry. (Usual price 50c). Take coupon to your local dealer. If he does not have book, send coupon with 10c to pay postage and mailing to Dr. L. D. LeGear, V.S., 4114 Beck Ave., St. Louis, Mo.

Dr. L. D. LeGear, V.S., Graduate Ontario Veterinary College, 1892. Thirty-eight years of veterinary practice. Eminent authority on diseases of poultry and stock. Nationally known poultry expert and breeder. Noted author and lecturer.

Ten Days of June in February

(Continued from page 5.)

We had dinner that evening and musical entertainment on the roof garden of the Hillsboro Hotel in Tampa. There were special rooms where we could refresh ourselves before going exploring or turning in early. Next morning a great cigar factory; a ride along beautiful Tampa Bay and across the Gandy Bridge to St. Petersburg, the Sunshine City where the newspaper gives away its whole edition every day the sun doesn't shine. The city is famous for its world championship horseshoe pitching contests. Two champions gave a demonstration match for us. They were too good. Why watch when you know the next one will be a ringer? They should have missed once in a while to break the monotony, or else let some of us pitch against them to prove it isn't as easy as it looks.

Back at Tampa Mayor McKay dined with us and promised us a much better time if we would come back next year. We hadn't given him enough warning this time. Mr. Scott, sales manager of the Florida Citrus Exchange, brought us greetings from his great organization.

South of Tampa is great Manatee county, one of the first in Florida in its output of winter vegetables and a great producer of citrus fruits as well. Bradenton's business men under Chairman Lathrop turned out in force on our arrival there. They took us out to their beautiful country club, gave us a royal banquet of Manatee county products and a feast of facts about the greatness of Florida in general and the land of Manatee in particular.

Next morning they met us again and backed up the facts by showing us their rich farms and groves, their beautiful homes and hard-to-leave bathing beaches on the blue Gulf of Mexico. They are mighty proud of their farms and especially of one of their dairy farms Mr. Frobock's Inspiration Ranch on Palma Sola Bay. It has the only pure-bred Guernsey herd in Florida.

At noon they turned us over to the Sarasota Chamber of Commerce, the eighty-year-old father of whose president, Mr. Smith, says he would rather pick roses in Florida these winter days than iceleaves off the pump back where he came from.

A Feast of Celery

Another unforgettable automobile trip and a splendid view of the rich black soil of Palmer Farms. It produces hundreds of carloads of the crisp celery we sampled at the packing and pre-cooling plant. For once in our lives some of us had all the celery we wanted—rather, all we could eat—for the plant was started on a holiday for our special benefit and we could pick off the conveyor chains as many of the clean white bunches as we wanted to carry away.

From the celery farm to the circus the winter quarters of the great Ringling Brothers-Barnum-Bailey Circus. Mr. Ringling himself opened the gates to us. It was a great opportunity to see the animals and their off-stage tricks and to get acquainted with the lion tainers, the elephant trainers and the tight-rope walkers.

Having seen some of north Florida, central Florida, and the West Coast region, we set out for the famous East Coast, playground of the nation's millionaires and some common folks, too. On an automobile tour around Palm Beach and West Palm Beach, we saw the magnificent homes, clubs, hotels, yachts and boulevards that have made "Palm Beach" a synonym for great wealth.

Then our Chamber of Commerce hosts struck out for the west and in a few minutes we had left civilization behind. We were bound for the Everglades. Miles of cypress swamp. Trees were bare, for this is winter in Florida, too, even if it is warm as our June. Clumps of green in the tree

tops—orchids we were told. Past a great dairy, Loxahatchee Farm, whose success proves the possibilities of this country. I had the good fortune to ride with the man who developed this farm, Mr. Nielson, now president of the West Palm Beach Chamber of Commerce. When he started there was no road through this country. He traveled by speed boat on a drainage canal, as do many of the inhabitants of the Everglades to this day.

The growth of small trees gave way to a level growth of tropical grasses stretching away to the horizon and we were in the Everglades. The broad highway was built on the earth dug out of the drainage ditch which ran parallel. The long level miles weren't monotonous for we were occupied watching for alligators and for the strange birds we see in our zoos back north. There was an occasional pumping station to lift the water from one canal to a higher one. Thus is the water level lowered so vegetables and sugar cane can be grown on that black soil.

Fifty Miles to a Telephone

It's lonely country. The week before Mr. Nielson had been out hunting. His car broke down and he had to walk some 50 miles for help.

Lake Okeechobee came into view flanked by great cane fields. Land at Clewiston, a civilized spot resulting from the operations of the Southern Sugar Company. Although it has been shut down for its weekly cleanup, the Clewiston sugar mill was put into operation for us. Long train loads of cane stood on the tracks waiting their turn; this immense plant can crush 4,000 tons of cane a day producing over 400 tons of raw sugar, 400 tons of fiber and 25,000 gallons of molasses.

Back in West Palm Beach M. S. Dowell, Director of Agriculture Extension in Pennsylvania, saw us. It was good to see him and Mrs. M. Dowell, seeking and finding health and rest in Florida while on sabbatical leave.

Morning saw us farther down the coast at that magic city, Miami. We toured its water-front drives, its made islands with their palatial homes, its boom suburb with the hundreds of unoccupied houses. The boom was a bubble and it burst. All of Florida suffered the same way. Now sanity reigns again and most of the state is moving forward on a sound basis. The boom left many valuable public improvements; and course the bursting of the bubble didn't change that health giving climate. At the personal invitation of its owner whom we met first in Jacksonville, we made a short stop at the residence of J. C. Penney, who was famed recently as the temporary residence of President Hoover.

The big event at Miami was an embarkation on the Steamship Eufrasia for the over-night trip to Cuba. Mr. Johnston of the Clyde Line gave us a good welcome and Mr. Harms and Mr. Harms, Purser and Cook, Steward of the Eufrasia, made us feel at home on the boat. A guide guided us down the narrow passages to the open sea. Scores of pleasure and fishing crafts were coming and going for the night—flashing speed boats or more prosaic crafts that chug along in leisurely fashion, their owners waving a friendly salute.

As we swung out into the Gulf Stream we settled in our chairs to watch the sun set behind the Florida Keys. Then dinner in the spacious dining room, long walk around the ship, a visit to the "races" on the after-deck, or an easy chair inside to listen to the orchestra and watch the dancers. The water was smooth; of course, there was a ground swell which drove some of their steamers. But only a few were affected. (Cont'd next week)

COMMON PICK YOUR PRIZE!

BOYS/GIRLS

FIVE PRESENTS SURE TO BE YOURS! For selling only 20 packets of "Garden-Spot" seeds at 10c each. **MONEY TO PAY**, excepting on special value Stamp-Watch offer. Everybody plants "Garden-Spot" seeds. Beautiful colored packets filled with living seeds guaranteed to grow. Known with favor for more than 20 years from Maine to Mexico. Lots of people will take five to ten or more packets. Your own family and a few friends will buy all of them. You can sell out in no time.

HERE'S WHAT YOU GET FOR SELLING ONLY 20 PACKETS. One big premium, your selection; one extra present (a moving picture show); one prize package premium; and an equal chance to win part or all of \$1500 in Cash Prizes.

EXTRA. We send along at once one package of \$1000 Prize Garden-Wonder, \$100 Prize Oriental Mystery Flowers, catalogue of many presents, sample entry tickets, form. **SEND NO MONEY NOW—WE TRUST YOU.**

GET THIS EXPO CAMERA FREE. Win part of all of \$1000 in Cash Prizes given by us for the best picture sent in of vegetables, flowers, garden, yard, or home. Four prizes of \$25 each. Send in as many pictures as you like and you have an equal chance.

Expo Camera—a new, easy to use, 3 1/2 inch picture camera. Light, compact, easy to operate; will give you lasting pleasure for years to come.

Send no money—just name and address. We trust you with 20 packets of "Garden-Spot" seeds to sell at 10c a packet. When sold, send \$2 collected and camera.

With These Drills farmers get bigger yields

McCORMICK-DEERING

EAST, west, north, south . . . everywhere, farmers are getting bigger yields with McCormick-Deering Grain Drills. These men know from actual experience that the first step toward a bigger yield is the use of a McCormick-Deering Grain Drill at seeding time.

Fifty years' of successful grain drill manufacture is your assurance of the most satisfactory performance in your fields. The McCormick-Deering dealer in your town will recommend the drill for your farm, and will show you good mechanical reasons why it is the drill on which you can always depend. Types and sizes to suit any seed, method, soil, or farm are available. Send for our illustrated Grain Drill Booklet A-540-S.

Business Letter

DULL business and unemployment are believed to have hurt the hog market this week. The tone was weak, with some recovery at the close. Marketing of hogs was very light, yet the average price here dropped to \$10.55, from \$10.80 last week. A year ago the average was \$11.45.

Eleven markets had only 498,000 hogs this week, lightest for the week in many years, and comparing with 625,000 last week, 520,000 the same week last year and 709,000 two years ago.

Hog Futures

Trading has been light during the first week of the hog futures market. Whether there will be enough trading eventually to make a real market is still uncertain. So far there has been no farmer trade and very little packer trade.

The following price ranges for the week will give some idea of future price expectations: March light hogs, \$10.85 to \$11.25; April light hogs, \$11.25 to \$11.65; May light hogs, \$11.35 to \$11.75; September light hogs, \$11.40 to \$12. April medium hogs, \$10.50 to \$11. March heavy hogs, \$9.95 to \$10.20; April heavy hogs, \$10.00 to \$10.20; May heavy hogs, \$10.

Light Cattle Supply

The cattle market had a pretty good tone all week up to Friday when with a light supply butcher stock declined again.

Best steers sold this week at \$15, with ten head of fancy yearlings at \$15.75. In the main steers sold higher this week than last, with the average at \$12.55 showing a 30 cent gain over last week. A year ago the average was \$12.35 and two years ago \$13.10. But it took a very light supply, here and at other leading points, to hold the market up. Scarcity of weighty finished steers helps to hold the top of the market high.

Many Lambs to Come

Lambs gained a little this week, for a change. The market at the close showed an advance of 10 to 50 cents, but the average price of lambs at \$10.45 was the same as last week, and \$6.25 under a year ago. Federal steers still suffering heavy losses. Top lambs this week brought \$11.35.

It is estimated that there were 1,640,000 lambs left in the feed lots of the northern Colorado, Arkansas valley and Scottsbluff sections of Nebraska on March 1st compared with 1,210,000 on the same date last year and 1,005,000 two years ago. The western feeders have been holding back, with the marketing of native lambs accounting for the increase in the year to date.

Farm Board a Trade Factor

Speculation in wheat these days is based more on what the Farm Board will do than on supply and demand conditions. When prices sag for a day or two it is known that the Board will either do some talking or some buying to put prices back up, and this has become a trading factor of the first rank. How much it has made for shrewd speculators nobody knows. Wheat prices crashed early in the week and the following announcement was immediately forthcoming from the board:

"The Grain Stabilization Corporation will continue buying wheat at the market and remove whatever additional quantity that may be necessary to relieve the pressure and prevent any considerable decline in wheat prices. The Farm Board is prepared to advance to this farmers' organization whatever funds are necessary for that purpose."

The Stabilization Corporation is being accused of speculating in the grain market. There is no foundation in fact for this statement. The stabilization corporation is prepared and expects to take delivery of all grain purchased on futures contracts and merchandise it as the market conditions will permit.

This had a pronounced effect on the market, and advances put closing prices about where they were before the Monday break. The statement was interpreted as meaning that unlimited funds will be available for the stabilization corporation.

In Canada

The governments of the three western Canadian prairie provinces are completing legislation this week to guarantee banks against losses on money loaned to the Canadian pools.

Chicago, March 8, 1930 Watson

Save 50% of Your Time

Cut the time you spend in orchards 50% and better work.

That's exactly what fruit growers are doing with the Clark "Cultivator" Bush & Bay Pine Harrow.

For this implement does both the work of mold-board plow and disk harrow in one operation. And does it better—in half the time.

The Bush & Bay Plow and Harrow plows and disks the soil—turns over weeds and weeds down—mutilates the soil.

It's nothing new, but in the orchard it does many jobs that would wreck ordinary tools.

It's just the implement—the only implement working hard-baked soil, stubble land, and drained bays and swamps, Leach land, custom land—no touch job.

The Bush & Bay Plow and Harrow is found in every disk of every steel, but there's no sharp. They're unconditionally guaranteed for 3 years against cracking or breaking.

Clip coupon for FREE catalog of tillage which includes other time-saving implements fruit growers. Valuable book. "The Soil and Tillage" also sent FREE.

Tickling Pigs' Appetites

HOGS do well for us in a wood lot. They work around rotting logs and decaying stumps and seem to get what a hog needs in the way of tonic. Every now and then we burn a brush heap for them and when we pass the spot a few days later the ground is bare, every remains of the fire cleaned up—eaten. There is something clean and fresh about the ground in a woods, something that keeps a hog's appetite strong and active.

By studying these hog preferences and hog thrifths based on woods life we have come to apply them wherever we keep hogs. We want to winter our hogs on a sod field that is due to be plowed in the spring. This gives a clean place to feed each time. Even if the ground is soft, one feed in a spot is satisfactory regardless of mud—clean and sweet mud is ever so much more preferable than a spot reeking with hog manure and urine. We anticipate soft spells and scatter areas of straw on which to feed the corn.

We do not bother our heads trying to understand why a hog eats coal slack, but we always have a load of soft coal screenings for our hogs to work at whenever they want it. We char wagon-loads of corn cobs every year for our hogs, both winter and summer. We rake them into piles and set them afire—when all aglow we quench with water and the hogs are already waiting around the pile to take care of this excellent mineral and appetizer.

Vinegar and Pumpkin Seeds

The human race eats carloads of ketchup and tank-cars of vinegar every year, appetizers and real digestive alternatives. Long ago we took to giving fattening hogs a dash of cider vinegar in their slop two or three times a week; our sows on heavy rations sucking their pigs always get vinegar, half a glassful two or three times a week.

It is folly and carelessness to throw the house ashes over the back fence when hogs are hungry for it, ready to pay a good price for it in thrif. Whether the ashes are from wood or from coal makes no difference in our disposal of it—it goes to the hog lot (dry of course). There is no feeding value to speak of in apples, but our hogs get the apples as a general invigorator whenever there are apples going to waste. Fall pigs are voracious at devouring pumpkin seeds while the sows eat the pumpkins.

The hog will pay a man well for doing this kind of all-around thinking for him, whereas when shut up on a balanced ration of corn and tankage he may hanker for the dear and blessed things in the outside world that he can't get to!

Bulletin on Lambs

FARMERS who raise sheep for the sale of lambs will be interested in Farmers' Bulletin 1134-F, "Castrating and Docking Lambs," which may be obtained free from the U. S. Department of Agriculture, Washington, D. C.

This bulletin emphasizes the value of docking all lambs and castrating the ram lambs which are to be marketed, in order to get maximum gains and good prices when finished. Undocked ram lambs are often discriminated against, the bulletin shows, to an extent ranging from \$2 to \$5 per hundred pounds, in comparison with castrated and docked lambs of the same age. This is due largely to the greater uniformity and more attractive appearance which castrated and docked lambs present when marketed.

Owners of range flocks have long appreciated the value of castrating and docking, but these practices are not so general in the case of farm flocks. The bulletin describes and illustrates the operations of castrating and docking to aid farmers in performing the work safely and effectively.

More milk money

from the same
cows—with
the same feed

10%
MORE MILK
Doubles profits

In the average dairy net profits can actually be doubled by increasing the milk yield only 10%. After the cost of "feed and keep" are met, every quart of milk is clear profit. A sensible drive for more milk is worth your effort.

The CENTAUR 6-10

Does all the Work of Man and Team

Small Farm — Truck Farm — Orchard — Vineyard

Nothing half-way about the Centaur Tractor. It does all the work of man and team in tilling and cultivating the soil. Its six horse-power on the drawbar—ten horse-power on the belt makes it a real riding tractor—not a combination riding and walking job. Equipped with Centaur tools, it does the back-work, the arm-work and the leg-work of tillage and cultivation operations—all the man has to do is supply the brain-work to drive it over the field.

The new improved Centaur brings profitable power to small acreage at low cost.

It plows with a full-size 12 inch plow, discs, harrows, plants, cultivates, mows, does belt work and a variety of other jobs with the complete line of special tools. It really makes the small farm and truck farm a power farm; makes orchard and vineyard culture more profitable and more enjoyable.

Read the Advertisements

they keep you to the fore of modern life. Through advertisements you've laid down the shovel and the hoe. You can buy a whole harvest ready-to-eat in cans. You've hung up the fiddle and the bow, for a radio. There's little old-time work left in this age of amazing short-cuts. Read the advertisements carefully and when answering them, say you saw their ad in Pennsylvania Farmer.

Philadelphia Produce Review

THE Philadelphia egg market opened in a steady position with prices fairly well maintained on average quality stock. The demand in most quarters was sufficient to effect close clearance of nearby eggs. A portion of the arrivals consisted of southern and southwestern eggs, ordinary in quality and available at listings. On Wednesday an active demand developed and prices advanced, despite the fairly liberal receipts of western eggs. The following day the edge was off the market and prices declined fractionally. Receivers held firm on their fine quality marks, which brought premiums in most cases.

It was generally anticipated that lower retail prices would encourage consumption, but this policy did not seem to broaden outlets to any extent. Receipts of nearby eggs were liberal in New York city during the latter part of the week, but the finer qualities met a good demand. The fancy closely selected stock brought the usual premium over quotations. There was some accumulation of nearby of average quality and this stock was hard to move. Nearby whites ranged from 28¢ to 32¢ per dozen, brown eggs from 28½¢ to 31¢ and mixed colors from 22¢ to 28½¢.

Butter Improves

The butter market during the week showed a decided improvement and prices advanced around 2¢ per pound on 92 score goods. Trading was more active in most all quarters. For the first time in several weeks receipts of butter were lighter than on the corresponding week a year ago. A slight improvement in the demand for storage butter was noted in the eastern markets. There is the belief that the low prices which have prevailed in all sections of the country have increased the consumption of butter. Butter production appears to be holding up well.

Poultry

There was a good demand for Leghorn fowl on the New York market during the latter part of the week while heavier colored fowl were barely steady. Receipts of nearby broilers were rather light but there was some accumulation and the market showed a weaker tendency. Fowl sold at 33¢ to 34¢ per pound, chickens at 23¢ to 35¢, Rock broilers at 30¢ to 45¢, Reds at 25¢ to 40¢, and Leghorns at 37¢ to 40¢. Fresh killed fowl were in light supply and the market was firm, especially for 4 pound and lighter stock. Fresh large fowl met a better demand. Receipts of nearby hot house broilers were very light with the market firm. Many however were poorly graded, or lacked quality and prices ranged from 25¢ to 47¢ per pound.

Potatoes Dull

The Eastern potato markets were generally dull during the week with trading slow. Philadelphia was the one exception to this and showed considerable improvement. The lower tendency of potato prices this month has brought a slackening in carlot shipments which are now running around 600 cars a day. Growers are indifferent about hauling at prices and refuse to sell at the prices dealers are offering. There seem to be few growers that are willing to sell as low as \$1 per bushel in western New York and most sales in the district are around \$1.10. There is very little speculative interest at present and considerable difference in opinion as to the amounts of potatoes that will be shipped from Pennsylvania, New York and Maine as well as other late producing sections.

Prices of Pennsylvania potatoes ranged from \$2.40 to \$2.90 per 100-pound sack with Philadelphia reporting the highest price. Various trade reports estimate that there were around 41,425 cars of old potatoes left on March 1 for shipment after that date. If this is correct, this is less than actually shipped during any season since 1919-1920.

Apples Steady

The apple markets continue about the same as for the last month. Trading has been rather quiet with prices of good stock well maintained. Supplies in eastern markets were moderate to liberal. Eastern Yorks and Baldwins sold around \$5 to \$6 per barrel at most points while Winesaps were reported at \$7.50 in Philadelphia. There seems to be considerable scald in the offerings in Philadelphia. The demand at shipping points showed a slight improvement with a few sales for export. Shipments of sweet potatoes ran around 40 to 50 cars daily with Dela-

ware and Tennessee still the leading sources of supply. The carlot movement from New Jersey has dropped and some days no carlot shipments were reported. Supplies of good sweet potatoes were rather light in Philadelphia and New York. The bulk of the offerings are of only average quality and sold around \$1 to \$1.25 per bushel. Fancy bright well graded stock was scarce and sold up to \$2.25, while plainer grades of stock from the Swedesboro section around \$2.50.

LIVESTOCK

PITTSBURGH

Cattle

Monday's supply was very light, only about 30 carloads. The few good fat steers were generally strong to a quarter higher, though none as good as last week's offerings. One load of well-fed 1,200-pound steers brought \$13.35 and one load of about the same weight \$13.10, while plainer 1,200-pound steers sold at \$12.50. Best heavy weight steers brought \$13 to \$13.25, only two carloads being good enough to command such prices. Useful handy weight butchers steers with flesh went at \$12 to \$12.25, lighter and plainer kind at \$11.25 to \$11.50, and common \$10.50 to \$10.75. Heifers were scarce and firmer. Cows were no more steady, few above \$9 per cwt. Calves brought \$5 to \$5.25 largely. Bulls were quite dull, with good heavy kind around \$9 to \$9.15. Bologna brought \$9 to \$9.50, mainly one carload at \$8.10.

Prime fat steers \$12 to \$13.25
Choice steers, 1,200 lbs. or over 12 75¢ to 12 50¢
Good to choice, do. 12 25¢ to 12 50¢
Fair to good, do. 11 50¢ to 12 00¢
Plain heavy steers 11 50¢ to 12 00¢
Choice handy-weight steers 12 75¢ to 12 50¢
Good butcher steers, 1,000 to 1,150 lbs. 12 25¢ to 12 50¢
Fair to good, do. 11 50¢ to 12 00¢
Ordinary to fair, do. 10 50¢ to 11 00¢
Common, do. 10 00¢ to 10 50¢
Good light butcher steers 11 25¢ to 11 50¢
Fair to good light steers 11 00¢ to 11 25¢
Common to medium, do. 10 50¢ to 11 00¢
Interior light steers 11 50¢ to 12 00¢
Feeder steers 9 00¢ to 9 50¢
Stockers 11 00¢ to 11 50¢
Choice fat heifers 10 50¢ to 11 00¢
Fair to good heifers 9 75¢ to 10 25¢
Common to fair heifers 9 00¢ to 9 50¢
Choice fat cows 7 50¢ to 8 00¢
Good to choice fat cows 8 25¢ to 8 50¢
Fair to good cows 7 50¢ to 8 00¢
Common to fair cows 6 50¢ to 7 00¢
Canners 4 25¢ to 4 50¢
Fresh cows, calf at side 5 00¢ to 5 50¢
Choice heavy bulls 7 50¢ to 8 00¢
Fair to good heavy bulls 6 50¢ to 7 00¢
Good handy bulls 5 50¢ to 6 00¢
Fair to good bulls 5 00¢ to 5 50¢
Common to fair bulls 4 50¢ to 5 00¢
Interior bulls 3 50¢ to 4 00¢

Hogs

Monday's supply was light, only 25 to 30 carloads. The market was generally steady with last week's close. Sorted handy-weights going at \$11. Heavy hogs were dull at \$10.50 to \$11.10, while heavy mixed ranges from \$11.25 to \$11.50, all depending on the number of weighty hogs in the lot. Light Yorkers brought \$11.25 to \$11.50, and pigs \$11, these figures representing outside prices, but good hogs of 150 or over went in with the handy weights. Sows ranged downward from \$9.50, with the going price for standard market quality.

Heavy mixed \$10.50 to \$11.00
Heavy Yorkers, 165-180 lbs. 11 00¢ to 11 25¢
Medium wts., 180-200 lbs. 11 00¢ to 11 25¢
Heavy Yorkers, 165-180 lbs. 11 00¢ to 11 25¢
Light Yorkers, 125-150 lbs. 10 75¢ to 11 00¢
Pigs, 90-110 lbs. 9 00¢ to 9 50¢
Roughs 5 00¢ to 5 50¢
Stags 5 00¢ to 5 50¢

Sheep and Lambs

Last week's market showed a little improvement, closing at \$11.50 for top wooled lambs. Monday about seven double lambs appeared, not a large supply, the market was a quarter or so higher. Best wooled lambs brought \$11.25, wethers and heavies out. Clipped lambs increasing in numbers and with favorable weather the bulk will be in that condition hereafter. A few choice clipped lambs brought \$11 per cwt., bulk of the offerings \$10.50 to \$10.75. Some thinish double lambs sold at \$7.50 and ordinary single lambs \$7.25 to \$7.50, fair class \$9 to \$10. A few wooled sheep moved on a \$7 basis while a clipped sheep brought \$6 per cwt., many sheep of top quality appeared.

Good to best wethers \$6.50 to \$7.00
Good mixed 5.50 to 6.00
Fair to good, do. 5.00 to 5.50
Common to fair 4.50 to 5.00
Interior sheep 3.50 to 4.00
Good to best lambs 10.00 to 10.50
Medium lambs 8.00 to 8.50
Culls and common 7.00 to 7.50
Heavy lambs 9.00 to 9.50
Clipped sheep 7.00 to 7.50
Clipped lambs 7.00 to 7.50

Calves

Monday's supply was around 600. Top veal calves brought \$15.50 per cwt. with seconds \$11 to \$13 mainly and thirds \$8 to \$10.

LANCASTER

Cattle

Lancaster, March 10.—Today's receipts amounted to 350 head. The market was new. Beef steers and yearlings were weak; other classes about steady. Good steers are quoted at \$12 to \$13, mediums at \$10 to \$11 and commons at \$8.50 to \$11. One hundred and fifty calves were offered on a steady market, top vealers going \$15.50.

Hogs

Six hundred head were on sale. The market was weak to a quarter lower. Best hogs in the 150-200-lb. class brought \$12.50.

Philadelphia Produce Quotations

PHILADELPHIA
Butter.—92 score, 37¢; 92 score, 36½¢; 91 score, 35½¢; 90 score, 35¼¢.
Eggs.—Graded nearby whites, 27¢ to 28¢; extra firsts, 28¢ to 29¢; western stock, 25¢ to 26¢.
Poultry.—Live, fowls, 26¢ to 32¢; chickens, 33¢; old roosters, 22¢ to 23¢; pigeons, pr. 25¢; ducks, 22¢ to 23¢; turkeys, 25¢ to 30¢.
Fruit.—APPLES, N. J. Md., Dela. & Pa., baskets, Yorks, \$1.75 to \$2; Grimes, \$1.50 to \$1.75; Romes, \$1.75 to \$2.25; Winesaps, \$2 to \$2.25.

Eggs.—White, nearby, average extras, 28¢; extra firsts, 28½¢ to 29¢; mediums, 26¢ to 27¢.
Poultry.—Live, by freight, fowls, 32¢; roosters, 15¢; geese, 16¢; ducks, 22¢.

LANCASTER

Butter.—Country butter, 50¢ to 55¢; cream-butter, 45¢ to 50¢.
Eggs.—Fresh, 26¢ to 30¢.
Poultry.—Chickens, \$1.25 to \$1.50; springers, 75¢ to \$1.25 each; ducks, \$1.25 to \$1.50; turkeys, 25¢ to 30¢ each.
Fruit.—APPLES, 20¢ to 30¢ ¼ pk. CRANBERRIES, 25¢ per lb.
Vegetables.—ASPARAGUS, 20¢ to 25¢ per bunch. BEANS (string), 30¢ to 35¢ ¼ pk. BEANS (Lima), 35¢ to 40¢ pint. POTATOES, 10¢ to 15¢ bunch. BRUSSELS, 30¢ quart. CABBAGE, 10¢ to 20¢ bunch. CARROTS, 8¢ to 10¢ bunch. CAULIFLOWER, 25¢ to 45¢ head. CELERY, 10¢ to 20¢ bunch. CUCUMBERS, 8¢ to 10¢ each. EGGS, 20¢ to 30¢ each. ENDIVE, 50¢ to 100¢ head. LETTUCE, 10¢ to 20¢ head. MUSHROOMS, 25¢ to 30¢ per pt. box. ONIONS, 20¢ to 30¢ ¼ pk. ONIONS (green), 10¢ bunch. POTATOES (old), 15¢ to 20¢ (new), 30¢ to 35¢ ¼ pk. PEAS, 17¢ to 20¢ bu. POTATOES (sweet), 10¢ to 15¢ peck. PEPPERS, 60¢ each. RADISSHES, 10¢ bunch. PEAS, 30¢ to 35¢ ¼ pk. SPINACH, 15¢ to 18¢ ¼ pk. TOMATOES, 25¢ to 30¢ pint box. TURNIPS, 10¢ pk.

YORK

Butter.—Country, 45¢ to 50¢; separator, 50¢ to 55¢.
Eggs.—Fresh, 26¢ to 28¢.
Poultry.—Hens, live, 28¢ to 32¢ per lb.; roosters, 15¢ to 20¢; geese, 16¢; ducks, 22¢ to 23¢.
Fruit.—APPLES, 13¢ to 30¢ ¼ pk. Stay-outside prices, but good hogs of 150 or over went in with the handy weights. Sows ranged downward from \$9.50, with the going price for standard market quality.

Heavy mixed \$10.50 to \$11.00
Heavy Yorkers, 165-180 lbs. 11 00¢ to 11 25¢
Medium wts., 180-200 lbs. 11 00¢ to 11 25¢
Heavy Yorkers, 165-180 lbs. 11 00¢ to 11 25¢
Light Yorkers, 125-150 lbs. 10 75¢ to 11 00¢
Pigs, 90-110 lbs. 9 00¢ to 9 50¢
Roughs 5 00¢ to 5 50¢
Stags 5 00¢ to 5 50¢

Pittsburgh

Butter.—Extra, firsts, 25¢ to 25½¢; nearby whites, 25½¢ to 26¢.
Eggs.—Live hens, heavy, 28¢ to 29¢; Leghorns, 27¢; old roosters, 15¢; geese, 16¢; ducks, 22¢ to 23¢; pigeons, 40¢ to 50¢ per cwt.

FEED MARKET

The following quotations are for transport nearby shipment March 7, according to the U. S. Bureau of Agricultural Economics. They show the approximate price of feed per ton (all in 100-lb. sacks) grain per bushel in carlots arrival basis delivered on track at Philadelphia and Seaton rate points:
No. 1 white oats, 51¢; No. 2, yellow, 48¢.
No. 3 white oats, 47¢; No. 4, yellow, 44¢.
No. 1 white oats, 51¢; No. 2, yellow, 48¢.
No. 3 white oats, 47¢; No. 4, yellow, 44¢.

HAY AND STRAW

Philadelphia quotations.—No. 2 timothy, No. 3 timothy, \$15.50; sample hay, No. 1 mixed clover, \$18; No. 2 mixed clover, \$15.50.
1 straight vey, \$18; No. 1 wheat, \$12.50.

CHICAGO CASH GRAIN

Chicago, Ill., March 10.—The following prices ruled here today: No. 2 hard red winter wheat, \$1.06½; No. 3 yellow corn, 80¢; No. 2 white oats, 41¢ to 41½¢.

Mr. H. O. Elliott of Euclid, Pa., (center) who says: "My potatoes grown with 'AA QUALITY' Fertilizer yielded 300 bu. per acre this year—200 bu. more than most growers in this locality obtained."

POTATO YIELD TREBLED

Gets \$380 Extra Cash per Acre

SOME folks say all fertilizers of the same chemical analysis produce about the same results. But you can't fool a potato plant that way. The crop quickly detects the superior crop-producing power of "AA QUALITY" Fertilizers... and registers this important difference in terms of bigger yields, better crops... and increased farm profits. These facts supplied by Mr. H. O. Elliott, Euclid, Butler Co., Pa., are typical of hundreds of crops which prove the profit-increasing power of "AA QUALITY" Fertilizers:

"This year I used 650 lbs. of 'AA QUALITY' Fertilizer per acre on potatoes, and am most pleased with the results. My crop yielded 300 bu. per acre—or about 200 bu. more per acre

than most growers in this locality obtained.

"Fifteen years ago, when I began farming, I was fortunate enough to use 'AA QUALITY' Fertilizer. It produced a splendid crop that year, and it has been equally satisfactory every year since. In all these years I have carefully observed the crops grown with other brands of fertilizer, and am convinced that 'AA QUALITY' Fertilizers are far superior as crop producers to any that are used in my section."

Mr. Elliott sold his potatoes for \$1.90 per bushel, so his 200-bushel-per-acre increase in yield meant \$380 extra cash per acre.

40 Tons More Ensilage per Acre

The same kind of results are reported on all crops. For instance, Mr. Peter Chapple, of Malone, Franklin Co., N. Y., got a yield of 50 tons of ensilage corn per acre. The average in his locality was 8 to 10 tons. Mr. Chapple wrote, on October 7, 1929: "Good seed, careful cultivation and 'AA QUALITY' Fertilizer did the trick. By careful comparison I can positively say 'AA QUALITY' goods give me at least twice the yields I get with other makes of fertilizer."

Regardless of the kind of crops you grow, you will be money ahead at harvest time if you use "AA QUALITY" Fertilizers.

Try "AA QUALITY" Fertilizers this year. Your nearby dealer is ready to serve you. See him this week.

FREE How to Save Money ON MATERIAL

The Jamesway book which we send you FREE will show you how to save money in many ways when you are building, remodeling or equipping any farm building. Our many years of experience in planning and designing practical, convenient layouts for farm buildings has taught us how to plan buildings to save cost of material and construction. We can also tell you how best to plan your building so as to save steps and save work at chore time. We know just how every door, every window, every stall, should be placed and the whole general arrangement should be made so that the light, air, heat and moisture will all be properly taken care of. In short, the Jamesway service will save you all regrets and costly mistakes.

*Your Goulds Ever-Oiled Water System
Requires No Attention*

RELIABILITY and freedom from attention are the chief requisites of your home water system.

Goulds Ever-Oiled Water Systems are reliable—the pumps are unconditionally guaranteed for two years of reliable service. And they do not require attention—the pumps never even need oiling. They are equipped with ball bearings permanently sealed in grease. And the many automatic features do away with the need for attention.

You will find a water system exactly suited to your needs in the Goulds line of 12 different sizes and styles, electric and engine driven, ranging in price from \$75 to \$135. It will pay you to take advantage of the experience gained by Goulds in 80 years of fine pump making.

Ever-Oiled Outfit W-205
Complete pressure tank system. Supplied with pressure switch and relief valve and with 42-gallon galvanized-iron tank, connecting pipe and fittings and automatic air-volume control. It has a capacity of 210 gallons an hour and costs \$109.00 complete. It is driven by 1/4-hp. electric motor and is fully automatic in operation.

Ever-Oiled Outfit W-200
A pumping unit only which can be attached to any suitable pressure or storage tank. Supplied with 1/4-hp. a.c. or d.c. motor, pressure switch, air valve, and relief valve. Non-slipping V-belt drive with belt-tightening adjustment. Pump and motor mounted on pressed steel base. It has a capacity of 210 gallons an hour and costs \$83.50 complete.

Ever-Oiled Outfit R-202

V-belt, engine-driven outfit to furnish running water to farms not supplied with electricity. Equipped with 1/4-hp., 4-cycle gasoline engine with foot starter. Endless, non-slipping fabric and rubber V-belt with tightening adjustment. Mounted on heavy oak base. Capacity is 210 gallons an hour. Price, \$120.00 complete.

Where Ever-Oiled Water Systems are Obtainable

The complete line of Ever-Oiled Systems is now available through the following distributors or their dealers:

ALLENTOWN, PA.: Wm. H. Taylor & Co., 250-56 Hamilton Street.
BALTIMORE, MD.: Chatard & Norris, 218 Water Street.
LANCASTER, PA.: Henry R. Herr, The Pump Man, Ann and Fulton Streets.
PHILADELPHIA, PA.: Goulds Pumps, Inc., 111 N. Third Street.
PITTSBURGH, PA.: Goulds Pumps, Inc., 636 Henry W. Oliver Bldg.
PITTSBURGH, PA.: Tranter Mfg. Company, 105 Water Street.
PITTSBURGH, PA.: Malone Plumbing Supply Company.
READING, PA.: Lang Engineering Company, 334 Walnut Street.
YORK, PA.: Geo. F. Motters' Sons, S. Water and W. Princess Streets.

For those in need of information on specific pumping problems, Goulds Pumps, Inc., has a wealth of data available at any of the above distributors or their dealer in your neighborhood. Let them help you solve any of your pumping problems.

If your dealer can not give you the desired information, write us for catalogue showing the complete Ever-Oiled Water System line.

SENECA FALLS, NEW YORK

Farm Facts and Fancies

By ALVA AGEE

OF course there is ground for criticism of that 3-10-6 formula for a fertilizer to be used on thin soils in our eastern country. There is no claim that the suggestion made on this page a few weeks ago has any value for the man who has been testing his fields and working out their needs. We have in mind the hundreds of thousands of acres in farms of readers who have made no careful tests but do know that they want to lift the land into a productive class and asks, "Where do I go from here?"

The answer I made was that the chances are that, if the soil has half-fair physical condition, it will make good returns from a fertilizer in which the phosphoric acid is three times as great as the nitrogen, or a little more, and the potash is two times as much. Stating the case differently, when something is to be tried and there is no certainty that these ratios are the best, they do make the safest starting point I know of. The land is pretty apt to respond profitably. The question in mind is ratios, and the percentages named years ago may well be higher today when we have richer materials to go into fertilizers. In that case less per acre can be used.

Later On

Having tried a combination of this sort, and I hope profitably, the next thing is to learn whether any change in it can be made with advantage. A reduction could not well be in the nitrogen until legumes or manure add to the soil supply. It could not well be in the phosphoric acid in the case of eastern land because nearly always it is deficient. A study of some experiment station results shows that available potash may be in sufficient supply in our heavier soils even when they are poor, but that later on potash pays its way and adds a profit.

The station plats I mentioned indicated at first that phosphoric acid, lime and nitrogen gave the answer, but as time has come along we find more emphasis put on the need of potash in the fertilizer. Quite possibly it would work out that way in the case of the land we are considering, but that we do not know, and I should risk the investment in potash on the field I wanted to crop, and at the same time begin a test to make sure it is essential. As I have said, continued cropping brings the use of potash into more prominence.

Varying Soil Needs

"Effective systems of soil treatment for a particular field or soil type change from time to time." That is the statement of the Illinois Experiment Station after "careful investigation of various systems of soil treatment for more than twenty years on the Illinois soil experiment fields."

The "rough-and-ready" starting point suggested for our readers who are not content to let a field remain a burden on them is only a starting point. Not only that, but if they knew exactly what to use today it should be modified later on. As nitrogen grows cheaper, which is probable, it can be used more freely for standard crops that cannot make as much return on the investment as vegetables do. As we make surer of good seed, disease control and the best culture, we safely increase the amount of fertilizer risked on a crop. This is aside from the actual soil changes to which the station referred.

Organic Nitrogen

It is the wrong time of the year to talk about fall plowing but some results of drainage water studies made by the Illinois Station bear indirectly on that practice and helped to clear up my thinking. We usually talk about the safety of plowing a soil

down in the late fall provided the soil is pretty well frost-locked during winter. That is true enough, of course, but these station tests show that the latitude of the northern half of Illinois the organic nitrogen is non-leachable during the six months from October to March inclusive. The nitrifying bacteria that convert organic nitrogen into a soluble form are inactive at the soil temperatures those months. Very little nitrate was found in the drainage water, the loss of potash and lime was seemingly checked.

Our Labor Problem

Americans do not take kindly to back-breaking jobs. We have had much discussion of the situation of Mexicans to take care of labor needs of the ranches growing vegetables, fruits, cotton, etc., in southwestern states. Tens of thousands are needed, and producers couldn't go along at half its pace without them. The South, the negro, and would be strained without him. All over the country and especially in the East, we have an immense number of people of foreign birth who are doing much of the hard work.

The Southwest wonders if it has its development hampered because it did not attract a sufficient number before immigration laws came strict. I am not arguing the question at all, but stating the fact. I do think, however, that we are more danger from people of more tendencies who try to promote themselves than we are from those who cross the border to work on ranches. Our relations to other peoples, political and commercial, are a continuing puzzle to me.

Unemployment

Much is being made of present unemployment. A lot of it exists, all of us have our sympathy stirred by any man who needs work, and it cannot get it. Doubtless employment will grow less as spring activities are in full blast, some economists I value say matters will grow better industrially throughout the year.

But the figures of unemployment broadcasted by some critics of government are not impressive. I assumed that every idle person was to work, and one would reckon that his limited observation that there must be a great host who do not work. If their number was substantial, we should have a fair picture of conditions. The chances are that demand for labor will increase now on. Our industries are trying to mend matters as fast as possible, criticism gets us nowhere. We are a panic of sorts, and are recovering much faster than usual.

Lettuce

LETTUCE is decidedly a cool season crop. Plant it early in the spring as soon as the ground can be worked. Leaf lettuce is a sure spring crop, than head lettuce. Prizehead, in my opinion, is a leaf lettuce. It is very good one for the home garden. The leaves show a touch of red in warm weather comes early the leaves may be used for leaf lettuce. However, if they fail to head. The chance of success are good if you start plants under glass. Use May King or amaranth, two early-heading varieties. Lettuce rows are spaced 12 inches for hand cultivation. This is for the plants begin to crowd another. Leaf lettuce may be planted at first to four-inch spacing. Every other plant should be used. Head lettuce needs ten inches more or less, between plants.

"I have used Pratt's exclusively in feeding my stock and think we've achieved wonderful results. One of my pullets hatched April 11th laid its first egg August 23rd, four months and 12 days old. She is still performing. Here's her record to date: August 23rd to 31st, 7 eggs; September, 2 eggs; October 1st to 10th, 2 eggs. I also have Columbia Rock pullets laying at an early age. I used no other feeds than Pratt's."

Oscar D. Reese

3 lb. 4 oz.

1 & 3/4 oz.

THE VITAMIN D GUARANTEES Most Growth per Pound of Feed—at 1/4 the cost

new need to be reminded that growing pullets is all expense—no income.

The quicker you bring them to maturity, the better.

Pratts has always contained the vitamins, animal protein and minerals that give the greatest growth of bone, muscle and feather per pound of feed. Thousands of poultrymen know it!

Now you have extra assurance.

For this fine standard growing mash is processed with

an abundant supply of

Vitamin D that April's

growing birds have all the

benefit of July sunshine.

Vitamin D is the vitamin

that helps birds get the

and none of the bother of cod liver oil greatest value from food elements of their mash.

Sunshine is the natural supply. But modern poultry raising demands that birds be grown at the times of year when sunshine is most scarce and weak.

Here is a full supply. Right in the feed so they're sure to get it. Surely

no one will deny the value of these ingredients in building bone, muscle, feather, nerve and egg-making vigor: dried buttermilk, feeding oatmeal, corn meal, wheat middlings, meat scrap, fish meal, alfalfa meal,

and necessary minerals. Now their full value in building your birds to a healthful early maturity is further insured by this special Vitamin D processing. The Vitamin that makes certain that birds get the nourishment in these splendid ingredients, guaranteed not only as to quality but as to uniformity of proportion. Every bag of Pratt's is exactly like every other. Uniform feed gives uniform results.

See your Pratt dealer. If you are in doubt as to which local dealer sells Pratt's, write us.

19 BUSHEL More Oats per Acre through SMUT CONTROL

ILLINOIS EXPERIMENT STATION Reports Big Increases with Ceresan Seed Treatment

The easiest way to obtain a bigger oats yield without increasing your present acreage is to prevent smut damage by using a safe seed treatment.

Many tests have proved that this is true. The Illinois Agricultural Experiment Station reported that dust treatment of smutty Big 4 seed oats increased the yield per acre from 67.6 bushels for the untreated seed to 86.7 bushels for the treated—a difference of 19.1 bushels. Smutty 60-Day oats treated with the same dust disinfectant, yielded 13.8 more bushels per acre than the untreated seed oats.

The dust disinfectant that produced these profitable yield increases and gave perfect smut control was Du Bay Ceresan. It is always safe to seed oats; deadly only to seed-borne disease organisms that reduce germination and injure the crop.

Ceresan Prevents Smut Losses

In 1928, Iowa alone lost 18,000,000 bushels of oats because of smut. In 1929, state and federal authorities report smut losses were unusually severe in Iowa, Kansas, Minnesota, Missouri and Wisconsin.

Such losses now can be prevented by Ceresan seed treatment. Wisconsin Circular 133 reports good control of oats smut in that state with Ceresan. According to the August, 1929 *Plant Disease Reporter*, Ceresan gave "good control" of oats smut in Iowa and "excellent control" in Kansas.

By R. P. KESTER

I HAVE had some inquiries lately asking where we bought our baby chicks. My reports of our unusual success in raising baby chicks to maturity have induced others to want the name of the hatchery. Some of the letters say very complimentary things about hatcheries they have dealt with.

Now let us examine the question dispassionately. While our success was unusual, almost phenomenal, it must be remembered that it was not all due to the stock. Those chicks had the very best of attention from the time they first went under the hover on through their growing period. That care included the feeding of a first-class ration made by a reliable manufacturing company. It included scrupulous care of house and brooder. The chicks were never allowed to become chilled nor overheated. These things must be credited with a big percentage of the success, and the lack of them accounts for the failures experienced by many chicken raisers.

No doubt there are some dishonest hatcherymen. There are dishonest men in every business. But running a hatchery is a precarious business. No one can foretell at the beginning of the season how eggs will hatch. There is considerable expense in running incubators, and it is natural to want to keep all the money and fill all the orders that come in. Many people fail to send in their order until near the time they actually want the chicks, and it often happens that all, or even more, are booked than can possibly be shipped at a given time. Of course, the right method would be to send back the money if a definite request cannot be complied with. But hatcherymen are human, and many times the money is kept until chicks can be sent from a later hatch.

Use on All Seed Grains

Ceresan destroys seed-borne disease organisms on many other seed grains. The January, 1929 issue of *Phytopathology* says: "... Ceresan has given satisfactory results in controlling stinking smut of wheat, covered smut and stripe of barley, loose smut of Tennessee winter barley, the smuts of oats, and covered kernel smut of sorghum." It also prevents disease losses on rye, millet and cotton.

Quick, Economical Treatment

It costs only a few cents per acre to protect your grain crops against diseases with Ceresan. And only a few minutes are needed for Ceresan treatment. Just dust it on at the rate of 3 ounces per bushel of seed oats, barley or cotton; 2 ounces per bushel of seed wheat, rye, sorghum or millet. Not a disagreeable wet treatment. No danger of injury to germination. Seed may be treated a month before planting and stored without risk of reinfection by disease spores from contaminated bins or sacks.

Ask your dealer today for our free new Ceresan pamphlet. Or write to Bayer-Semesan Company, Inc., 105 Hudson Street, New York, N. Y.

A woman writer in Chester county wants to know how to manage land that one does not desire to farm in cultivated crops so that it will not deteriorate through lack of use. Part of the land is in pasture, but other fields are full of weeds due to failure of grass seeding.

If the land is adapted to alfalfa, that is, if it is not wet and contains plenty of lime, the best plan would be to prepare the soil well and seed heavily to alfalfa in August. If the land is not such as will erode from summer rains it would be a good plan to plow it early in the summer and keep it harrowed so as to kill the weeds as they germinate. I would advise this lady, also, to seek the advice of the county agent of her county. I know him to be able and willing to advise.

Farmers in this section of the country seem to have little trouble this spring in engaging farm help. Men are seeking employment in every line. I passed two or three employment agencies recently and there was a crowd of men before the doors of each of them. It cannot be denied that the unemployment situation is acute here and near the big cities. Relief is expected in the shape of revived industry within the next few weeks, but in the meantime people must live somehow. I see that one industrial leader advises paying higher wages and reducing prices. But when times improve it is to be hoped that many people will have imbibed some of the wisdom to be gleaned by listening to "Amos 'n Andy." Amos, in spite of his lack of pretension, has some good horse sense that would do anyone some good.

Friendly Talks

By Edgar L. Vincent

HOW are you doing your fighting? This morning one of the radio entertainers dropped a word that has been in my mind ever since. He said there no manure was applied. This group of tests a good many folks were fighting their backs, but they were fighting. Fighting on their backs. Practically everybody that I know of has been fighting on his hands. May be, but of one kind or it may be of another, but we are all bound to make this fight, and really we are bound to make it the best fight we can.

But fighting on our backs. That is something different, and it means a harder fight and a longer fight than for any of the rest of us. And I was thinking this: Ought not those of us who are able to stand on our feet and wage our battle in a manly, forceful square way be supremely happy and thankful, too, that we are not clear down flat on our backs and doomed to defend ourselves from that position or give up beaten?

Most of us are good and strong in our bodies. How is it in our hearts? Are we full of courage and go every morning when we get up and we are sound and able-bodied and we are sick and down and out? It is so many of us and complaint of our bodies. Much of our complaining is absolutely without cause, for although we have a tough job on our hands a thousand more things are in our favor than are against us. Things always come better for the man who keeps cheerful and holds right on till the sun goes down. It is then that crows sing given out and not in the middle of the afternoon.

Potato Fertilization

By J. B. R. DICKEY

three, averaging a decided loss, while 12 per cent averaged 13 bushels less than eight per cent for the three years.

With manure and only 800 pounds of fertilizer in Cambria county, ten per cent compared to eight gave a loss one year and gain the other, the average gain being only two bushels. In Mercer county with manure, ten per cent gave a decided loss two years and no gain the third year as compared to eight per cent. Twelve per cent gave a further loss two years out of the three.

A 1-2-2 Ratio Seems Best

Just why the higher percentages of phosphoric acid reduced the yields so frequently we do not clearly understand, but the evidence seems pretty plain that even with manure and moderate amounts of fertilizer eight per cent is about enough and that more may be dangerous.

In regard to potash on the Lehigh county shale the average for six years shows a regular and very profitable increase up to seven per cent. Nine per cent compared to seven per cent gave an average increase of only four bushels and in two years there was a decided loss from the nine per cent application.

On the Lehigh limestone the increases from potash were still more marked up to seven per cent. In two years there was quite profitable increase in going from seven per cent to nine per cent. The other year results were inconsistent.

Last year, the test on the limestone soil showed an increase from seven per cent to nine per cent of 33 bushels. This also happened in Mercer county with an increase of 25 bushels but showed a loss of 13 bushels in Cambria county. There was no test on the Lehigh shale last year, but in other dry summers we have noticed that the high potash plots stayed green longer and made a larger yield.

In all three of the past years' tests in Cambria county nine per cent gave a loss compared to seven per cent, averaging 24 bushels. In 1927 and 1928 in Mercer county the average loss from nine per cent compared to seven per cent was 25 bushels, this with only 800 pounds of fertilizer in both cases, but with manure.

Summarizing the above results it would seem that a 1-2-2 ratio, such as a 4-8-8, was about the best under all conditions tried. Up to these percentages was usually profitable but above these we find a loss in yield in quite a few cases. With manure three per cent of ammonia may be as much as pays, and it apparently rarely pays to go above seven per cent of potash. Without ma-

nure a little more potash might pay, but a 4-8-7 is apparently not far wrong wherever tried.

We also have some evidence as to the most profitable amount per acre. In six years on the Lehigh shale without manure the average yield for 900 pounds of 4-8-5 was 346 bushels per acre, from 1,200 pounds 355 bushels and from 1,500 pounds 355 bushels. With 300 pounds of fertilizer costing about \$5 the nine-bushel increase from 900 to 1,200 pounds was not particularly profitable unless potatoes were a good price, while the increase from 1,200 to 1,500 was clearly made at a loss, the yield was decidedly less two years out of the six. On the limestone soil there was also a decrease in yield from applications above 900 pounds two years out of three though a 4-12-4 mixture was used here, which may have supplied too much phosphoric acid.

In Cambria county with manure the results show increases up as high as 1,500 pounds, but the figures are rather inconsistent and here again a 4-12-4 ratio was used which may have given insufficient potash. In Mercer county two years' tests show 900 the best one year and 1,200 the other with 1,500 only one bushel above 900 one year and eight bushels below 900 the other. According to these tests large amounts have seldom proved profitable and not infrequently have reduced yield. With the clover sods and heavier soils which we use the amounts required in other states seem unnecessary.

"Quality" in a potato fertilizer is a very questionable term. Source of nitrogen was formerly considered important, but tests here and elsewhere do not show any particular superiority of one source or combination of sources over another.

Plant Food for Corn

IN the March 1st Pennsylvania Farmer H. D. gives his experience with 20 per cent phosphate on corn. No doubt his 350 pounds of superphosphate benefited his corn and hastened its maturity as he says, but I am wondering if a smaller application of a 2-12-4 or a 4-8-6 fertilizer would not have given him a larger and stronger stalk with a larger ear that would have matured just as early.

The 350 pounds per acre of 20 per cent superphosphate would have furnished him 70 pounds of available phosphoric acid, enough to grow approximately 100 bushels of corn per acre. This crop would require the soil to furnish more than one hundred pounds of nitrogen and about the same amount of potash. The soil which could supply that much of both of these foods could also be trusted to furnish some phosphoric acid.

Most crops are in need of some available nitrogen in the early part of the season and I find that they respond readily to a light application of these plant foods. Phosphoric acid with stable manure makes a well balanced plant food. I find that it is a much better fertilizer for corn than superphosphate alone.

I also find that stable manure applied to the soil direct from the stalls during the winter season, as Thomas Jones recommends in the same issue of the paper, is preferable to allowing it to lie about the stable to rot until spring.

The well rotted manure is all right as a fertilizer, as H. S. Baker says, but it should rot in the field rather than in the stable or the shed. The field is better prepared to care for the manure especially if it is a soil than the stable is. A. J. Legg

FARM HELP

FOR the first time in many years this month has brought us no letters from farmers who want farm help. We have had a few letters from men who want work on the farm but none from farmers who want men. Has a combination of machinery and different conditions in other industries solved the farm labor problem? Official reports indicate that wages of farm labor are lower, which is evidence of a sufficient supply.

STORAGE EGGS

THOSE who stored eggs in 1928 lost heavily and that was not good for the spring market of 1929. But the eggs stored last spring have made money, so this spring's surplus will come to a market not adversely affected by the past season's business. The storage of eggs is a highly speculative operation and producers should probably leave it to the speculators; but they are interested in its outcome, for the market for the spring surplus is affected by it.

FROM LIFE

AN immigrant to this country became a successful farmer and feeder of livestock. He prospered so much that he owned many acres, some near home and some in a newer country. His neighbors honored him by electing him to office. The President of the United States honored him by appointment for a special service in the country from which he had fled in his youth. But with all his successes he was unhappy and died broken in spirit and in fortune. For his son—but let us leave the rest to the reader's knowledge of humanity.

EARLY LAMBS

EARLY lambs are those which come to market before the first of July. Official reports indicate that this year's early crop is larger than last year's and in better condition. Tennessee, Kentucky and the Virginias produce the bulk of the crop in eastern territory, and they report as many or more lambs and better ones. Prices are likely to prove disappointing in consonance with prices for yearlings and because a larger proportion will be marketed than usual, fewer ewe lambs being saved for future breeding. In spite of such occasional depressions the business will continue in those regions which have developed it, for no other line of animal industry offers any better returns.

PENNSYLVANIA FARMER

March 22, 1930

A LABOR QUESTION

THAT there is much unemployment in our cities is beyond question. That there is a serious shortage of labor in these same cities appears to be just as certain. The trouble is that the surplus of labor is industrial and masculine while the shortage is domestic and feminine. While many businesses employing men hang out signs to say that no help is wanted many homes are advertising for domestic help. All this suggests the possibility of some readjustment by training men for housework. In other countries men are employed at all kinds of domestic work and do it well. If the women of this country prefer to work in business, and so create a surplus of labor there and a deficiency in homes, why should not some of the men take over a part of the home work? A good cook is a good cook anywhere and can usually command fair wages. Why not more men in this time-honored profession which so many women have deserted? We are not attempting any profound solution of labor problems of either sort, but we are raising a few questions which may be regarded as the reader chooses. Why not raise them?

SAIL ON!

A READER asks this question, which is being discussed in some granges and clubs: "Is there further need for general farm organizations now that the Federal Farm Board is fostering organizations for cooperative marketing?"

We cannot see that the existence of the Federal Farm Board should interfere with the service of farmers' organizations or diminish their usefulness. Even if the Board or some of its agencies did take over a part of the work of an existing organization we should favor the continuance of that organization. For the Board has yet to run two gauntlets and may not get through unscathed or at all. One of these is successful operation of national or large-scale cooperative marketing. The ability of the Board and its agencies to carry on this work economically has not been proved and it can be determined only by experience. The other gauntlet is a legal one, for the courts have not yet passed on the Agricultural Marketing Act or the things it authorizes. The whole thing may be declared unconstitutional when tested, though we do not say that it will be. The functions of the Board are commercial and on a national scale. Organizations with other than commercial functions, and other than national marketing interests, cannot be supplanted by the Board or any agency thereof. So let our useful organizations sail on—they have no reason to do anything else.

A REAL PROBLEM

TAXES must be paid in cash. Farmers must sell something to get the necessary cash. There is nothing new or strange in these statements—they have always been true. But with declining prices for principal farm products more bushels of grain, pounds of meat, gallons of milk or dozens of eggs must be sold to get enough dollars to pay the taxes. The necessity of having these bushels, pounds or gallons to sell will prevent the reduction of production which looks so easy to the theorist but looks different to the man who must pay taxes and other fixed charges out of production.

Something should be done about all this—but what? The answer is to lower taxes—but how? Many suggestions are made, but some of them involve a revolution in taxation and are therefore not to be considered as possible remedies now or soon. Taxpayers' leagues, to study local taxation and expenditures, are suggested and are doing good where at work. Cheaper collection of taxes is proposed, so is limitation of debt of minor units.

All such things, worthy enough in themselves, are palliatives and not remedies. There is any remedy, so far as agriculture concerned, it must come in some change in our system whereby property bears a less proportion of the burden and earnings profits a greater. Such a change may be possible without the delay incident to constitutional amendments. For what agriculture needs is early action, not theories that cannot work without a revolution in our ideas. Pennsylvania agriculture has created a committee to study this problem and is now at work. It should have the help of concerned in agriculture. We pledge it for discussion whenever it is ready for the

A HUNDRED MILLIONS

LAST week the Federal Farm Board made public a letter in which its chairman said: "The present operations of the Stabilization Corporation will undoubtedly result in their having upwards of 100,000,000 bushels of wheat on hand at the close of the present season." The more wheat the Corporation buys the worse for the market hereafter, in addition to the burden of such an accumulation in the hands of one agency is the certainty attending the disposal of it. Buying of millions of bushels by this agency may "relieve" the market temporarily; it may hang a dead weight on it hereafter and a potential demoralizer as well. Let repeat for the twentieth time that no market can be stabilized by injecting into it more certainties, and the uncertainties attending the wheat market increase as the Corporation's pile grows. Up to this time the effect of official "stabilization" may be summarized as more uncertainty and greater instability.

CONFIDENCE

THE Secretary of the American Association of Creamery Butter Manufacturers, Mr. W. F. Jensen, has done a lot of effective work to promote the use of butter. He is discouraged by the recent over-production which caused butter to sell for less than by the competition of butter substitutes or any other conditions, for he says: "Butter as a product is so vital a part of the economic structure of our country, and its inherent qualities in flavor, nutrition and health-giving properties are so important, that it may take for granted that the industry will not be destroyed or seriously disturbed any length of time. In view of this it seems to me that it would be better for the manufacturers of so-called butter substitutes to allow themselves to forget the everlasting endeavor to imitate the appearance of butter pursued by some of them (not all by any means) and sell their product for just what it is, making up their minds that it is the way should be made and sold in order to maintain a permanent position among the food products of our country."

Having said essentially the same thing many a time it is naturally a pleasure to quote this acknowledged representative of the dairy industry. We well remember according to the utterances of the alarm-butter was to be driven off the market; since then it has sold for more than it did before there were any substitutes; the cows that produce it have sold for five times as much. So far as butter substitutes are concerned we had the pleasure of telling the manufacturers years ago that they had started right they could have a market for their products regardless of price. They wasted years trying to counter a known product instead of trying to establish their own—and then were compelled to do what they should have done at the start. Green, pink, white or any other color have been established just as yellow; but the makers of butter substitutes could never be made to see it.

March 22, 1930

NEW JERSEY'S legislators, often accused of not keeping pace with agricultural progress, proved themselves otherwise when they defeated by a vote of 31 to 6 a resolution introduced requesting investigation of the merits of tuberculin tests as applied to bovine animals. The supporters of this bill also ask an appropriation of \$10,000 from the state to carry on these investigations.

Such a request, if made twenty years ago, might have had many staunch supporters, but today it might be likened to Rip Van Winkle's awakening. On March 1st, 51.37 per cent of New Jersey's cattle population of 156,189 were under supervision for the control and eradication of bovine tuberculosis. This comprised 89,683 cattle in 9,902 herds. During the present fiscal year 8,308 cattle in 991 herds have been given the initial test.

When we consider that all requests for testing are voluntary on the part of herd owners, it would seem that rapid progress is being made in eradicating this disease in the state.

EACH year a larger percentage of New Jersey's perishable products is moving to market by motor truck. During the past six months of 1929, truck shipments into the Newark, N. J., market exceeded the amount for the same period of 1928 by nearly the equivalent of 1,000 carloads. During August and September truck receipts exceeded rail supplies while in July they were about equal. Most of the truck shipments originated in New Jersey, and tomatoes as the leading commodity, but during May and June berries were received by truck from as far south as North Carolina.

The New Jersey Bureau of Markets further summarizes the Newark market situation during the past year as follows:

"More cars of fresh fruits and vegetables were reported unloaded and sold on the Newark market during 1929 than in any previous year. The total railroad unloads in 1929 were 184 carloads and included 43 commodities, originating in 33 states, not including Canada and Mexico. During the last eight months in 1929, truck receipts equalled 7,989 carloads, amounting for a total of 21,830 cars of produce handled on the Newark market, or the equivalent of 70 cars of produce for each business day.

"Fall receipts were heaviest during November and December. Unloads of potatoes in 1929 were 363 cars. Grapes were shipped in 1929 by 630 cars, but apples, cabbage and other vegetables were each about 300 cars heavy. Lettuce, celery, sweet potatoes, tomatoes and such unloads were about at 1928's figures. Shipments were received from 33 states during 1929, four less than in 1928. California originated 381 car loads or 381 less than in 1928, but was well ahead of New York or New Jersey which shipped about 1,600 cars each. Grapes were the leading commodity received from California while other vegetables led from New Jersey and potatoes from New York State."

WE also learn that the motor truck is a big factor in supplying the City of New York with fresh fruits and vegetables, especially from nearby truck farms. A total of 30,108 cars were reported on the Jobbing and Farmers' Markets during the past year. Most of the arrivals were from New Jersey and New York. New Jersey supplied 13,091 cars and New York State with Long Island accounted for 12,200 cars. Maryland was third with 1,347 cars, while Pennsylvania supplied 1,047 cars, most of which were mushrooms. There were 166 carloads, mostly berries, hauled from North Carolina.

The heaviest receipts were reported by the dealer on the Washington wholesale or jobbing market with a total of 16,374 cars. Wallabout was the leader of the two Farmers' Markets with 10,194 cars while Gansevoort reported receipts of 3,540 cars.

The following ten were the heaviest in volume of commodities reported during the year: Potatoes 2,073 cars, tomatoes 1,819, corn 1,786, beans 1,613, beans (snap and Limas) 1,566, apples 1,390, celery 1,285, strawberries 1,165 and peaches 1,098.

New Jersey Farm Comment

By G. W. HARRIS

FORTY or more outstanding 4-H club members in Maryland will attend the annual meeting of the All Stars at the University on March 22 and 23. Members of this organization are selected because of their service in club work and in their home communities. In Maryland members are elected at "4-H Club Week" held at the University each August.

There are similar organizations in Virginia, West Virginia and Rhode Island, and it is planned to form an All Star group in Massachusetts this summer.

THE \$100 scholarship offered by the Baltimore and Ohio Railroad to the Maryland 4-H Club boy whose achievements in 1929 were most outstanding was awarded to John H. Price, Jr., of Darlington, Harford county.

E. G. Jenkins, state boys' club agent, tells about John Price's (commonly known as Jack) career

A BRIGHT SPOT IN THE GARDEN

Early in the spring when the daffodils are the only other flowers blooming in my garden, my forsythia bush opens its buds to the sunlight and the bush is a mass of pure gold. As the flowers bloom and are gone before the leaves develop, there is not even a background of green leaves. The flowers last well, but when the leaves come out the birds find the bush an ideal place to locate their nests and hatch their young. Mine usually hides several nests each season.

The forsythia is easily started from slips or roots and grows rapidly with little care, except an occasional trimming. The long shoots should not be allowed to droop over and touch the ground, as they will take root. Those who are improving their gardens should have at least one forsythia, and they will have one bright spot in their garden which will prove a delight to all lovers of beauty.

in club work. Jack started in club work when he was eleven years old. That year he planted an old garden spot on his father's farm in potatoes and while this first venture did not prove so profitable, it did provide the necessary impetus which later on made this young club member successful. The next year he planted more potatoes and produced a sufficiently high quality product to win second prize at the Harford County Fair. The same year he was elected Vice-President of the local 4-H club.

In the spring of 1925 Jack joined his county garden club and enlarged his garden to include many more vegetables. The following year he was elected President of the Darlington 4-H club. Since that time Jack has taken a great deal of interest in purebred pigs and this year sold his sow and litter at a profit of \$55.

In addition to his club projects, Jack has been very successful in winning outside honors. He attended 4-H Club Week at the University of Maryland for a number of years and was one of two boys selected to represent this state at the second National 4-H Club Camp held in Washington, D. C. Last August he was also awarded a scholarship offered by the Southern Planter magazine.

TWENTY club calf records in Hunterdon county, the largest number ever reported in that county, were recorded in the month of February. Kenneth Smith made the State Honor Roll for the fifth consecutive month with his four and one-half year Holstein. This cow made 1,553 pounds of milk and 50.6 pounds of butterfat in the fifth month of her lactation.

PROFESSOR M. A. Blake, of the New Jersey Experiment Station, reports that the recent sub-normal temperatures have had no adverse attack on the birds of New Jersey No. 66, the new

peach seedling recently developed at the Station. This large white free-stone peach ripens the same season as Carman.

THE Camden farmers' market location is being changed from Wright street to a block between Second and Third streets under the Delaware river bridge. This new location makes an ideal place for such a market as there is no need for congestion and the space is sheltered by the bridge. The market will be well-lighted, an office for a market master will be constructed and a competent market master will have charge of the operations. An average of 85 farmers used this evening market last summer at its old location on Wright street.

CROP reports coming from Florida state that sixty per cent of the potato acreage at Hastings was hurt by frost on March 3-4. Other sections of the state suffered from frost but not to as large an extent. This frost will not affect the potato crop in that section other than to delay it from ten days to two weeks.

From Georgia north through the Carolinas and Virginia, reports show that potato planting proceeded under ideal weather and soil conditions and earlier than normal. With these states setting out their potato crop earlier than normal and with the Florida crop delayed, there will be a tendency for the early crop when it does start rolling to come to market in large quantities. Growers in the North still holding part of their last year's crop will do well to watch the movement of the new crop, for it will have its effect on the price of late potatoes during April and May.

PROSPECTS for good crops of peaches and apples in Chester and Delaware counties, Pa., were reported by the orchardists of this section attending the annual meeting of the Delaware-Chester Horticultural Association held at West Chester, Mar. 12. The meeting opened with a luncheon, following which the new officers for the coming year were elected as follows: President, Clarence Kemery; Vice President, John Romig; Secretary-Treasurer, J. R. Edgerton; additional members of the executive committee, C. P. Barnard and Thomas Crowell.

John Reuff opened the afternoon session with a discussion on Orchard Fertility. The need of humus in orchard soils was emphasized and the short sod rotation running through three or four years was recommended as most practical in keeping up the humus content.

Fruit worms, plum curculio, red spider and aphids are the insects most troublesome in this area, stated D. T. Ries, who then went on to explain methods of controlling them. R. S. Kirby laid particular stress upon controlling apple scab this year, for as he pointed out 45 per cent of the scab spores in southeastern Pennsylvania are now almost mature and only awaiting a warm rain to shoot.

FRUIT growers should make a careful examination of their trees previous to the spraying season in order to find out to what extent European red mite and aphid eggs are present.

The European red mite eggs are round, rusty red and so small that the individual eggs cannot be seen without a magnifying glass. They usually occur in masses resembling blotches of red pepper on the under side of the twigs and branches, usually where the bark is slightly rough or uneven. The clusters of eggs can be rather easily detected with the naked eye, although a low powered magnifying glass helps materially. If European red mite eggs are plentiful, one of the oil sprays should be used during the delayed dormant period or before the fruit buds show very much green color.

Aphis eggs are quite different from European red mite eggs in color, size and shape. They are shiny black, oval, and single eggs are large enough to be seen without the aid of a glass. Aphis eggs are most easily found on the one-year wood, usually close to a bud. If any eggs are found it usually means that enough are present in the orchard to justify the application of a spray mixture that will prevent them from hatching. Your county agricultural agent can give you the New Jersey Agricultural Experiment Station spraying recommendations for the control of both of these insect pests, as well as others that are found in New Jersey orchards.

Two Weeks of June in February

By C. L. WHITE

(Continued from last week.)

WE had a long refreshing sleep on the Steamship Evangeline, enroute from Miami to Havana. Then came breakfast and the business of getting landing cards, etc. We hurried out on deck to see Morro Castle and Havana harbor in the bright morning sunshine. The ship, docked; first to come aboard to greet us was Mr. Ernesto Sanchez, chief of Cuban Bureau of Plant Industry and his aide, Mr. Aguilar. Later Mr. Sanchez delivered a brief address of welcome in the name of the Secretary of Agriculture, reminding us that Cubans have not forgotten America's assistance during the war with Spain, and later through such men as Leonard Wood whose good works are much in evidence in Havana.

Only a short time was required to get our baggage through the Cuban customs and out to the waiting automobiles which took us to our hotel, the Alcazar, then on a tour around the city. The narrow streets of the old city, the beautiful public buildings, the ancient churches, homes and fortresses, the tropical vegetation of the countryside, the hospitality of the officials, the sound of Spanish on every hand—all made our stay in Havana an experience not to be forgotten.

It was easy to remember that we were no longer under the Stars and Stripes. There was a saloon on nearly every corner, but we saw no drunkenness, except among American tourists—not of our party. Some of us went to the races. We enjoyed shopping in stores which, like the saloons, had no outer walls or windows—nothing but iron shutters which are pulled down from the top at night.

We sampled Havana's night life, but felt somewhat out of place—especially at the National Casino, a magnificent Cuban Monte Carlo where nearly every one was in evening clothes and where tense, quiet men and women were gambling with what seemed like fortunes to most of us. Some of us saw a girl lose \$1,200 at roulette in a few minutes, and apparently think nothing of it.

Next morning Mr. Sanchez guided us out to the agricultural exposition being held by the province of Havana at General Machado. It was a fair which would put some of our own county fairs to shame in quality of products and methods of staging and management. We couldn't judge the strange tropical fruits and vegetables, but it would be hard to find better poultry anywhere. And after so much Spanish it was a pleasure to hear roosters crow in a language we could understand. There were well-bred Holsteins and Guernseys, too, that looked like crows back home.

In the afternoon we had another country automobile trip, with a stop at the beautiful Tropical

Gardens and a visit to a farm where we saw practically every plant that grows on the island of Cuba. There we learned that banana bunches hanging as we always see them are really bottom end up. We saw a cock fight, with the game cocks wearing "boxing gloves" over their spurs; we learned how the natives climb the smooth trunks of the great royal palm trees like those pictured on the cover page last week, and we discovered that no one knows how good pineapple is until he has eaten a slab of the fresh fruit "out of hand" right off the ice.

Evening saw us back on board ship. This time it was the Iroquois, even larger and finer than the Evangeline. Another good rest and in the morning we learned to complain, as everyone does, about the red tape of the United States immigration and

Homeward bound. We stop for water north of Palm Beach.

customs officials. There were many on the ship besides our party and some of them had the original idea of smuggling liquor in the pockets of coats carried over their arms. We watched these people passing into the cashier's office to pay their fines and say good bye to their bottles; the idea wasn't so original after all.

Our buses were at the docks and they rushed us to our special train where the faithful porters

and the few of our party who had remained in Miami were waiting. Breakfast was ready in the diner. As the last person stepped aboard we started, anxious to get away ahead of the Orange Blossom Special, the Seaboard's crack train. We succeeded, and ran ahead of "The Blossom" all the way north. The run to Washington was made in less than 29 hours from Miami.

There was "something doing" in every car on that homeward trip. As if the "home talent" in each car weren't enough, Mr. East and Mr. Magee organized a grand opera company in Car A and went up and down the length of the train giving concerts or something. Mr. East is agricultural agent of the Pennsylvania Railroad, but on this tour he was Master of Ceremonies, editor and pressman on the Tour Edition, and so on ad infinitum.

The first break in our "family" occurred at Savannah, Georgia, where Mr. and Mrs. McBride left our train. They were the kind of traveling companions one doesn't like to part with. Mr. McBride's activities as agricultural agent of the Seaboard and the many thoughtful attentions given by the men under him throughout Florida helped give us pleasant memories of the Sunshine State.

Thanks to our fast run from Florida we reached Washington at 2 p. m. Friday, four hours ahead of our original schedule and early enough to let nearly everyone get home the same day. Senator Capper met us between trains in Washington. As head of

the organization which sponsored the tour he was glad to see us return safely and in good spirits. Our final farewells had to be said hastily, for the two chartered cars from Harrisburg left Washington almost immediately on the Pennsylvania's fast train, The Spirit of St. Louis. Mr. Harris and the Philadelphia car went a few minutes later, while Mr. Phillips and a good section of our party stopped off in the

(Continued on page 29.)

Some of our party under moss hung oaks and palms at Silver Springs, Fla.

TOOTS did the best he could for Welby, who rarely spoke to him except to order him about, or complain of the result of the day's shooting. The man was a thorough game-hog, as he was a money-hog. He was particularly dissatisfied with the comparatively small bags of brant, a bird that stood high in his estimation as a table delicacy.

"If you're willing to make a longer trip we'll do better with 'em," said Toots. "The feed isn't right here, but yonder on the flats by Sutter's land there's any amount of eelgrass. That's what they like. They always tend

there." "It's your business to take me where I can get birds, isn't it?" said Welby disagreeably. "All right. We'll pack a tent and camp down here," replied Toots. "It's too far to go and come a day."

They set out early the next morning, while the town was still asleep and half obscured by the mist beginning to lift from the water. In cutting by the end of the Broad View pier—the big hotel had been re-opened by the Colonel's heirs—the

apple grazed the black-and-white can buoy that marked the Stinger's home mooring. Rose and had sailed south some weeks ago, the big man having received news of a bit of freight that might pick up. Toots had not seen much of lately, except at the store, where the attractive had of course been Mrs. Ham. Rose had been set by her action in going to work there. To it was a disconcerting assertion of independence and he blamed Toots for aiding and abetting

Sutter's Island loomed up ahead before the apple had covered many miles, a distinct mark of its heavy growth of pine, the other trees in the vicinity being virtually devoid of trees. Toots' goal was one of the blocks of high marsh

the eastward of Sutter's and nearer the flats were he proposed to gun. At one time there had been a number of pines on it, which had been killed by a fire. It was covered now with a dense growth of grass, but Toots knew he could find

dead wood to feed a camp-fire.

A mile or two from Sutter's they passed a little sharpie heading north. The man at its helm was then an "hullo" and a wave of the hand, to which Toots replied. It was Sutter's son, Jeremy.

"What you-all bound?" he shouted. Toots told him and he wished them good-luck, saying that he was going up to Carbury himself on errand that might detain him a couple of

Such trips were rare with Jeremy, who was important in consequence, and quite willing to establish the fact.

"Who's the geezer you got?" he yelled saucily at the lengthening distance between the two boats.

Toots merely nodded, controlling his desire to tell Welby's pompous-looking face turned red at the favored Jeremy's back with a haughty

They reached the bit of marsh in time to make camp and collect a supply of fire-wood and in a few hours' shooting on the afternoon ebb, they killed a fair number of brant, enough to feed a reasonable man, but it only whetted his

to be up and at them the next day. He had lifted his hand in any of the preparations for

light, and at suppers he sat at some distance from the fire and let Toots wait on him.

He had smoked in unobscured silence he turned remarking that there must be no delay in

going out to the grounds in the morning. His implied that he expected Toots to procrastinate if he were given the chance.

may have irritated Welby that he always got a rise out of Toots. He liked to goad

who worked for him to the point of making timid resistance, when he would turn on them

show them once for all who was master and man. But his most cutting remarks did not

to have any power to affect the quiet dig-

with which Toots efficiently did his work.

The next day was an arduous one. Welby was

stout and more exacting than ever. He rather

Toots were not so efficient, in order to have

ance to find fault. He could not very well com-

of his bag of brant, but he wondered why

hadn't had a shot at a snow goose, a few of

rather rare fowl they had seen flying over

flat blind. Once the idea was in his head he

a grievance of it.

only place we can try for those geese is

Sutter's," explained Toots. "They won't come

the 'coys. They roost-up at a sandy spot on

side of the island, and if we camped down

more than a shot or two at the 'snows' to pay for the trouble. We'll have to bed in the grass. A tent would scare the birds."

He rolled up a pair of blankets apiece, stuffing them into his duffle-bag along with provisions enough to last for a couple of meals, and shouldering the bag, led the way to the sharpie. There was sufficient light left for sailing and Toots had no trouble in running the boat into a wide indentation in the northern end of Sutter's. Though at least a mile and a half from the roost of the snow geese it was the only feasible anchorage.

Grass covered this end of the island, thick in some places and thin in others, with a good deal of bad marsh and numerous treacherous pond-holes. By means of a punt pole Toots tested the ground as they walked along in the failing light, making headway slowly and getting well plastered with brackish mud. Welby displayed a certain timidity when his feet were sucked down into the ooze and something not far removed from positive fear while crossing the deeper drains. Only the fact that the undertaking was his own idea kept him from backing down. He was sweating profusely and profanely irritable when they reached the point where Toots decided to camp for the night.

OWING to the proximity of the goose roost they ate a cold supper, and without a fire to temper the air, bedded down, blanket-wrapped, in a nest of tall sedge. Toots was soon asleep, but the dampness of the ground, striking through his coverings, woke him a few hours later, to perceive with surprise a light in the sky. There was no moon and he was positive it was nowhere near morning. He sat up, rubbing the drowsiness out of his eyes, and then jumped quickly to his feet.

"What's the matter?" growled Welby, in response to a tug at his blanket. The next moment he rose stiffly. "What's that? Island a-fire?" He stared at the orange glow. "Any danger of it's coming here?"

"Yes, if it keeps burning," replied Toots beginning to roll his blankets. "Not as far as the boat. The pond-holes and drains would cut it off there. But I reckon we've got to head the other way."

"The other way? What d'you mean?"

"You remember that fellow we passed yesterday—Jeremy Sutter—Well, his folks live over yonder, and the old man's crippled. Ran a stinger's spur into his foot once and got blood-poisoning or something. Never could walk on it very well since. That fire's due to run right over their place and we've got to help Sutter and his wife. Being shut in by the pines that way they might not suspicion there was a fire till it was on top of them."

Welby reached for his blankets. "We've got to?" he exclaimed. "Do you think I'm going into that fire? Here, give me those things."

"Why, they're both too old to be spry, and Sutter's right lame." Toots' tone held a note of surprise.

"They have probably seen it already and got away. I'm not going, do you understand? And it's up to you, Pouchie, to take me back to the boat."

Toots continued swiftly his packing of the duffle-bag. "I'm sorry, Mr. Welby, but I can't go back with you," he said. "You can pick your way with the punt pole. You've got lots of time to make the boat."

He swung the bag over his shoulder and started toward the glow. Welby, after a moment's hesitation, followed, too angry to speak at first, but soon letting out a flood of abuse and remonstrance that seemed to have no effect whatever upon the other. It was only when he caught up and dropped a hand heavily on Toots' shoulder that the latter turned, and said quietly:

"I wouldn't do that if I were you, sir. Better come along with me. Maybe the Sutters will need us bad, and we-all are fit and spry. We'd never forget it, would we, if we went back to the boat and anything did happen to the old folks?"

He had begun to swing along again before he finished speaking. For some reason Welby felt a hesitation about taking hold of his shoulder again, and not caring to be left behind, trotted on also. He was a man who kept himself in good training through golf and other out-door sports, or the pace over the uncertain ground would soon have broken his wind, and as it was he had some difficulty in keeping up with Toots, who carried the duffle-bag and both guns, yet went on with the steady

lope of an Indian. The dangers of the marsh, as he conceived them, were more than Welby cared to face alone, or he would have beat his way back to the boat.

From the ground ahead came a burst of shrill, falsetto cries, as starting as unexpected trumpet notes, and a heavy beating of wings that trailed off into dry, rustling sounds. Large dark bodies, moving swiftly, outlined themselves momentarily against the patch of orange light as the snow geese fled from their roost. The sight, signifying as it did the upset of his campaign against the birds, intensified Welby's irritation.

Their feet crunched into harsh sand a moment later and they were free from the marsh for good. The grass became stouter, less stiffly sedge-like and outlying pines, bent and dwarfed by the wind loomed on either side. Ahead, red veins began to appear in the spreading orange glow and an ominous murmuring was back-blown to their ears. Toots had visited the island several times with Colonel Jersey and his memory of where its wood road lay was accurate. It was more of a trail than a road, but it offered far better going than the woods with their undergrowth and fallen timber.

"She's got a smart hold now," said Toots, referring to the fire.

Welby did not reply, but looked anxiously in its direction. A fierce change had taken place in it. It had acquired a sudden momentum and power, and the murmurous crackling had risen to a confident roar that swelled louder and louder, drowning the explosive poppings of sap-filled branches. The tangle of dry vegetation and resinous pines was as inflammable as oil-soaked rags. The fire leaped from tree to tree, each pine attacked flaring up with a great puff of flame like that from an ignited heap of powder, and shooting its crimson streamers into the scorched needle masses of its nearest neighbor which instantly became a magnificent torch. It was the horrible growing speed of the fire that unnerved Welby. At this rate it must surely cut them off at some point on the trail, between two wings of red death.

"Pouchie," he panted. "We can't do this. It'll get us, man."

"Oh, we'll make it," said Toots.

"We can't, I tell you. Look at that!" a wave of fire rolled forward on their right with the sweep and crash of a breaker leaping by its fellows in an engulfing rush far up a beach. "We'll be caught here—burned—it's death." Welby's voice fluted and broke into a thin, shrill sound suggestive of panic. "Look here—Pouchie—I'll give you five hundred—a thousand—get me out of this—anything—my life's as good as theirs."

"Sho, now," Toots lapsed into the soft southern drawl. "Sure it is. But we'll get there, Mr. Welby. Safe's a cat."

"Two thousand! Anything—you ask—stop—" Welby's pace broke and he staggered sideways into a thicket shrub, which threw him back into the trail again.

TOOTS put down the guns and tossed off the duffle-bag, resigning them to their fate. In the same soft drawl he spoke to Welby encouragingly, grasping him by the arm at the same time. "It's right close yonder, the house," he said. "We'll have 'em out in no time if they're there. We'll cut across to the beach, as nice and easy. Sho, now, we've got time to burn. I reckon the old folks'll be glad to see us—they'll be ~~delighted~~ without Jeremy." But I reckon you and I'll be mighty near as good as two Jeremys when we get our wind."

Flocks of cinders were soaring and wheeling overhead like red-hot birds, and a bitter, resinous smoke that burnt the eyes swirled across the trail. The roaring front of the fire was some distance off, but isolated blazes were springing up in advance of it as bits of flaming bark fell into the undergrowth like spent rockets. It would not be many minutes before these spread, united and formed a new front.

"Two thousand I said. Did you hear? Two thousand if you get me out of this—now," wheezed Welby. "Don't you see—we can't get on?"

"No, not straight," said Toots. "But we turn hereabouts. Yes, there she is."

By a half dead cedar with an enormous butt the trail swung to the left, and ran off at right angles to its former course. Leading his companion, Toots encouraged him as he would have a frightened child and shortly after they had taken the turn the trail ended in a little compound, or clearing, almost filled by a log-house and its small attendant sheds. A light glowed through the two windows of the house and hens were squawking raucously in their pen. To Welby it was like the abrupt discovery of a main-traveled highway later he had given up all hope of finding his bearings.

(To be continued.)

This picture taken at the agricultural school, Plant City, Fla., includes most of the members of the 1930 Pennsylvania Farmer tour to Florida and Cuba.

The Farm Home

Hints to Hostesses

By MARION COSSITT BRACKIN

ARE you planning a luncheon? I have just had one and am enjoying that little thrill which comes with the knowledge that one is capable of giving a pleasant party, doing all the work herself, and keeping the regular home routine in smooth running order. But if all this is to be done gracefully, you must hold to these two sane rules. Do everything possible the day before the luncheon, and choose recipes you have tried before.

Try any new recipes you may wish to use a week or so before your party. The family will no doubt be delighted. Then you may proceed with your party, having that feeling of assurance which is so helpful to the hostess.

The menu which I selected for my luncheon included oyster patties, potato chips, rolls, pear salad, peas and carrots buttered, celery hearts, cranberry sauce, nut bread sandwiches, drop cakes, brick ice cream, coffee, mints. The pear salad was especially pretty and easy to prepare—and good!

Two halves of pear rested on a bed of lettuce, round side up. A tiny hollow was scooped out of each half pear, and in one hollow was placed a ball of cream cheese which had been rolled in ground English walnuts. On the other hollowed pear half went a red maraschino cherry. A fruit salad dressing was used with this salad.

The patties, cakes and nut bread were made the day before the party. The rolls were bought and reheated in my oven. Chicken would be delicious in the patties instead of oysters, and twenty-four hour salad is delightful. It may be entirely prepared the day before the luncheon. Here is the recipe:

Twenty-Four Hour Salad

One pound almonds (before shelling), one large can crushed pineapple, one-half pound white grapes, one-half pound marshmallows, one small bottle maraschino cherries, one-half pint whipped cream, salt, yolks of four eggs, two tablespoons sugar, one-half cup milk, juice of one lemon.

Scald milk in double boiler. Add beaten egg yolks and lemon juice. Let cool. Prepare fruit, cutting up cherries if desired, and draining pineapple. Add fruit to above mixture. Add whipped cream last. Let stand on ice twenty-four hours.

In the Sick Room

THESE are the days that so many mothers have children recovering from measles, scarlet fever or one of the many children's diseases. When the child is very ill it is easy to care for him. When he is convalescing he demands more attention. The mother quite frequently finds it difficult to think of things to occupy his mind that will keep him as quiet as is necessary for him to regain the best of health.

A mistake is frequently made in trying to think of the unusual. Give him ordinary things and he will entertain himself. Magazines, scissors, paste, boxes, wrapping paper, crayons, pencils, colored wools, plain paper, colored papers and modeling clay are familiar to every child. Though they are ordinary the child will entertain himself by the hour. Mother may have to do some directing, as he has been receiving much attention while sick and will expect some of it continued.

Start him covering a box with colored advertisements and you will be surprised to see how he will progress and how much time it will consume. Tell him father's birthday is next month, sister's is in the summer. Pick out the anniversaries for the family. Let him know how you need his help in planning for these events. Let him plan some jokes for each anniversary and let him plan favors. A little wool doll or animal might be made from

the yarn and wrapped in a number of boxes as a joke.

A number of fortunes may be prophesied by cutting out advertisements and labeling them. A piano advertisement may be labeled musician or piano tuner. Each advertisement will suggest something. These can be placed in envelopes and the child can tell the fortunes of his friends as they call by telling them to select one of the envelopes.

One little three-year-old was amused for almost an hour when she was flat on her back by a bright colored feather. Her mother put a drop of glue on the end of the feather. The child picked the feather from hand to hand and was much amused that she didn't lose it.

A little girl of seven suggested making clay balls, and dropping them on a box as a game. A ball was dropped from the hand about two feet above the box. The second player did likewise. The

The Fireless Cooker

By HEPSY NEFF

IT is more than probable that the success of the fireless cooker a score of years ago brought to our American kitchens its equivalent in gas and electric stoves with double walled ovens, and when the heat reaches a certain temperature the gas may be wholly cut off and the cooking completed on the fireless plan. Perhaps you may yet find the steady, even temperature of the fireless cooker method contributes to the safety of the precious vitamins of our leafy vegetables.

Another gain in fireless cooking is that once action no further attention is needed until the process is finished. Already smaller cooking vessels are on the market, made in sections so that three or four of them placed together make a complete cylinder needing the heat of but one burner and adding to the convenience cooking for a small family. Even all these new conveniences on the market many farm women are within reach of either gas or electricity and for them the return of the fireless cooker is a real advantage.

Briefly, a fireless cooker needs a square box, perhaps two feet square, and plenty of fine soft hay, sheet of tin that will provide a center and keep the hay in place that a ten-inch space is always reserved to use adds to its convenience several smooth halves of brick completes the job. Handleless cooking vessels of the size and shape of a jar are especially convenient. The bricks, bring whatever is to be cooked to the boiling point, place the hot bricks, cover close and with a thick hay cushion before the lid of the box is closed tight.

Such a fireless cooker will give good results as can be had with best insulated ovens on gas or electric stoves. Once a list of vegetables or other foods suited to fireless methods, with the time needed in cooking is in hand the process may go successfully and indefinitely.

It Begins at Home

We have careful thought for the sick and a smile for the off-time guest. But off for our own, the bitter cold. Though we love our own the best.

MANY of us will be honest enough to admit that this poem is true in our own lives. But ought it to be so?

One of my friends has a county judge for his pal. One day he heard a man say to the judge's relatives, "Yes, you can do as please for the judge would not do anything for you." "No," answered the fond cousin, "I not know that judge. He feels that his should know better than to get into court, promises that if they do he will give them maximum punishment."

Our Very Best Vinegar

PATIENCE is sometimes needed in securing vinegar. Once upon a time we had strange experience. We filled our fine gallon cask with cider for vinegar and tried to the usual dose of "mother."

The next fall when we sampled our new vinegar we were surprised to find only tasteless nothing at all like vinegar. Husband thought might as well dump it out, but on second thought he said, "Well, we do not need the cask, stuff will at least keep it from falling into after all, why not wait to empty it till we have the cask?" And we did.

A year later when we wanted to refill the cask we had another surprise. Here were fifty of the very finest tasting and strongest vinegar I had ever sampled. So try patience on your poor vinegar.

BACK HOME

Marguerite Steele McCreary

I WANT to go back home today. I want to go back home; Back where the ploughman's turning up Furrows of shiny loam.

The sun shines warm and bright back home Among the daffodils. About the blue's loosening tips. Along the garden-hills.

The birds are singing sweetly there The robin chirps his love; And from the budding orchard trees Come quaint notes of a dove.

Through the little woods below the barn Again I look to you; I want to go back home today. I want to go back home.

This Week's Special
8 Evergreens \$1.80
Arbutus Spruce, 2 Arborvitae, 2 Austrian Pine, 2 Juniperus Communis.
These trees are 5 to 6 years old, all transplanted in the nursery.
Order NOW for Spring Delivery

Orchid Tree of Himalayas, \$1.15
Crimson Double, the world's most beautiful evergreen. Silvery blue flowers. Tree 1 1/2 feet, each \$1.15; 1 1/2 to 2 feet, each \$1.75.
Magnolia Tree, 1 to 1 1/2 feet, 2 for \$1.15; 1 1/2 to 2 feet, each \$1.75.
Early Hybrid Coral Pink, Nodding, early bloomer, each \$1.10
Glossy, green, beautiful, 2 for \$1.55
Abundant in red, pink and purple large plants, 3 for \$1.50
Hardy Hydrangea, No. 10 Blue
New Wonderful, 3 for \$1.15
Japanese Barberry, low, 2 plants \$1.15
Colorado Blue Spruce, 7 years old, \$1.10
The value of these plants is \$1.50
Special—12 Hardy Perennials, \$1.50
A selection for all summer bloomers. One year plants.
1 Exhibition Chrysanthemum, \$1.15

Favorites for Spring

No. 6770.—Ladies' dress. Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size requires 4 1/2 yards of 35-inch material. For contrasting material 1-3 yard is required. Price 15c or two for 25c.

No. 6367.—Ladies' house frock. Cut in nine sizes: 38, 40, 42, 44, 46, 48, 50, 52 and 54 inches bust measure. A 46-inch size requires 5 1/2 yards of 36-inch material. To face belt and plastron with contrasting material requires 1/2 yard 27 inches wide. Price 15c or two for 25c.

No. 6766.—Ladies' dress. Cut in five sizes: 34, 36, 38, 40 and 42 inches bust measure. A 38-inch size requires 4 1/2 yards of 39-inch material. To finish with bias binding requires 3/4 yard 1 1/2 inches wide. Price 15c or two for 25c.

No. 6658.—Ladies' dress. Cut in five sizes: 34, 36, 38, 40 and 42 inches bust measure. A 38-inch size requires 4 1/2 yards of 39-inch material. For cuffs of contrasting material 1/2 yard 39 inches wide is required. The width of the dress at the lower edge with fullness extended is about 2 1/2 yards. Price 15c or two for 25c.

No. 6733.—Girls' dress. Cut in four sizes: 6 months, 1, 2 and 3 years. A 2-year size with wrist length sleeves requires 1 1/2 yards of 35-inch material. With short sleeves 1 1/4 yards is required. To trim with bias binding requires 2 yards 1 1/2 inches wide. Price 15c or two for 25c.

No. 6771.—Ladies' jacket. Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size requires 3 yards of 39-inch material. To face with contrasting material requires 1/2 yard 39 inches wide cut crosswise. To line the jacket requires 2 1/4 yards 39 inches wide. Price 15c or two for 25c.

HOW TO ORDER

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

IT'S SMART TO BE THRIFTY

WOMEN are becoming keener buyers. Homes are coming to be managed more like business. Thrift, which is the beginning of good management, is winning itself a higher and higher place in every American household. And why shouldn't it? Why shouldn't you, Mrs. Housewife, take advantage of every saving you can? For example, this beautiful Speed Queen aluminum washer! From every angle of comparison—washing efficiency, beauty and guaranteed durability—it offers you all the advantages of the highest priced machines. Yet it is yours at a clear saving of more than \$50! Mail the coupon below for interesting folder describing the SPEED QUEEN and also giving the name of our dealer in your town.

SPEED QUEEN Aluminum Washer

Note These Quality Features:

Large Ballroom Wringer Rolls
Polished Aluminum Tub
(Or Choice of Porcelain Tub)
Submerged Aluminum Agitator
Removable Spleen Ring
Standard Capacity
Double Walls to Keep Water Hot
Self-Oiling Bearings
Enclosed Mechanism
4-Cycle Bridge-Straton Gasoline Engine

For homes having electricity, the SPEED QUEEN is available with a high grade electric motor.

BARLOW & SEELIG MFG. CO.
Ripon, Wisconsin

Gentlemen: Please send me printed literature describing the advantages of the SPEED QUEEN for farm laundry service; and tell me also the name of the nearest SPEED QUEEN dealer.

DUSTS

that stick through wind and rain

*Kolodusts Form a Sticky Film on the Foliage
.... and When Dried Do Not Wash Off*

THIS is one of the important chemical properties of Kolodusts. Though dust-like in their original make-up, Kolodusts form a sticky, gelatinous film upon application to the foliage. This means unusual effectiveness.

A New Dusting Principle

Kolodusts embody a new principle in dusting, winning for them the leadership in crop protection methods. A new and patented chemical process produces the super-active ingredient, Bentonite-Sulphur. It is this ingredient which gives to Kolodusts their extra, high toxicity.

Bentonite-Sulphur is composed of finely divided bentonite into which has been fused fluid sulphur. When applied to the foliage it forms a sticky gelatinous film... a film which later dries and (being a colloid of the irreversible type) "sets" permanently. Thereafter it is "non-wettable" and will not be washed off by prolonged periods of rain.

Here is a permanent protection! Protection which is ten times surer than any other known sulphur dust. Are you protecting your fruit this scientific way? Let us show you how. Write fully today your particular problem to our Service Department.

Amazing New Double Chain Potato Planter

Pays for Itself!

Here is a remarkable new invention—a one-man automatic potato planter with two endless chains—giving greater accuracy, increased yield, and reduced planting cost. No previous experience necessary. Spread in sections. Plants cut or whole seed—single or double row. Cuts in three sizes. Also features. Let us tell you how this new invention pays for itself in increased yield. Make coupon for complete information. Address: Champion Corp., Dept. P.P. 2, Hammond, Indiana.

MARKET PLACE

By W. R. WHITACRE

WE think of the supply of potatoes, cabbage, or any other commodity as consisting of a definite number of bushels or tons. Whenever actual shortage occurs and prices soar far above normal, additional supplies that we have not considered begin to come on the market.

One good illustration of this is being experienced. A shortage of old crop cabbage caused prices to reach \$70 a ton at shipping point and relatively high prices in the cities. There was plenty of new crop cabbage and it would seem that consumers would substitute the new cabbage for old. The housewife has done this, but the largest consumers of old cabbage, the sauerkraut manufacturers, did not. They need the solid white heads and the new green stock does not suit their purposes.

The high prices made it profitable for growers in Holland and Denmark to ship their cabbage across the ocean to the United States. The Holland cabbage is of good quality with exceptionally firm heads. It is selling in Philadelphia at about \$3 per 100-pound crate. The containers used for this imported cabbage vary from the standard wooden crate bound with metal to the picturesque hand woven baskets made of willow shoots.

Popular Colors

This Holland cabbage is of the green or white variety, but in former years most of it that reached this market was of the red variety. Cities with a large German population were good outlets for red cabbage, but it was not generally popular. The preference that the consumer shows for colors in fruits and vegetables is inconsistent. The average buyer will choose a red apple and pay more for it than a yellow or a green one, but when it comes to potatoes he will choose the regular brown or earth color to red ones.

A few weeks ago I mentioned in this column that old crop red potatoes were occasionally offered as new stock. A carload of Bliss Triumph from New Brunswick were since noted, packed in double head barrels. This package is distinctly a Florida container, as none of the other potato sections use it to any extent. The only difference between this barrel and those used in Florida was the fact that saplings were used for hoops instead of the machined kind. The potatoes were small and had been cleaned, but I believe no one was fooled, since they sold at prices well below those received for new potatoes.

A Question of Pruning

How would you prune a peach orchard this spring which has all its fruit buds winter killed? Would you give a light pruning or cut them back hard or would you prune just as if a crop was expected? These trees are in their third crop year. Two years ago the same thing happened but last year there was a full crop. The orchard site is not a very good one and having lost two out of three crops makes it a questionable matter to spend money on pruning and fertilizing. A. L. H.

I WOULD not prune these peach trees with frozen buds hard, now. They should be pruned lightly, if at all. It is quite possible that some of the buds that now seem dead will come through; this has been a common experience in other years. I would defer pruning until after blossoming time. Then, if there is a scattering of blossoms, I would not prune at all, except, perhaps, to take out some wood in the center of the tree. Give these trees an extra dose of nitrate this spring. If, however, no blossoms appear, the trees can be pruned rather heavily. S. W. F.

No Other Implement Could Do This Job

Before the Clark "Cutaway" Bush & Hog Plover was introduced, this piece of land was overgrown with heavy brush, roots, briars, saplings and stumps. Notice what happened after this machine was used to work. Notice how deeply it plowed the soil, how it broke up the brush and tore out the saplings, many of them more than an inch in diameter. No other implement could handle a job like this for no other implement could stand the strain. It would be a wreck.

Thousands of acres of brush land, cut over land, swamps, bogs, hard-baked stony pasture, put under profitable cultivation every year with the Clark "Cutaway" Bush & Hog Plover and Harrow.

And it's a great all-purpose machine, too. It can also be used for any regular disking or plowing job—just the thing for disking corn stubble for plowing and disking orchards, as many growers will tell you.

Fitted with disks of cutlery steel and a heavy forged sharp, forcing puts on an extra sharp, sharp and that won't crack or bend. Unusually guaranteed for 3 years.

Spring Tooth Harrows Out of Date New Type Harrow Replaces Them

Ordinary spring-tooth harrows are going out of Pennsylvania. Their place is being taken by a new harrow more suited to the requirements of Pennsylvania farmers. This new harrow is called the WEED HOG. At first glance it looks like a spring tooth harrow but the likeness ends right there. The WEED HOG, built almost entirely of tempered spring steel, is fitted with long SPIRAL teeth. These teeth may be regulated without weights, to penetrate from a few inches to full FLOW depth. They suck in the ground like plow points, break and rip up the soil and thoroughly mix the humus plow depth. The result is a fine, deep, well-mixed seed bed that potatoes and such crops can't help thriving in.

Yet seed beds now require only the plow and the WEED HOG. And in many cases, the WEED HOG does the entire job alone.

GRASS STUBBLE
Grass stubble may be put in shape for the planter with no other tool but the WEED HOG. It turns up and mixes stubble with the soil and leaves a well worked, deep seed bed.

IN ORCHARDS
The WEED HOG is a great tool to keep orchards in good shape. It breaks up the soil, keeps weeds down and makes the soil.

NO CLOGGING
It's a revelation to watch the WEED HOG work in trash and straw manure, plow depth, without clogging. The reason is that the WEED HOG has no teeth to drag trash while the flexible frame makes it loose.

TEETH WON'T BREAK
It's amazing to see the WEED HOG teeth go down deep and work under and around rocks, stumps, stirring and mixing the rich unworked soil with the top soil. The amazing fact is that the WEED HOG's teeth won't break or bend. THEY'RE GUARANTEED FOR 3 YEARS.

GET THE FACTS—THEY'RE FREE!
There are many more advantages possessed by the WEED HOG, such as its adjustable teeth. Clip coupon for free pamphlet, "The Deep Digger" which shows the WEED HOG in action and tells what farmers who use it say.

Truck Crops

By G. S. WATTS

"IS the Mastodon strawberry profitable and does it bear well?" inquires a reader. Under favorable culture this variety usually produces a crop that is by no means negligible. One of the difficulties in the way of profit is the long drawn out picking season. There are likely to be a great many light pickings, a tedious and expensive matter in comparison with the few very heavy pickings secured from standard varieties. Yet some growers who can sell late summer and fall berries at high prices feel that they are profitable.

Seeds Left from Last Year

"I HAVE a good supply of garden seeds left over. Are they likely to grow if used this spring?" Carrot, onion and parsnip seeds from last year are quite likely to be too weak to make a good stand but I have experienced exceptions to this rule. Most of the other vegetable seeds are good for two or more years. Some when stored in a well ventilated dry place are worth using after five years.

The safe plan, one that may save the expense of buying new seed on the one hand or the waste of labor that goes with planting dead seed on the other hand, is to make simple tests of germination right now. This may be done in a pan of soil or between moist sheets of blotting paper kept on a plate in a warm room.

Raspberries and Strawberries

A READER desires to know where to get complete information on these crops can be secured. Send to The School of Agriculture and Experiment Station, State College, Pa., for Extension Circular No. 106, Strawberry Culture in Pennsylvania. Send to The Office of Information, U. S. Department of Agriculture, Washington, D. C., for Farmers' Bulletins Nos. 887 and 1028, entitled Strawberry Culture and Raspberry Culture.

Asparagus

Will you please tell me when to put salt on the asparagus for weeds and how much? Anna Louise Stevens.

THE custom of applying salt to asparagus beds for either the purpose of fertilizing or to kill weeds has been discontinued by most growers.

I would suggest that you harrow the entire bed very thoroughly as early in the spring as the soil is in condition to work. Then repeat at short intervals as many times as possible before the spears begin to appear or push near enough to the surface to be injured. Keep the cultivator going during the cutting season and as long after as you can get through.

When V-C rides the breeze

OTHER scents mark other seasons, but the smell of fresh turned earth says "Time to plant! Catch that V-C on the breeze?"

V-C sharpens the air of the older countryside with its reminder of planting. On many a faithful old farm V-C is family tradition—and as the newer regions learn that fertilizing pays, V-C goes on to make more friends. Hundreds of thousands of tons of Virginia-Carolina fertilizer are put into the ground each year—to come piling back as early yields, heavy yields, yields rich in market quality; yields that return all their cost and pay handsome profit besides.

Because V-C fertilizer is a wise investment like good seed and good land, because it *makes* money, V-C rides the breeze wherever good farming is practiced. V-C belongs with planting time—it is the spice of Spring.

There is a profitable V-C fertilizer for your crops and soil. If you haven't found it, let us help you now. Write to

A Change of Heart

By FRANK K. RICH

"WHAT'S Eph Bolduc doin' over there next to his house?" asked Deacon Hyne; he shaded his eyes with his hand and peered more closely. "Looks to me 'sif he was clearin' away that reef of rocks and dirt he's been buildin' up there all summer."

"I sh'd guess likely that's jest what he's doin'," Caleb Peaslee responded indifferently, or so it sounded to the deacon.

"Well, what for, in the name of patience?" the deacon demanded crabbedly. "Not that I c'n see what he wanted it there for in the fu'st place; but now it's there I sh'd think he'd let it stay, after he's worked the better part of a month to build it."

Mr. Peaslee pulled his thick nose reflectively and eyed the deacon for a moment.

"I c'n tell you what I think about it," he said, "but it'll be mostly s'posin' and guessin'—not that I think it'll be much out of the facts, jest the same."

The deacon hunched his shoulders, irritated at the deliberate methods of his friend. "Git ahead with it, can't you?" he demanded.

Being thus adjured, Caleb complied agreeably.

"To begin with," he said, "I'm g'oin' to guess it was a kind of spite job. Eph bein' a little given that way; though I hate to lay anything like that to a neighbor. But I can't see it any diff'rent, somehow."

A Better Crop

"Jest below that reef Eph took the trouble to build," he went on, "you know Peter Barlow's land begins—or if you don't know, you c'n see it from here. You c'n tell where by the looks of the land; it's in better tith than Eph's is." The deacon nodded.

"It's like that," Caleb resumed, "on account of Peter bein' a good farmer and workin' on it. He has to, the lard bein' poor and thin, and needin' workin' on to hold what wetness it c'n git—otherwise it'd all dry out and he'd never raise so much as a hill of beans on it. But layin' as it does, down below Eph's land, it got what natural drainage there was off'n Eph's land; so in one way and another Peter's always managed to raise a crop."

"Now, comin' to the guessin', I sh'd say that galled Eph a little, to know what water flowed from his land helped Peter to make a crop; he hatin' to benefit a neighbor by lettin' him have anything, even if it was only the Lord's rainfall that took a natural down-hill course."

Worked the Other Way

"This bein' the case, and s'posin' I'm right about it, my guess is that Eph decided to interfere a little with the course of Nature; so he went to work and built that reef—it amounts to a dam, you might say—with the idea of haltin' that water b'fore it got a chance to help Peter. I d'know where he cal'lated it would go; I s'pose likely he figgered it'd soak into the ground and he'd git rid of it that way. Mebbe it would have if there wa'n't a foot of hard-pan under a clay soil right along there."

"Anyway, he built the dam. If you c'n call it that, and if we'd had a dry summer he'd have been the cause of ruinin' Peter's crop in that field, to say the least. But it turned out to be a pretty wet summer, so Peter made a crop with what rain he got—and Eph's spite didn't work jest as he figgered it would. As a matter of fact," he added contentedly, "it worked right the opposite, and Eph's tryin' to mend it now, when it's too late."

"As I remarked," Caleb went on deliberately, "Eph's soil is clay, and there's hard-pan under it, so the water didn't soak in and disappear, as I s'pose he thought it would. What it done was what water always does—hunted for the low course to flow over; and the dam bein' there to hen-

SCARFF'S SEED CORN
Rack dried by natural process in our modern Seed House. Grown on our own 1400 acre farms. Tested for germination.
CASH—Very early, heavy yielder, deep grain, small cob, medium stalk, excellent feed for stock.

The modern, sure way to kill weeds. Use the Hauck Weed Burner. Burns them down—stems and seeds. Kills them, and half of old methods. Used by farmers, road commissioners, parks, country clubs, golf courses, etc. Write for literature. Hauck Mfg. Co., 118 Tenth St., St. Louis, Mo.

After all, isn't this the Testimonial you're looking for?

We could easily and honestly fill this page with the familiar names and pictures of the celebrated and the great. Most people of prominence use Goodyear Tires as a matter of course, and would be glad to indorse them. But as an attest of Goodyear merit we submit instead another sort of testimonial, packing within its expression the indorsement of literally millions of tire-users like yourself:

What question can you have of tire quality, or performance, or service, or price, that this eloquent fact does not decisively answer? **C.** What is it you seek in a tire that is not also sought, and found in Goodyear Tires in surplus measure, by the millions of Goodyear users throughout the world? **C.** What requirement can you raise of uniformity, dependability, safety, value, that is not assured by this 15-year-old record of matchless popularity? **C.** What mere promise, or claim of excellence, can be successfully held out to you as against this evidence of Goodyear superiority? **C.** These are not superfluous questions; there are still many people who do not use Goodyear Tires, and we are frankly puzzled to know why. **C.** If you do not use them for some reason, we will be sincerely appreciative if you will write and tell us what that reason is.

Old Friends . . . THE BUICK DEALER AND THE USED CAR BUYER

Almost anyone can make a *sale*—but only the merchant who deals fairly and squarely can make a *friend*.

Scores of thousands of used car buyers have given not merely their orders but their friendship to the Buick Dealers in their communities—and come back to buy from them again and again.

The facts which cause these motorists to regard Buick Dealers as old friends will interest you if you are in the market for a used car of any make.

Buick Dealers are permanent dealers. They have held their Buick dealership five, ten, even twenty years. They remain in business, and stand back of the cars they sell.

Buick Dealers are *selected men*. They figure prominently in their communities . . . one was recently appointed to the

cabinet of the President of the United States . . . and all are friendly, responsible, reliable merchants.

Moreover, in motor car selling as in motor car servicing, Buick Dealers dedicate themselves to this main tenet of the Buick creed: to *satisfy the customer*.

Visit your Buick Dealer. See his wide selection of used cars of various makes. And buy with confidence, for he is an expert in transportation, whether you wish to pay \$200 or \$2000.

He will see that you get full value in a used car; he will offer it on the most reasonable terms; he will go the limit to please you that he may number you among his friends.

March 22, 1930.

It flowin' onto Peter's land, it had do the next best; and that happened to be right backward and down into Eph's cellar.

"You know how it's rained this fall, Hyne?" Caleb inquired. "Well, after the heft of his fall work was over, Eph and his wife took a couple of weeks and went visitin' over to Wellham—and while they was gone it rained about every other day. The ground was soaked full and that yard of Eph's looked like a mill-pond. I took notice of it more'n once and my better nature hinted to me that it'd be a kind act to make a break in that dam he'd built so the water c'd drain away and save floodin' his cellar. But I'd guessed so sure whilst he was buildin' it jest what his motives must be that I held my hand and didn't do nothin' to help nor hinder, either way. I thought I'd let himself teach himself a lesson.

Worth the Money

"And he did, Hyne," Caleb went on happily. "though of course this is jest another guess—but I know it's right. I figgered the fu'st thing he'd do when he got home would be to break a hole there and let the water run off—and you c'n see him doin' it!"

"And the next thing he'll do," Caleb said, "will be to pump out his cellar; and the next will be to lug up about twenty dollars worth of Portland cement that the water's ruined—I know it's there because I hauled it for him and helped him put it down cellar myself. And after that he's got better'n a hund'ud bushels of apples to lug up and dry out, so they won't rot, and twice as many p'taters—besides all the other truck there is down there that'll have to be dried out.

"Fifty dollars, work and money, ain't goin' to put him back where he was afore he tried to work a spite," Caleb estimated, "and I'm glad I never done a hand's turn to meddle. If it's the cause of a change of heart in him it's goin' to be worth more'n fifty dollars, the way I look at it!"

"With more'n fifty dollars to who?" the deacon demanded.

"With it to Eph's neighbors," Caleb returned, giving the deacon a glance that showed appreciation of the latter's quickness. "And mebbe it'll be worth a little to Eph next time," he added. "I hope so, anyway."

A 33-Year-Old Horse

TWENTY-SEVEN years ago last month I bought a matched team of fine bay mares from Sheriff Hoover of Somerset county, Pa. I still have one of these mares—Maud—whose picture accompanies this sketch. She will be thirty-three years old this spring.

Maud came from a Kansas ranch and bears a letter "C" branded on her left shoulder. She was one of a carload, bought in Kansas by Mahlon Schrock, a well-known horse dealer of Somerset, Pa.

She has all the best qualities a good horse can have. She is perfectly sound yet, without a blemish. Up to this time she has done her full share of all kinds of farm work.

Ed. J. Friedline.

PENNSYLVANIA FARMER

Here's the Easiest Operated Cultivator

You
ever
saw

EST. 1842
THE CASE Pivot Axle Cultivator almost runs itself. Just sit in the comfortable, adjustable seat, put your feet on the easy working wheel-guide, gang-shift pedals and do a thorough job of corn plowing with a minimum of effort. The gangs shift smoothly on rollers.

Individual depth levers for each gang, a handy spacing lever to adjust distance between gangs and a spring assisted master lever which raises and lowers both gangs at the same time—these are Case features you'll like.

The entire machine is simple in construction—and extra strong to stand continuous work. The famous Case-made, suspension type wheels are quickly changeable for rows from 34 to 44 inches apart.

And here's a time and worry-saver for you—only one greasing a season is necessary because of the special Case magazine wheel box. Easy and comfortable to operate, light on the team.

A complete assortment of standards and shovels is available. Ask your Case dealer to tell you about them. Don't buy a cultivator until you see this remarkable, easily-operated Case machine. Send for interestingly illustrated folder.

J. I. CASE COMPANY, INC., DEPT. 201-C, Racine, Wisconsin

CASE

QUALITY MACHINES
For PROFITABLE FARMING

CASE MANURE SPREADER—easy to load, easy on the team. Spreads evenly, 7 ft. wide. A great crop increaser.

CASE 2-ROW CULTIVATOR saves time and money, and is as easy to operate as a single row. Single or double tongue truck.

CASE SPRING TOOTH HARROW snaps the weeds out by the roots. Easy to pull, lasts for many years.

Quality Preferred

WHEN you go into town on Saturday for the week's buying, how do you go about it? The chances are that your mind is pretty well made-up—not only as to general description of the products you want, but as to the brand names. You'll mention familiar merchandise easily, naturally. Names of advertised goods.

You prefer advertised goods because you know you can depend on them. You save hours of shopping time in a year because you don't need to investigate or examine the things you want. You don't buy on suspicion—you buy with confidence—because you know goods that are consistently advertised must maintain consistent quality. It is ruinous for a manufacturer to turn the spotlight of advertising on an inferior product. And advertisers know it. Hence advertising is a guarantee of dependability.

Read the advertisements regularly. When you go to buy, be informed!

YOU CAN BE SURE THE QUALITY IS "AS REPRESENTED" WHEN YOU BUY ADVERTISED GOODS.

THE YOUNG PEOPLE

A Bunny Bout Party

BIG or little folks will be delighted if you plan a Bunny Bout Party during the Easter season. The party planned here is primarily for children since we have had so many requests for something of this kind, but it can be easily adapted for older ones.

Invitations read:

You are invited to a
Bunny Bout
To be held on
Saturday Afternoon, 4 to 7
At the House of
.....
Please answer.

Invitations may be written on colored cardboard cut egg-shaped.

As the guests arrive the hostess greets them, then seats them in a large ring.

Mother, or a helpful friend, then "enters the ring" and asks: "Would you like me to tell you a story?" Of course the guests will chorus "yes."

"Well, you were invited to a 'Bunny Bout,' weren't you? Now I am going to tell you 'a-bout a bunny'."

"He was an Easter bunny, and this is a fairy tale about him."

"One day, late in April, a small, white, pink-eyed bunny hopped to his mother's side and said, 'Mother, when was I born?' and she answered, 'On Easter Sunday.'"

"Is that why I like Easter eggs so much?" was the next question.

"Perhaps," said his mother, "but you are old enough now to know that your father is the most famous painter of Easter eggs in the whole wide world. He mixes his paints by day, and at night, in his underground studio, paints most of the eggs for the Easter celebration."

"Bunnies from far and near come to his well-known hole, carry away the eggs and hide them throughout the world."

"Every rabbit hole is given some of the loveliest ones, and the rest mere people can have. Some day you must take your father's place, and you should be even better, for you are a real Easter bunny."

"Mother, wouldn't people love to

visit our home down here, and see father's best eggs? And, another thing, wouldn't they be surprised to know that it's in rabbit holes that all the Mother Goose people live when they're not in books?"

"Sh. sh. son, never speak of that, or some one will find it out. Alice half learned our secret when she went to Wonderland, but no one else has ever tried to enter a rabbit's hole."

"Some one may try it again, Mother; what then?"

"Well, we shall wait until it happens," she said.

"Now, children, why don't we try it? Would you like to visit that rabbit's hole?" Would they?

A little work on Mother's part before the party day, and the laundry downstairs has been transformed into Bunnyland, a place fit to thrill the heart of any child.

Visitors must first form in line, single file, and march on tiptoe round and round the house, to music, if possible. As they pass through one room, a queer box office with a painted sign is noticed. "Tickets for the Rabbit's Hole," it says.

Each "admission guarantee" is cut from white mat stock, or letter paper, and decorated with an Easter gummed seal; or, it may be, instead of making the tickets, that little Easter cut-outs are used.

And now, following the leader out through the kitchen, the kiddies go to the top of the stairs, where they stop; for here stands a live bunny policeman, with a stop and go sign in his hand.

A few big paper brass buttons, a badge on father's coat, and a concocted hat makes a frightful policeman of any small boy. As he pockets the tickets, children descend one at a time, for the way is hard and sometimes crooked, as a rabbit's hole should be.

Mail all orders to Party Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Of course, any room can be the "rabbit's hole," though the downstairs idea is most intriguing.

With brown crepe paper the stairs may be closed in on the side, a string or wire run along the top being a sufficient support for the paper if there is no wood to which one may tack. Brown crepe paper is also cut into coarse fringe and hung across the stairs low enough so that a child must bend almost double in order to pass down. Squeals of delight will come from those who are exploring.

And, oh, when the next sight meets the eye! The rabbit's hole itself decked in Easter array! There are real branches, hung with a moss-like shredded paper, violet, yellow, pink and green. Oval balloons in lovely colors sway from overhead branches, resembling huge Easter eggs, and there are "bunnies about" here, there and everywhere.

Mat stock bunnies, peeping through the "bushes"—busy bunnies cut from crepe paper designs and bunnies on parade, just as they come in a fold of crepe paper. Nor are the bunnies alone. Ducks, chickens and many nursery friends are there, too.

When down, the fun begins. An egg hunt must never be omitted from an Easter party. Pass each child a paper bag and say, "Go." Jelly beans, Jordan almonds, to say nothing of the many eggs on the market may be hidden about. A few special, very hard-to-find-eggs "egg" the children on to the best effort.

Sadly now Mother calls attention to one side of the room, part way along which stretches a gray crepe paper wall. Here once sat Humpty-Dumpty, King of Eggs. Children are asked to hunt for his broken pieces. When all are found and put together again, with the aid of an older person, Humpty-Dumpty again smiles from his seat of vantage.

Mother beforehand cuts two large eggs from white mat stock. One is

painted with a face, and then cut into odd-shaped pieces for hiding. The other is reserved so that the discovered pieces may later be pasted to it to form a solid egg.

It does not take the children long to discover that in one corner of the rabbit's hole sits the yellow goose which laid the golden egg. With a little coaxing she will give to each child a golden egg from her basket. Unwrapped, the egg is found to contain a favor. A little rabbit's-foot, lucky charm, perhaps, a bag of marbles, jack-stones or any spring toy.

Mother's arm is really the yellow goose, the hand forming head and bill, while a cambric-covered arm is the long neck. A cardboard bill is arranged to open and shut, which with a bit of practice will work with great success. The rest of Mother is concealed behind a curtain.

The remainder, if any, of the time is filled in with games that all the children know and enjoy. They may, of course, be adapted to Easter.

And now, from a distance, is heard the sound of the supper bell. Needless to say the children scramble up out of the rabbit's hole to the dining room, where the table must have been set by magic, for it was not there when the children passed it last. A paper cover and napkins with Easter figures first claim the attention of the little folks. Looking further, they behold small cups for nuts and candies, covered with crepe paper and decorated with figure cut-outs.

For the jolly centerpiece, there is a large cardboard Easter egg and a bunny.

Supper may be creamed eggs or creamed chicken, lettuce sandwiches, cocoa, ice cream and fancy cakes.

As a finale, a large place of marshmallows is passed, and each child must take one with his teeth. The white powder which gets on the tip of the nose shows that he has now become one of the bunnies.

Little Folks' Corner

Tabby's Adopted Baby

Prize Story
THE pet I am going to tell of is not the queerest pet I ever saw, but was raised in a queer way.

Mother Tabby had two kittens, but one died when one day old. We buried it in a corner of the meadow. Mother Tabby seemed to be grieving for it and was searching everywhere for it, mewing continually.

The next day while Dad was cutting timber he found a nest of baby squirrels and brought one home with him. Of course we children were pleased with our new pet. We were wondering where to keep it when Mother said, "Why not let Mother Tabby have it in place of her dead kitty?"

We were almost afraid she would kill it, but watched Dad put it in the box with her and her baby kitten. She seemed pleased over it and made as much fuss over it as her own baby, so we left it with her.

We named the squirrel Frisky, and the kitten Trixie. They were great playmates, and we had fine times playing with them. We thought it fun when Mother Tabby would bring mice and rats in for the kitten and squirrel. Of course the squirrel didn't eat them and Mother Tabby didn't understand why.

One day Frisky climbed up on a store building in the yard, and Trixie who always tried to follow him, managed in some way, to get up on the building. When they grew tired of playing the squirrel ran down the side of the wall but Trixie couldn't do that. Dad had to put a ladder up and get her.

Frisky was a great favorite with

Sarah Anne is the small daughter of Mrs. Gertrude S. Stewart of the Household Department. This is her royal family—King Robert, Queen Anne, Princess Louise and baby Prince Robert II, all of the Stewart line.

every one. He would sit on a chair-back or sometimes on grandmother's head and eat nuts or bits of bread. Sometimes he would climb to the top of the window and sit there chattering as if in a tree in the woods.

Sometimes he would go to the woods, but always came back. One day a neighbor's cat was nuzzling, and Frisky, who thought all cats friendly, ran down to play with her, was killed and carried home by the cat. When our neighbor told us of it we were sad for we would never love another pet as much as we did Frisky. That same fall Trixie was killed in a trap which my brother had set in the woods. Billie Vannoy, West Virginia.

PASSING EVENTS IN PICTURES

1. Oakland, Calif.—Jack Donestall with his dog, Shanganagh, a Russian wolfhound, believed to be the tallest dog in the world. He measures eight feet when stretched up standing. He has turned down numerous movie offers.

2. Members of the National High School Orchestra who are on a concert tour of the East, play an informal recital for President Hoover at the steps of his office at Washington.

3. The Chief Executive and Senator Arthur Vandenberg of Michigan are seen at the right standing with hared heads as the orchestra plays the National Anthem.

4. Hans Swoboda, 20, recent student of architecture at Muenster, West Phalen, Germany, fitting the spire to his remarkable model of the Cathedral of Cologne, which is built of some 2,500,000 match-sticks.

5. The work took four years, and is called a perfect reproduction of the famous cathedral. It stands ten feet high without the base, and is now on exhibit at the Grand Central Art Galleries, New York.

6. Harvard's leviathan with the Varsity Head Coach Charles J. Whiteside and Freshman Coach Bert Haines instructing the crew as they pull up and down the river on the season's first workout.

7. Los Angeles, Calif.—The huge incandescent light bulb made by General Electric for

a motion picture studio. Ruth Roth and Lolita Vendrell are placing the world's biggest bulb in its reflector. Rated at 6,000,000 beam candlepower this is a 50,000-watt bulb, three feet in diameter and having a three-pound tungsten filament.

8. Los Angeles, Calif.—Photo shows an odd sight in a swimming tank at the Ambassador, which has temporarily been changed to a marine-dynamic laboratory.

Left to right, Racing Pilots L. E. Windolph, M. C. Martin and Al Thompson, going at full speed but standing still. Hawkers attached to their boats are attached to the ingenious recording apparatus which measures the "pull" of the boats.

(Copyright by Underwood & Underwood)

March 22, 1930

(Left) Mr. C. G. Niesley of Mechanicsburg, Pa., (right) with his helper, Mr. A. E. Armstrong, showing potatoes grown with "AA QUALITY" Fertilizer which paid \$250 per acre extra cash last season.

(Below) "I have \$22.75 per acre profit from my investment of \$2.25 per acre in 'AA QUALITY' Fertilizer," writes Mr. Jason Buchanan of Washington, Pa., whose corn, grown with "AA QUALITY" goods, yielded 85 baskets per acre.

\$250 Per Acre EXTRA CASH from Potatoes

MANY farmers have found a way to get real profits from their land. They work no harder than their neighbors; yet, when all expenses are paid, they have extra cash left over to purchase the comforts and conveniences everybody wants.

Take Mr. C. G. Niesley of Mechanicsburg, Pa., for example. Last season Mr. Niesley used "AA QUALITY" Fertilizer on 20 acres of potatoes. His crop yielded 125 bu. more than the average yield in his neighborhood, and will bring \$2 a bushel. That means \$250 extra cash from each acre of potatoes! Under date of Oct. 8, 1929, Mr. Niesley writes:

"I used 'AA QUALITY' this season on my field of 20 acres of winter potatoes, and dug an average of 275 bu. per acre, or about 125 bu. more than the average yield obtained in this section. The season was very dry and naturally all crops, including sugar, were cut short. Owing to the quality of my potato crop I expect to get at least \$2 per bushel."

Another Pennsylvania grower who gets extra cash by using "AA QUALITY" Fer-

tilizer is Mr. Jason Buchanan, of Washington, Pa.

50 Baskets More Corn Per Acre

Last season Mr. Buchanan made a test, planting part of his corn with "AA QUALITY" goods and part without fertilizer. The fertilized corn yielded 85 baskets per acre; the unfertilized, only 35 baskets. He writes:

"The fertilizer cost \$2.25 per acre. So, figuring that I got \$25 per acre extra out of my crop, which was what the 50 extra baskets per acre were worth, I have a profit from my investment of \$22.75 per acre."—Oct. 28, 1929.

Better crops reflect the extra quality of the plant foods used, the painstaking care with which "AA QUALITY" Fertilizers are blended, the longer curing period, the extra remillings. Throughout the growing season the strong healthy growth is apparent—and at harvest time there are big extra yields that mean extra cash. This year try "AA QUALITY" Fertilizers on your crops. There is a dealer near you. See him this week.

Readers' Views

Women Drivers Speak Up

I SAW in your last week's issue a piece headed "Scores Women Drivers." I am a girl driver, have driven a car for six years. I have never run over any one. When I have a flat tire I get out and fix it, I don't stand and wait for a man to come and help. I never smiled at a cop, for I was never stopped by one. I can drive where any man can drive and do it just as well. I know lots of women who are also good drivers.

I am not noted for speeding, but I know some men who are, and I know some men who take more than their half of the road when you meet them.

Women pay the same for their license that men do and I think they have just as much right to drive.

S. R. T.

IN answer to the little item by S. W. I wish to say first I verily believe S. W. is an old bachelor; if not he sure has a bad case of indigestion and needs medical attention. No sane married man would have nerve enough to score the ladies so.

I am a woman driver and can repair my own tires when necessary and can also tinker with the engine enough to make the car run fine if it gets unruly. Ask no odds of any man when I get in trouble, and know lots of female drivers who can do as well, and not swear over the job either. Furthermore, I can drive up to a filling station without knocking things to pieces as I've seen some men doing.

Statistics show that three-fourths of the accidents on the road where so many are killed or wounded are caused by men drivers. And you very seldom hear of a woman trying to drive if she is intoxicated. She has too much sense to try, if foolish enough to get in that condition.

If S. W. would practice smiling before his mirror awhile, then try it on the cops when he is caught speeding maybe he too could get away with the speed act.

I am not an old maid, but a married woman with a husband who does not think the male sex knows it all.

P. M.

THE major portion of women drivers under my observation drive with respect for the law and traffic rules, using care in passing another motorist or pedestrian.

Nine out of ten accidents occur with a man clamping the wheel, and very often drunk.

S. W.'s statement in regard to women drivers giving the cop a smile in passing him to elude apprehension is not absolutely correct, for the cop does not want to halt any one who behaves himself. There probably are vast numbers of men who would if they could buy the cop off, only in a different way.

J. B. S.

Show Circuit Experience

Editor's Note.—Reading that one of the Master Farmers of 1929 cleared over \$3,000 in prize money on Berkshire in the show circuit, a subscriber wrote to ask how it was done. Ray Norman, the Master Farmer in question, answers the reader's questions below.

WE have been following a circuit of fairs several years, usually showing Berkshire hogs. Our best year, and the one referred to in the Pennsylvania Farmer, was in 1924, when we showed at the following fairs: Erie Exposition, Erie, Pa.; Ohio State Fair, Columbus, Ohio; State Fair, Timonium, Md.; Kentucky State Fair, Louisville; Tennessee State Fair, Nashville; Memphis Tri-State Fair, Chattanooga Interstate Fair, Southeastern Exposition, Atlanta, Ga.; Columbus, Ga. Fair, Georgia State Exposition, Macon, Ga., and finished up at the Southern Berkshire Congress Show, Pinehurst, N. C. Our total win-

Standard Engine Company

nings were close to \$4,000, and our expenses were around \$1,000 for three months.

I handled the herd alone, about twenty head, keeping a car fitted up all the time. My wife ran the farm alone, while I was gone, with one helper, who got to drinking and quit, leaving her with a bunch of freshening heifers to break in.

Incidentally, while I was showing in Georgia, my wife showed cattle, sheep, poultry and one sow at our home county fair, hauling them in our own truck and winning grand champion bull, champion sow, and on all along the line.

I do not know of any state fairs that are closed to out of state exhibitors. A few county fairs are, especially in the South. Pennsylvania has a great many county fairs, some of them offering very liberal premiums and under excellent management. Some of them are in all respects equal to other state fairs, and I think it strange that none is as yet designated as a state fair.

A good herd of hogs filling all classes can go out and win good money, but the circuits are harder now than a few years ago. All breeds of hogs have become more uniform, with better feet, and smoother, and all trending toward one type. For a while this type was extreme, but is now reaching a splendid medium.

It requires considerable skill to keep a herd in condition to win week after week. One of the most successful show herds of last season owned in Pennsylvania must have won well over the four thousand mark. There are lots of ups and downs in the game, when the boars won't eat, the pigs have the "flu," and the judge won't see them your way, but when you go in and bring out the purple it is a grand and glorious feeling.

Harford Co., Md. Ray C. Norman.

Technique of Laying Tile

OUR ditchers began laying tile the 21st of February. We put the tile on the ground during freezing weather to avoid trampling the ground in soft weather with teams and horses. In working around a ditch the soil is more or less puddled and the subsoil thrown out is packed. Subsequent freezing weather will break up this effect and leave the ground friable and easily worked. When the work is done late the ground along the line of the ditch remains cloddy and works badly all summer.

The workmen shave top soil from the sides into the ditch to firm the tile, holding them in place at once. We follow them, caving in the top soil with a spade from each side, so our trenches are practically filled with the looser soil from the first foot of depth. Later in the spring when dry the subsoil is thrown onto the line of the ditch, but remains near the top of the ground.

We require some perceptible opening at every joint. Most tile that we get are not exactly perfect and this often permits a crescent-shaped opening around the lower half of the joint. If the tile are true and inclined to lie too close at the joints they are spaced about the thickness of a penny. The deeper the tile are buried, the more free we wish the joints.

If the tile sizz when laid in a damp ditch they are porous and sure to expand some, in which case we require careful observation and more spacing if the expansion tends to close the joints. We have examined tile laid in dry ditches after a ditching machine in summer and found joints next thing to waterbound.

We always engage the best ditcher we know. As soon as the tile is on the ground Tom, Dick and Harry begin to call and ask for the job; but we never put any tile on the ground until we have first made a deal with a dependable grader. This costs us a bit more than ordinary diggers. Even with the best of ditchers we make a point to visit the job several times a day.

G. P. W.

MOVE SOUTH for profit and pleasure Let us tell you about it

The great Central South served by this Railroad offers many ideal locations for farming where you can live happier and save more money. Farm lands are productive and may be had at prices very much below those in the neighborhood in which you are now living.

Because of mild weather conditions, there is little idle time for southern farmers, every day in the year being a productive one, and, in many sections, crops ripening and going to market at all seasons and at good prices and profits.

There is plenty of water, plenty of labor, churches, good schools, good roads—flowers,

sunshine, and happiness for every member of your family. Use the coupon below and let us give you information about how you, as other northern farmers have done, can prosper in the South. We make no charge for this information or help—simply indicate the section, or sections, about which you would like information and specify the type of farming in which you are most interested.

The photograph at the top of this advertisement shows a dairy herd on the farm of B. B. Commer, Jr., of Sylacauga, Alabama.

The second picture is of a fine tobacco field in Henry County, Tennessee, and the one below shows part of a very profitable watermelon patch, grown near Graceville, Florida.

On a five year average of all states in the Union, Alabama and Mississippi tie for top mark of income on investment in farming, with return of 49c on each dollar invested. Louisiana is next, with 44c, and Georgia fourth, with 41c. Illinois and Iowa show a return of 13c. In other words, \$1.00 invested in Mississippi or Alabama farms and equipment produces the same return as \$4.00 invested in Illinois or Iowa.

This Railroad does not offer an acre of land for sale. There is no charge for this information, now or ever, and our agricultural experts will help you to find the farm you want, at the price you want to pay, and render you every possible assistance in locating and in building a profitable business.

LOUISVILLE & NASHVILLE R. R.

The Enclosed Engine That Oils Itself

A Worker That Can't Be "Hired Away" From You

If you could get a "chore time" worker for just a few cents a day, that you could always depend upon to pump the water, shell and grind the corn, saw the wood, turn the washing machine, churn and separate the milk, all of your neighbors would be trying to hire him away from you.

You can get that steady worker in the John Deere Gas Engine. It will do all of those jobs—save you money and more time for other work, besides taking a big load off the womenfolk's shoulders. And it will stay with you, year after year.

The John Deere is the enclosed engine that oils itself. Lubrication starts the moment the engine starts—just as in your automobile.

All vital parts are completely enclosed—protected from dust, dirt and weather. No exposed parts for clothes to catch on. Safe and easy to operate.

Three sizes: 1-1/2-, 3-, and 6-H. P.

Ideal Pumping Equipment

The John Deere Direct Drive Pumping outfit is a portable piece of equipment for any farm where a constant supply of water is of vital importance. This compact, self-oiling unit operates continuously without watching. Every ounce of engine power is coupled to the pump. No belts, gears or chains for stock to get into. Safe, dependable and economical.

See this time and labor saving equipment at your John Deere dealer's. Write John Deere, Moline, Ill., for booklet HW-736

How to Pick An Ensilage Cutter

THE man who knows machinery checks an ensilage cutter point by point as a good dairy judge scores a cow. Try scoring any cutter that interests you on these ten counts:

1. How big is the throat opening?
2. Has it enough fans to keep a STEADY stream going up the pipe?
3. Are the fan plates replaceable?
4. Is there any adjustment for the lower casing to take care of fan wear?
5. How fast does the cutter run?
6. Does it have a non-slip pulley?
7. What capacity is guaranteed and what capacity do Agricultural College tests show?
8. Is there anything to keep strings from winding on the shaft?
9. Is there anything to keep corn from packing back of the knives?
10. Where can I get repairs in a hurry?

Papec is the only cutter that can score a full 10 points on every count.

See your dealer or write us for a copy of the latest Papec Catalog.

Clip this ad and save it for future reference.

Farmer's Business Letter

THE grain markets continued to sag this week in spite of rather heavy buying at times by agencies of the Farm Board. Official statements are lacking, but it is estimated that the agencies of the Board now own about 40,000,000 bushels of wheat, and Mr. Legge has said that they might increase their holdings to 100,000,000 before the end of the crop season July 1. He has also issued a statement warning farmers that the Board has no intention of buying huge quantities of wheat with a view to removing the surplus unless farmers cooperate by reducing acreage. This is taken as a threat and tends to create resentment, for most farmers cannot afford to take the chance of letting acres lie idle.

In the meantime the Canadian situation is becoming worse rather than better. Canada is still holding almost the entire 224,000,000 bushels of wheat it had in storage November 30. The opinion is held in Canada that only crop failure or reduced acreage can relieve the situation, with not much prospect of the latter because the wheat growers of the prairie provinces are hard up and need a crop.

Weakness in Hogs
The hog market was weak and there was a sharp drop in prices at the close of the week. Average price for the week, however, showed a decline of only 5 cents from last week's average of \$10.55. A year ago the average was \$11.60.

The trade is uncertain about future hog prices, which probably explains light trading in the futures market. Only about twenty trades were made all week. Light hogs for April delivery ranged in the futures market from \$11.35 to \$11.30, for May delivery from \$10.85 to \$11.30, and for September delivery \$11.30; heavy hogs for April delivery sold at \$10 to \$10.50. Trading was at a lower level at the close of the week than early in the week.

Cattle Trade
The cattle market closed this week 50 cents to \$1 below the high time last week, all classes participating in the decline. The run, at 38,900, was moderate for the time of year. Demand for beef continued weak, and it doesn't take much to overload the market.

Top steers brought \$15.50 this week, that price being paid for some strictly choice bullocks averaging 1,730 lbs. They brought \$268.15 apiece. Yearlings sold up to \$15.25. Average price of steers was \$12.65 this week, against \$12.55 last week, \$12.85 a year ago, and \$12.75 two years ago.

Lambs Steady
Receipts of sheep and lambs were again liberal—87,000 here, against 77,000 a year ago and 56,000 two years ago. The market held well. Average price of lambs was \$10.60, against \$10.45 last week and \$17.05 a year ago. Some western feeders report that they are losing \$6 a lamb.

Top lambs brought \$11.65 this week against \$11.35 last week. Plenty of lambs are still to come, and there is nothing in sight to promise improvement in the market.

LIVESTOCK

PITTSBURGH

Cattle

Receipts continue light, only 25 carloads appearing for Monday's trade. Demand for steers was anything but urgent, slaughterers saying that cattle bought on western markets were cheaper than those bought here lately. All bids for good fat steers were lower and they finally sold at a decline of about a quarter. Very few were required to command \$13. Good fleshy steers with weight enough brought \$12.50@12.75, and useful killers \$12@12.25. Ordinary light butcher steers were scarce and firmly held, selling at about former prices, \$11@11.50 for only fair to decent butchers kind, a few other light steers up to \$12 or a little more. A few ordinary light steers brought \$10.50@10.75, some at the latter price going out to graze. One load of weighty and well wintered West Virginia steers brought \$12 for grading. Heifers were scarce and steady. Fat cows showed little change, few good enough to sell above \$8.50. Canners sold mainly around \$5. Bulls were a little stronger, with good butcher kind \$9@9.25 and ordinary bolognas \$8@8.25. One choice young butcher bull of 1,270 lbs. brought \$10.50.

Prime fat steers \$13.00@13.25
Choice steers, 1,500 lbs. or over \$12.50@12.75
Good to choice, do. \$12.00@12.25
Fair to good, do. \$11.50@12.00
Plain heavy steers \$11.50@12.00
Choice handy-weight steers \$12.75@13.00
Good butcher steers, 1,000 to 1,150 lbs. \$12.25@12.50
Fair to good, do. \$11.75@12.25
Ordinary to fair, do. \$11.00@11.50
Common, do. \$10.50@11.00
Good light butcher steers \$12.00@12.25
Fair to good light steers \$11.50@12.00
Common to medium, do. \$10.50@11.25
Inferior light steers \$10.00@11.00
Feeder calves, 600 to 700 lbs. Nominal
Stockers Nominal
Choice fat heifers \$11.00@11.25
Good to choice heifers \$10.50@11.00
Fair to good heifers \$10.00@10.50
Common to fair heifers \$9.50@10.00
Choice fat cows \$7.50@9.00
Good to choice fat cows \$7.00@8.25
Fair to good cows \$6.50@7.50
Fair to good cow \$5.50@6.50
Canners \$4.50@5.25
Fresh cows, calf at side \$6.00@10.00
Choice heavy bul. \$9.00@9.25
Choice handy butcher bul. \$9.00@9.25
Good handy bul. \$8.50@9.00
Fair to good bul. \$8.00@8.50
Common to fair bul. \$7.50@8.00
Inferior bul. \$6.50@7.50

Hogs

Last week's hog market slumped in the face of light receipts and a fair demand for hog meats, top hogs closing at \$11.25 here. Monday's supply was light, around 25,000 head, and the market was a little higher at \$11.35 but buyers showed no improvement. Western markets offered 300-pound hogs at \$9.50@9.75 and extreme weights here might not bring quotations. Some good hogs of close to 300 lbs. brought \$10.35 but not many of such weights appeared and few were wanted. Those of around 250 lbs. would sell at \$10.65@10.75. Heavy mixed lots ranged downward from \$11. Bulk of the light hogs went at \$11, a few \$11.25 and the best of them went in with heavy heavy weights. Good ones brought \$9.25 and some heavy stags \$9.75.

Sheep and Lambs
Most of the 16 carloads on sale on Monday were clipped. The market lacked snap and sheep were about steady while lambs were lower. Best clipped handy wethers brought \$6.25 and that was generally regarded as the basis for sheep. Woolled wethers were nominally \$7@7.25. Best woolled lambs brought \$11 per cwt. and looked cheaper than clipped lambs, but best of which sold at \$10. Bulk of the supply consisted of clipped lambs, which ranged from \$7 to \$10 per cwt., the latter generally \$7@8. A few spring lambs and some good ones were offered. Choice wethers, good ones, would probably command more than how much nobody knows.

Clipped
Good to best wethers \$6.00@6.25
Good mixed \$5.00@5.50
Fair to good, do. \$4.00@4.50
Common to fair \$3.00@3.50
Inferior sheep \$2.50@3.00
Good to best lambs \$5.00@5.50
Medium lambs \$4.00@4.50
Culls and common \$3.00@3.50
Woolled sheep \$4.00@4.50
Woolled lambs \$3.00@3.50

Monday's supply was about 60,000 head. Real calves went at \$15 per cwt., onds at \$11@12.50 and others at \$7@9.

Philadelphia Produce Review

THE Philadelphia egg market opened with somewhat higher prices. These were probably due in part to firmer western advices. Some questionable stock was offered at slight concessions but the average quality stock was held firm. Supplies were fairly liberal and under the satisfactory demand arrivals were closely cleared. Buying interest slackened slightly on Tuesday and advances were checked. As the week progressed slight accumulations were noticeable but not burdensome.

The egg market in New York was irregular with liberal receipts and a free movement into storage. Offerings of nearby white eggs were ample with some good marks of New Jersey eggs available at 32c. Nearby white eggs ranged from 25¢@32¢ per dozen, brown eggs from 27¢@31¢ and mixed colors from 22¢@29¢.

Butter and Poultry

The butter market was firm during the week with receivers reporting a fairly satisfactory clearance of goods. As the result of this closer clearance of arrivals prices were generally one cent higher than at the close of the previous week; further advances of one-half cent to a cent were reported later in the week. Trading was more active with buyers operating with more confidence. The demand for storage butter which has been negligible improved and considerable storage butter changed hands. The southern crop is reported as making good progress with favorable growing conditions.

W. R. W.

Two Weeks of June in February

(Continued from page 8.)

nation's capital. It was Mr. Phillips of the Seaboard whose careful work for weeks before the tour started was largely responsible for our smooth-running schedule.

I wish I could paint a life-like word picture of the 132 congenial members of the tour party proper, of the railroad officials who rode with us or met us along the line, of our good friends the Pullman conductor and the dining-car stewards, of the good-natured Pullman porters and dining-car waiters, and of the great host of hospitable people who met us wherever we went, carried us in their automobiles and asked us to "come again and stay longer."

I should like to tell about the country we visited, where nearly everything was new and strange to us northerners. "It gets more different and more interesting every day," was a common remark.

And I wish I might describe the good times we had on the train. There are trouble-makers in the world, I suppose, but none of them was on the Pennsylvania Farmer Special. Every-one was friendly with everyone else.

That did more to make the trip pleasant than any amount of interesting scenery. Moreover, the members of our party made friends, created a good impression and won respect wherever they went. If the tour was a success, they themselves made it so.

It would be easy to write columns more about our tour party and the things we saw and heard and did. But, as I said last week, this is written at the request of tour members who wanted to make their stay-at-home friends feel bad about the good time they missed. If the stay-at-homes are miserable enough. But if they want more punishment they can get it by coming to the reunion the tour party already is planning to hold at Gettysburg next summer.

The members of the tour party were:

W. L. Barnhart, Sr.; Frank C. Bau-croft and wife; J. L. J. Bailey and wife; J. B. Elcker and wife; John Biedenhapp; Solomon Billman and wife; S. H. Bishop; Mrs. Margaret Black; A. S. Blackburn; Peter R. Briggs; Mrs. H. P. Bowser; Wm. T. Bunting and wife; Warren K. Clouser and wife; J. E.

brought 27¢@30¢ per pound, chickens 26¢@27¢, broilers 25¢@45¢ and capons 37¢@40¢. Dressed hot-house broilers were in light supply and fancy stock sold readily. Much of the stock was poorly graded and unattractive sold slowly at low figures.

Pennsylvania, New Jersey, Maryland and Delaware apples arriving by truck in Philadelphia were moderate in supply. The best Romans sold at \$1.25@1.25 per bushel, Stayman at \$2@2.50, Yorks, Nero and Black Twig at \$1.25@2 and Ben Davis at \$1@1.50. Poorer stock of all varieties sold as low as 75c. It is becoming more difficult for buyers to get stock free from scald.

Potatoes Tend Lower

Prices of potatoes tended lower in the East this last week. Philadelphia which led the Eastern markets the previous week experienced a decided slump. The better condition of the market at that time encouraged dealers and considerable high priced stock was purchased f. o. b. This stock arriving this week on an unsettled market forced prices lower. Shipments from Maine, Minnesota and Wisconsin were active.

Prices generally declined 5 cents to 15 cents per 100 pounds at both city markets and shipping points. Growers in the Rochester district of New York were receiving generally \$1 per bushel, compared with the prevailing range of \$1.10 early in the month. The southern crop is reported as making good progress with favorable growing conditions.

W. R. W.

60 BUSHELS more potatoes per acre by INSTANTANEOUS dip seed treatment

In Maryland, Daniel Leasure increased his potato yield 60 bushels per acre by Semesan Bel seed treatment.

Semesan Bel saves time and labor Controls seed-borne diseases Improves quality and yield

It costs just as much to plow, harrow, plant and cultivate an acre that yields a paying crop of potatoes as it does for one which yields a poor crop. In either case you must plant the same quantity of seed per acre, and put in the same amount of labor in your field. So anything you can do to increase your yield will also increase your profit at harvest.

Daniel Leasure, of Maryland, wanted a bigger potato yield—and got it. He knew what to do. By treating his seed potatoes the quick, easy way with Du Bay Semesan Bel he not only prevented seed-borne disease losses, but actually increased his yield 60 bushels per acre.

Easy dip treatment

Besides being dangerous to sprouted seed potatoes, old-fashioned liquid soak treatments mean a waste of time and labor. When these messy methods are used to control potato diseases the seed must be soaked from an hour and a half to two hours.

Semesan Bel now reduces the tedious two hour job of treating seed to practically nothing. All you do is dip the seed potatoes the quick, easy way with Du Bay Semesan Bel. One man alone can easily treat as much as 400 bushels of seed potatoes a day by this quick, modern method.

Treatment increases yield

Because Semesan Bel destroys scab, rhizoctonia and black leg organisms on the surface of seed potatoes and thus stops development of diseases, this quick dip treatment increases yields and improves crop quality.

Carl E. Randolph writes from Maine:

Truslow Chicks

—The Product of Our 48 Years
of Experience in BREEDING

Baby chick delivery time is here. Order your "Kerlin-Quality" chicks
right now—and make big egg money early next fall and all winter long.
No farm investment pays so well as "Kerlin-Quality" chicks.

Mr. Eric Johnson, Beloit, Wisc., writes: "The chicks I got from you last
April were the finest bunch I have ever turned into coops. The pullets
developed into five and six pound birds, and very high in vitality. I just
started keeping records Nov. 1, and from 900
unculled pullets (raised from 2,000 chicks), I sold
eggs in Nov. and Dec. for \$1061.38. Feed cost
\$205.00. Net profit \$856.38.

"We are building a 200-foot laying house, two
stories high, which will be filled with 'Kerlin-Qual-
ity' Layers in 1930-31. I am sending you an order
for 2,400 chicks this week, and will order more a
little bit later. You sure are a square shooter and
a fine man to do business with."

We have just discovered a method which pro-
duces the most perfect chicks. This is the result
of years of experiments. No milk—no acid—no
sugar. In fact, the chicks are born with a perfect
digestive system. Send 10c for your copy.

Successful baking is something more than avoiding failures

When you avoid baking failures you're halfway to real baking success—but only halfway. There's something else, just as necessary.

Of course, avoiding failures is important—so important that Pillsbury's Best Flour is constantly tested, by daily baking, by every scientific method known, to make sure that it will never fail you—that every sack will work perfectly for any baking purpose, bread, biscuits or pastry.

But there's something else that deserves consideration—a kind of success that is more than a matter of dodging failures. Haven't you noticed sometimes that one baked food tastes just a little better than another—although there's no particular difference in their appearance? That's the secret of this higher type of baking success—*perfect flavor*, the mark of the real artist. There's no mystery about it. Simply choose

ingredients (flavorings, shortening, etc.) with greatest care, and use a flour that is rich as well as dependable—Pillsbury's Best. For Pillsbury baking chemists have discovered one secret of finer flavor. They have found that certain blends of wheat make a richer flour—and that foods baked from this richer flour have a better flavor. Pillsbury's Best is made only from this carefully selected, plump, full-flavored wheat. It gives you double value—dependability, plus finer flavor.

Here is something really worth having—the certainty that your flour will never cause a failure, and, more than that, the knowledge that everything you bake will have that delicate, unmistakably richer flavor that is the mark of really fine baking. All good grocers have Pillsbury's Best Flour—ask for it by name—for better flavor and more certain success in all your baking!

LEMON MERINGUE PIE
1½ cups boiling water 3 eggs
1½ cups sugar Juice of 2 lemons
5 tablespoons Pillsbury's Best Flour ½ teaspoon salt
1 tablespoon butter Grated rind of half a lemon
Mix the Pillsbury's Best Flour and sugar together, and add to the boiling water, stirring constantly until the mixture thickens. Add the butter, salt, lemon juice and rind, and pour the mixture into the egg yolks, well beaten. Return to the heat and cook for two minutes. Transfer to a baked pie shell and cover with a meringue made by beating the egg whites stiff together with three tablespoons of powdered sugar and one-fourth teaspoon of lemon extract. Bake in a slow oven, 325 degrees F., until the meringue is a golden brown—about ten minutes.

HOT WATER PIE CRUST
1 cup Pillsbury's Best Flour 5 tablespoons shortening
1½ teaspoon salt 3 tablespoons boiling water
¼ teaspoon baking powder

Sift the dry ingredients together and cut in the shortening with a knife, keeping the mixture flaky. Add the boiling water, stirring quickly and lightly together. Transfer to a board dusted lightly with Pillsbury's Best Flour and roll to one-eighth inch thickness. Fit over a pie plate, prick the surface with a fork to allow the air to escape, and bake in a hot oven, 400 degrees F., about twelve minutes.

Recipe furnished by Mrs. Ida Bailey Allen, President of the National Radio Home-Makers' Club.

Why waste two hours doing a TEN-SECOND JOB?

Just
DIP...

and
PLANT

Treat seed potatoes with Semesan Bel
Saves time and labor
Increases yields

Time spent treating seed potatoes by old-fashioned, mussy soak methods to control surface seed-borne diseases, is time wasted. When such treatment methods are used, every lot of seed must be soaked from an hour and a half to two hours. The job is slow and tiresome. Sometimes severe seed injury occurs during soaking.

Now you can treat your seed potatoes instantly, easily, safely! By using Du Bay Semesan Bel, the instantaneous dip disinfectant, you can do the old two-hour job of seed treatment in 10 seconds or less. Just dip your seed potatoes, and plant. That is all! No soaking, no risk of seed injury, and no costly equipment necessary. With this quick method, one man alone can easily treat as much as 400 bushels of seed potatoes a day.

Increases yield per acre

Because Semesan Bel dip treatment of seed potatoes destroys surface-borne infections of Rhizoctonia, scab and black leg, better field stands and bigger yields result from seed which has been given this protection.

A report in the January (1930) issue of *Phytopathology* shows that Semesan Bel treatment of clean seed produced an increase of 58.2 bushels per acre in 1928 Maine tests. When tested on diseased seed during 1926 and 1927, this instantaneous dip gave an average yield increase of 53.6 bushels per acre.

Practical growers also report highly profitable increases through Semesan Bel seed treatment. Daniel Leasure, a Mary-

land farmer, obtained a yield increase of 60 bushels an acre. From Maine, A. H. Christie & Son report that their Semesan Bel treated seed outyielded untreated seed 5 barrels per acre and produced 7 barrels more per acre than corrosive sublimate treated seed.

In New York tests, Semesan Bel treatment gave a yield increase of 20% on early potatoes and an increase of 15% on late potatoes.

Certified seed needs treatment

Do not think seed is completely free of disease, because it is certified. Dr. Wm. H. Martin, of the New Jersey Experiment Station, said in the *American Produce Grower* that there is no state which does not permit at least 10% of scab and Rhizoctonia in certified seed.

By treating all your seed with Semesan Bel, you can guard your crop against these diseases.

Improves sweet potato yields

Semesan Bel treatment also improves sweet potato yields by controlling surface-borne black rot and scurf or soil stain. Just treat the seed and dip the sprouts before setting.

Economical, easy treatment

One pound of Semesan Bel will treat from 16 bushels of small seed to 22 bushels of large seed potatoes. So it costs little when applied easily according to simple directions. Ask your dealer for the free new Semesan Bel pamphlet. Or write Bayer-Semesan Company, Inc., 105 Hudson St., New York, N. Y.

Farm Facts and Fancies

By ALVA AGEE

I HAVE not seen the article, to which a subscriber refers, in which a director of the St. Louis livestock exchange suggests to Chairman Legge, of the Federal Farm Board, that the farmers be financed to manufacture farm machinery, and to distribute at cost, and to cut out all middlemen. I don't know whether the suggestion was made seriously or only as a drive at the manufacturing corporation Mr. Legge built up. Be that as it may, it is not in line with the thought of many that the farmers are wards of the nation? Do we really like any such relationship?

The government rightly controls the nation's credit machinery, and it is its duty to provide credit facilities, as far as a sound business basis exists, for all. Making sure that every industry, including agriculture, has all the credit it can safely use, and being concerned in respect to markets, as it is for manufacturing interests, its only further business is to see that fair play prevails. That is a broad field and the government doesn't get all of it covered, but farmers are not wards among a free people. All that is wanted is a square deal and not anything that smacks of charity or guardianship. The government will have plenty to do if it insures a square deal for all its people.

Protection of Rights

We shall hear much of the United States Supreme Court during President Hoover's term of office. It probably will come about that a majority of the judges in this court will be appointed by him. Resting upon the Constitution, we have three coordinate bodies in our national government.

The Congress legislates, the Supreme Court decides what is constitutional and what is not, and the President is the executive. He appoints these judges with the assent of the senators, and then the judges, who are appointed for life, are our protection that no constitutional liberties are taken from us.

Some conservative senators would like to see men of conservative tendencies named for the bench, and some liberals would like to have more liberals as justices of the Supreme Court. The question was not one of honor and ability, in the case of Mr. Hughes, but of natural bent and attitude, and doubtless it will be so in the case of all others whose names are sent in for confirmation, as time goes along.

Levying Taxes

A thing may be constitutional and legal and at the same time unjust. The various states retained their right to levy taxes in many different ways. Where I now am living I pay only one mill tax on the dollar on money in bank at the taxing date, two mills on the value of securities, and between six and seven cents on each dollar of appraisal of real estate and household goods. The appraisal is supposed to be only a half of market value, but it is much higher in many instances. This peculiar state of affairs comes about through the desire of the state to attract wealthy men and lead them to declare citizenship in the state.

Some people urge the need of uniform taxing laws for all the states, but the United States has only the rights that the individual states surrendered when the Constitution was adopted, and as it has been amended from time to time. It is idle to expect a state to give up its present right to do as it pleases in respect to taxation, except as certain surrendered rights are concerned. Uniformity among the states appears an impossibility. We cannot achieve fairness in taxation, and there is a wide margin for improvement between a rate

of one mill and a rate of sixty or, say, thirty to forty.

Dependable Branding

A marketing official writes: agree with you that in the case of potatoes there should be some way of indicating the percentages of different sizes in the container on tag or container itself. However, it is difficult to work out a practical method of doing this. I am wondering if the solution of this problem is going to come when we adopt branded consumer-sized packages.

It is easy to criticize, and I think that most criticism is partly formed. We have earnest officials trying to work out these grading and branding problems, and a layman does not appreciate all the difficulties. On the other hand, the consumer does not like to see the brand "U. S. No. 1" on a container of potatoes that were not fitted by nature to supply a demand for a number one article, and he thinks something should be done about it. A statement regarding sizes, as suggested by our correspondent, would be helpful to buyers but the difficulty lies deeper.

A practical man knows that a lot of undersized and unattractive potatoes can be put over a grader, and diseased tubers removed by hand, to a product secured that can get by far as regulations go, and yet is from being attractive to the consumer when he empties the container. Present regulations are right enough for a crop of good potatoes, and a crop of poor potatoes needs branding from any effort to quality as "No. 1" stock.

Now, I may be told that I am talking about something that is impracticable, and possibly I am. Could brand "U. S. No. 1" be confined to use on good stock, while graded potatoes that lacked size and smoothness as determined by an inspector's examination, be limited to the use of some other brand? There should be some way of making "No. 1" what the man on the street supplies that it means.

A Welcome Book

Dr. Charles E. Thorne, whose during monument is the Ohio Experiment Station, is the author of a book of great value to practical farmers and students of soil fertility problems. Its title is "The Maintenance of Soil Fertility," and it is an interpretation of the facts regarding the that experiment stations have developed.

We needed a summing up of truth, with the right emphasis on part, that Doctor Thorne possesses the training and experience to give. There would have been a serious if this book had not been written. Usually careful, cautious and conservative, the author speaks with clearness and decision because his facts lead him to know. "The Maintenance of Soil Fertility" is published by Orange Judd Company, New York City.

Bulletin on Whitewash

In a great many cases sheds, houses and fences are made of stone or rough lumber. While it is difficult to paint these with oil paint they can be whitewashed quickly and at small cost.

The uses for whitewash are many and it is best to apply the material especially developed for each particular condition. In order to assist the public to procure the best products, the National Lime Association, of Washington, D. C., has prepared Bulletin No. 304-B entitled, "Whitewash and Cold Water Paint," which contains eleven different mixtures under varying conditions and be sent to any one on request.

The Mystery of a Seed

SEEDS are unique in the plant world. When a plant has completed its life history and is about ready to die it forms a minute plant and tucks it away in the seed accompanied by sufficient food to start its germination and to support the little plant until roots and leaves are grown sufficiently to prepare additional food for the continuation of its growth and development into a mature plant.

If one will consider the great potentialities contained in the tiny seed and the importance of planting that seed in good, fertile soil with proper moisture and temperature conditions so that those potentialities will be fully developed he cannot fail to see that both factors, inheritance and environment, are absolutely essential.

Change the soil, the water, the temperature and the light conditions as you will and still the tiny acorn will grow into a kind of tree that every one will recognize as an oak. Never will an acorn make a mistake and produce an elm, a pine, or maple tree.

After Forty Years

Fifty years ago Doctor Beal of the Michigan Agricultural College buried twenty-two different kinds of seeds. These seeds were placed in uncorked bottles of moist sand. The bottles were then buried twenty inches deep with the mouth of the bottle turned downward so that they would not fill with water and would still retain some moisture. After they had been buried 40 years he found that ten of the twenty-two different kinds of seeds retained their vitality and grew when placed under favorable conditions for germination.

On the other hand many seeds may lose their vitality soon after they have matured. Their length of life depends on the kind of seed coat, the conditions under which they matured and especially upon the storage conditions. If seeds mature in moist weather and are not properly dried before being stored, the little plant may mold or freeze if the temperature is low, or may even begin to grow before being planted.

The little plant within the seed is so tender and so easily damaged that many things may happen which will destroy it. In nature provision has been made for this great mortality by producing seeds in great abundance.

Necessary Factors

One cannot determine the quality of seeds by their appearance. The seed may look fine but something may have happened to kill the young plant within. Therefore farmers and gardeners should select and test all seeds with great care. If ten out of every one hundred seeds planted are bad, then one can expect only a ninety per cent stand and, other factors being favorable, only a ninety per cent yield.

With our leading crop like corn one scarcely realize that only a slight improvement in the quality of the seed planted will mean an enormous aggregate increase in the crop produced.

Let us remember that one of the factors necessary to have a fine flower and vegetable garden and to raise good field crop is the planting of seeds of good quality. Begin now to make your selections and to test the seeds. This factor is under the control of the gardener and the farmer. The second factor, that of favorable environment, is not always so easy to control. We are sometimes obliged to plant seeds in soil that is not very fertile, nor do we have perfect control over the amount of moisture, the degree of temperature and the intensity of the sunshine.

In addition to the above factors, let us remember that the soil contains many of these long-lived weed seeds. Some of these are going to grow in your garden next summer. Clean cultivation will assist your flowers and vegetables and field crops very much in their struggle for existence against the hardy weeds.

Please Mention Pennsylvania Farmer When Writing to Advertisers

Your soil is like your bank account

YOU CAN'T take richness out of your soil year after year and expect it to continue producing good crops. Like the bank in town, you've got to put money in before you can draw it out. Many sections of the United States are already showing the characteristics of worn-out soils such as decreasing yields, "nubbin" quality, delayed maturity and frost danger.

In such cases the nitrogen, phosphorus, and potassium necessary for big yields have gone to market with the crops. This results in higher producing costs and increases the odds against you for each succeeding crop.

The soil losses of your fields must be replaced. You should feed your soils just as you feed your livestock—by an ample and balanced ration. The right kind of fertilizer will increase yields and decrease growing costs. There's more net profit for you in amply feeding a small acreage than in keeping a larger field on starvation rations.

First quality fertilizers have proved that when properly used they return better than three dollars in crop value for each dollar invested in plant food.

Make sure that your investment in fertilizer will bring the greatest possible returns. Armour dealers are prepared to help you in the selection of the most suitable BIG CROP Fertilizer analysis for your particular soils. You can command their services freely. If you do not know the name of your Armour dealer, write to us.

I MENTIONED the fact some time ago that nothing would give me greater pleasure than to be able to join the Pennsylvania Farmer's Southern Tour, but that several things, any one of which was sufficient, prevented me from doing so. But I received a letter from one of my old friends and neighbors in Clearfield county which is so interesting to me that I pass it on. It shows us who did not take the trip what we missed.

".....My wife and I were hopeful that we might meet you and Mrs. Kester at Washington on the Pennsylvania Farmer tour. It was the most indescribable event in our lives. The crowd was like one big family, including Mr. White and Mr. Harris of the Pennsylvania Farmer force, and Mr. East of the Pennsylvania Railroad and Mr. McBride of the Seaboard Airline. Of course it is impossible to remember all the names, but some associations we made, I think, were lasting.

"The trip to Havana was delightful; it being our first voyage on a ship. This was one of the most fascinating experiences of the trip to both of us. Then there were the Penney Farms and the varied productions, Silver Springs, Plant City, Bradenton, Sarasota, the celery fields, the extensive tomato acreages, the wonderful groves of oranges and grapefruit.

"There are many beautiful homes in St. Petersburg, Palm Beach and Miami. We were interested in the Everglades, and the sugar cane fields and the sugar mills at Clewiston on Lake Okechobee where the great disaster occurred in 1928. The ocean was calm on the trip both ways, and the rocking of the boat brought to mind the lullaby time of my life more than sixty years ago.

"There are markers erected in commemoration of Columbus, and reminders of the awful tortures inflicted by the Spanish during their rule. There are evidences of much wealth, shown especially in public buildings, the Casino and the 160-acre cemetery.

"In Florida we were shown the greatest hospitality, and were met at all points with conveyances and a warm welcome. We were feasted far beyond our capacity. Every one of the ten days was just filled with sunshine, literally and poetically. If any one wishes to duplicate 'Butch' McDewitt's experience of being a 'millionaire for a day,' just let him get under the banner of Pennsylvania Farmer and its wonderful crew....."
William T. Thorpe.

A READER in Cumberland county, N. J., wants to know if newspapers could be used as mulch paper, and whether there would be any danger from the ink on them. Newspaper, if kept in place, would serve every purpose as long as it lasted. Some have tried it out in a small way with satisfaction. Owing to its size I do not believe it could be used extensively because it would be difficult to fasten it down on all edges so as to keep the wind from blowing it off. There is nothing to fear from the ink.

I HAVE received an interesting letter from a woman in Pike county who wishes to call my attention to the medicinal value of smart weed. She noticed that I had said its value as a preferred pasture for Japanese beetles was the only redeeming virtue of this pest. She wants me to know (and to pass it on) that there is nothing to compare with it as a remedy

for sore throat when made into a strong tea and drunk freely. And also that it is a sure cure for diphtheria if the leaves are steeped in vinegar. In addition, she states that the cells are filled with honey, hence it is excellent source of supply for bees.

Well, I am glad to know that this pestiferous weed has more than one redeeming quality. But I do not want any one to risk this or any other home-made concoction in the case of diphtheria. With all deference to the age and wisdom of the correspondent, I must question the statement that it is an infallible remedy for this curable of childhood. If there is any suspicion of diphtheria, send at once for the best doctor in the community. But you may test out the other recommendations to your heart's content. I believe, also, that a strong decoction made from it might serve as a substitute for some of the "hootch" of modern times, judged by the smell of the home-made stuff.

Friendly Talks

By Edgar L. Vincent

IN my lifetime I have heard of a few men who said they never had a word of trouble with anybody else. But I have thought that if we could have followed those men along at their lives it might be—mind, I do not say it would be—but it might be the first or last between men, and especially between neighbors, there has been a ripple of dissension, some little breach that had to be healed over some place where folks thought the toes had been stepped on, and there had to be a "conference" between the parties concerned before all would be as it was before.

And the question is, what do we do when such rifts come? How do we meet the difficulties? With bouquets or with icicles? With kindly words or with hot talk that will rankle in memory as long as life shall last?

Let the Hard Knocks Go

A good while ago a wise man advised people "so far as in them lies live peaceably with all men." This was good advice. How near can we come to living up to it? Hundreds of years before that another man said a day when the wildest of animals would lie down together, when men and trees would come up in the place of thorns and fir trees where now birches grow.

But if that time ever does come somebody will have to tear up briars and set out better trees. Bouquets and roses will have to take the place of thistles and ragweed. Folks will have to learn to be good and kind to each other, to bear one another's loads and to help each other up the hard hills of life.

Don't you think it is most time to begin living that kind of a life? If we could only overlook each other's faults; if we had the grace to let the hard knocks all go; if we could would get around where we could see the other fellow's side of all disputes and questions and let our actions be guided accordingly, then we might see our time the dawning of the golden day foreseen so many thousands of years ago, and have the satisfaction of knowing that we are doing just the little bit toward bringing in the new tide of that day!

Potato Fertilization

By J. B. R. DICKEY

(Concluded from last week.)

gradually been getting smaller until in 1929 only one made a divided application.

We have not enough tests to decide this question with any certainty. One test last year indicated that dividing a 1,200-pound application gave some increase over all in the row. If applications are to be over 1,000 pounds, especially where the soil has not been put in good condition as to fertility and organic content, or where the planter puts the fertilizer in too close contact with the seed, divided applications may be expected to give better yields and less risk of injuring germination. Where moderate amounts are applied on a fertile soil with a modern planter, however, row application is simpler and probably equally effective.

Concentrated Fertilizers Popular

In the past it was common among good growers to broadcast 600 to 1,000 pounds of superphosphate, sometimes before plowing, on potato land in addition to the complete fertilizer in the row. Though we have little data to prove or disprove the benefit of this practice it would seem of questionable value and in recent years has largely fallen into the discard.

During the last few years much more concentrated forms of fertilizer have been coming on the market. Nearly all of these are complete mixtures high in nitrogen. If any one can use these to advantage it will be the trucker and the potato grower who can use considerable amounts of ammonia to advantage and who finds the handling of the

large amounts of fertilizer which he needs more or less burdensome.

We have found by experimentation that the mineral forms of nitrogen and phosphoric acid are usually more efficient than the organic forms, as well as much cheaper. Many experiments have been conducted comparing the high analysis goods with standard mixtures on potatoes in Pennsylvania and in other states. There has been some variation as must be expected in all such tests, but on the whole there was little difference.

There are two general types of these high analysis fertilizers. First we have the straight synthetic complete fertilizers such as 15-30-15, and the 16-20-15, 12-21-12 and 10-30-10. The first three are rather high in ammonia, since the first figure represents nitrogen instead of ammonia, and should be divided by four and multiplied by five to reduce it to ammonia.

All are lower in potash than we usually think best. However, they have been used by practical potato growers with apparently very satisfactory results. They are very readily soluble, in fact they must be kept in paper-lined bags to prevent their drawing atmospheric moisture. They are usually in the form of gray pellets like small shot, have no odor, are not caustic and have excellent drilling qualities.

Many double-strength mixtures have also been made up such as an 8-16-14, just double a 4-8-7. These usually are based on the high analysis materials mentioned above or other synthetic nitrogen products to which have been added standard forms of phosphoric acid and potash. These double-strength mixtures should give just as good results as double the quantity of standard goods of similar rates.

Naturally, being very concentrated and very quickly soluble, the high analysis goods must be used with care to prevent burning, but if a proportionate amount is applied with a good planter no more trouble need be anticipated than with standard materials. These synthetic products are lacking, or very deficient, in such elements as sulphur, lime, magnesia and other salts, which, while not considered as direct fertilizers, are present in varying amounts in most fertilizers mixed from superphosphate and potash salts, and are essential to plant growth or may have a stimulating effect upon it.

On some soils the continued and exclusive use of the synthetic materials may create a shortage which might be detrimental. Only experiments in future can determine how serious is this danger and what must be added to rectify it.

"MARKETING Pure-Bred Livestock" is the title of a new book by M. N. Beeler which contains good ideas for cattle, sheep, swine and horse breeders who have surplus breeding stock to sell. The author has drawn on his wide acquaintance among successful livestock men for illustrations showing the profitable and unprofitable sales methods.

The following partial list of chapter headings indicates the scope of the book: "Methods of Selling, Selling Ideas That Have Paid, New Ideas in Auctions, Publicity Methods, Advertising Mediums, Advertising Copy, The Cost of Selling Pure-Breds, Business Methods, Pure-Bred Marketing in Foreign Countries, Tendencies in Marketing Pure-Breds."

"Marketing Pure-Bred Livestock" is published by the Macmillan Company, New York City.

Primitive farming methods still prevail in some sections of Cuba.

A LED BULL

LAST Sunday J. B. Keller of Mount Joy, Pa., was seriously injured by his bull, which he was leading by a rope when it suddenly attacked him. Fortunately several friends saw the affair and went to his aid in time to save his life.

SPECIAL EGG MARKETS

EVERY spring we get calls for help in locating or developing special markets or outlets for fresh eggs. We have found that it is impossible to interest buyers at this season. They say that too many producers who think they can supply choice eggs all the year are mistaken. The time to find a special outlet for eggs is in fall or winter, for the buyer then has confidence in the ability of the seller to supply them regularly.

FROM LIFE

AN English paper recently reported the sale of a herd of cattle every member of which traced to one cow, with which cow the late owner started his herd in 1882. We have known two such herds in this country, one of pure-bred beef cattle, the other of pure-bred dairy cattle. In both cases the breeders began with a single pure-bred cow and built up very good herds without ever buying another female. Men who have access to good sires can thus secure a pure-bred herd or flock at very little cost. Blood is about the cheapest thing in the world when its cost and its value are correctly rated.

TWO CASES

THE management of a New England cotton mill recently submitted this proposition to its employees: A certain big order could be obtained which would guarantee to 1,000 workers steady employment for six months. But the price at which the order must be taken made some reduction in wages necessary to avoid loss to the mill. The employees were asked to vote on accepting a slight reduction in wages to enable the mill to secure the order. They voted four to one against it. We don't pretend to know whether they voted right or wrong on this proposal, but wisdom is not always the prevailing element in such cases.

Before jumping to the conclusion that labor will not accept reductions except by compulsion we might look at another case: The men employed by a certain mining company were notified that the mine would shut down

on a given date because its product could not be sold except at a loss. They went to the management and proposed to work for lower wages until the market would justify something better. Their proposition was accepted and that mine continued to operate while many others were idle. There can be no question about the wisdom of this action, for time has proved it.

TWO VETERANS

AT the forty-eighth annual meeting of the Tri-State Sheep and Wool Growers' Association last week two veteran members were honored, both having been active in the organization's work for forty-five years. They are Mr. S. C. Gist of Wellsburg, W. Va., who was given a life membership; and Mr. R. L. Munce of Washington, Pa., who was given a fine cane. The representatives of the sheep industry who attended the meeting expressed no despair over current prices of sheep and wool. The veterans have all seen such periods of reaction or depression and they know that their industry will survive them. They advise sticking to the business, improving the flock and studying better methods of production as essentials to future prosperity.

TO RAISE CHICKS

IT is safe to predict that within the next few weeks hundreds of poultrymen will come to grief with their new flocks of hatchery chicks. Some of them will realize that their chicks die because the care-takers fail to observe a few important rules of sanitation and feeding. Others will blame the hatchery. Little themselves, baby chicks illustrate the vast importance of little things. The "grow healthy chicks" campaign fostered by agricultural extension departments in many states gives almost incredible results to those who observe scrupulously the simple rules laid down. The county agent has the rules; any one can follow them if he wants to.

UNDERCONSUMPTION

BY actual count one day last week 1,740 persons appeared in a "bread line" to get free food here in Pittsburgh. Unemployment is said to be greater in some other centers of industry than it is here. Whether this is correct or otherwise it is certain that many are without work and consequently not buying food or anything else in the usual volume. How many of those not now at work have assumed obligations by buying on the installment plan? And how many of those at work have so many obligations of this kind that they cannot be liberal buyers of foodstuffs? There is no way to answer such questions, but probably these two influences, unemployment and installment obligations, have much to do with unsatisfactory markets for farm products.

EXPORTING EGGS

THE Pacific Egg Producers' Cooperative is building up an export trade in fancy eggs. South and Central American buyers, long prejudiced against the unreliable local product, are learning that they need not question the antecedents of certain brands of eggs from the United States. The Pacific Egg Producers point with pride to a single shipment of 50,000 cases to Argentina. Each exported egg is stamped with a quality guaranty in the form of the appropriate initials "PEP" or with another of the organization's registered trade-marks. Eastern producers need not hope that South America will remove Pacific Coast eggs from the New York market. Nevertheless, after hearing so much about Chinese competition, the substitution of packers' by-products for egg albumen in industry, etc., it is refreshing to recall this more optimistic note.

"WESTWARD HO!"

ENCOURAGED by the hearty response to our announcement of a vacation trip to Florida and Cuba this winter, and the evident satisfaction of all those who took this trip, we are contemplating a western excursion this summer. It will cross the great industrial and agricultural regions of the Central West, traverse the vacation land of the Rocky Mountains and continue on to the Pacific Coast. The return will be made by another route, chosen so that both going and coming new things and points of interest will be covered. In discussing this trip with railroad we find that we can obtain very reasonable rates, which will be materially lower than an individual could obtain for the same service and attractions.

While there is much work to do on the farm before vacation time we are announcing the proposed trip now in order to give readers opportunity to make their plans if they would like to go. If any persons in your neighborhood made the Florida-Cuba trip we suggest that you talk it over with them and get the opinions of the Pennsylvania Farmer vacation trips. The western trip will be conducted with the same attention to the travelers' comfort and convenience as characterized the southern tour. And if you would like to go along with us to the Far West next August we should appreciate it if you would write and let us know.

A PLEA FOR EQUALITY

DURING the past ten years we have heard and read many pleas for the equality of agriculture with industry. Here is a plea of the same nature but in reverse. It is made by Harrison F. Jones, Executive Secretary of the National Poultry, Butter and Egg Association, who says: "When all is said and done agriculture has been the recipient of too many favors and industry and commerce have been the victims of too many restraints. If equality is to be established between agriculture and other industries it can only be done through equal laws." No doubt we shall hear more of the same nature in the future. A great protest against some legislation supposed to be in the interest of agriculture is now developing. Thus far it consists merely of words, but some day we may have to work to keep such reactions from interfering with necessary and proper laws in relation to agriculture.

THE NATIONAL PLAN

LAST week, at the meeting of the Tri-State Sheep and Wool Growers' Association, Mr. J. F. Walker gave a very fair presentation of the national wool marketing plan as worked out by the cooperating organizations and the Federal Farm Board. He did not attempt to "sell" the plan to any organization but stated the claims made for it and answered questions about its possible advantages and disadvantages. From this discussion it appeared that the chief financial advantage, from the standpoint of the Ohio and other eastern organizations, is the ability to borrow money at a low rate of interest to finance the organizations and the growers. The principal disadvantage to the Ohio organization is an addition of three-quarters of a cent a pound to the cost of selling. That organization's charges will thus be raised to 30 per pound. So far as the smaller eastern organizations are concerned probably the plan which are well established will continue to handle their wools as in recent years. The same is true of much of eastern fine-wool territory, where selling to mills is the custom and has been for a long time. The national organization is expected to handle about 1,000,000 pounds of wool this year.

New Jersey Farm Comment

By G. W. HARRIS

well as the entire rural interests of the state. This study will make it possible to bring these different interests together and aid each other in definite rural township problems.

MEMBERS of the Hunterdon County Poultry Association are interested in the possibilities of establishing an auction market in Flemington for the sale of eggs and poultry products. At a recent meeting of the poultrymen Alben E. Jones of the Bureau of Markets pointed out some of the conditions in the state which might make such a market advisable.

South Jersey producers for the past few years have been selling their eggs on a premium basis, but in Mr. Jones' opinion this has become only a premium in name and some other method of estab-

packing plants and buyers in the eastern markets know that they are always uniform. Members of this organization have taken a step further in standardizing their products than most co-operators by standardizing the feeding of their flocks.

Producers of nearby eggs might well take a tip from these West Coast poultrymen on grading and standardizing their product. Just recently these West Coast eggs have been topping the nearby egg market by two to four cents.

At ten-thirty we boarded the P. R. R. tug boat "Lancaster" for a five-hour trip around New York harbor and a view of the shipping facilities of that city.

The next morning we arose before dawn to see the western and southern produce sold at the terminal markets. At five-thirty the gates at the Pennsylvania Produce Terminal were opened to let the noisy horde of buyers in where there were over 200 carloads of produce for sale. Before eight-thirty this great terminal was empty of fruits and vegetables and a stroll through the Washington Street market showed us where this produce had been taken and how it was being disposed of.

During the past year 87,000 carloads of fruits and vegetables were unloaded at the Pennsylvania Produce Terminal, and this was only a portion of the perishables necessary to feed the city of New York. The method of buying and selling produce in this building with its ten acres of floor space again emphasized upon our minds the necessity of careful grading and standardizing of farm products if they are to bring the most profitable returns.

IT is encouraging to dairymen to note that the market report showed considerable improvement in the storage holdings of butter in ten markets and that this was attributed to more liberal use of this butter. The net reduction in the surplus for the ten markets during the first 20 days of March was 3,620,554 pounds.

One day last week as I passed a chain grocery store I noticed a sign in the window calling attention to the broadcasting hour of the Lamb Feeders' Association. Here is one interesting example of a farmers' organization attempting to stimulate and increase the consumption of their product by radio advertising. Not only that, but the much criticized chain store was cooperating with them in carrying out their project. Possibly the dairymen might profitably follow the lamb feeders' example and let the housewife know that butter is cheap.

MANY poultrymen are sold to the idea that substantial improvement in poultry flock egg production is based on the use of individual breeders of known production capacity and record, says Willard C. Thompson, poultry husbandman of the N. J. Experiment Station. Yet there are many who do not find themselves in a position to carry on the extra work involved in trapnesting and pedigree hatching, which such a basis of selection requires.

These poultrymen can, however, during this spring chick rearing season, do a great deal which will tend toward obtaining similar results. In every hatch of chicks there will be some pullets which will reach egg-laying maturity ahead of others. It is a known fact, other things being equal, that the early maturing pullet is the best egg producer. Therefore, the poultryman should know the age of each pullet when he is selecting birds for the new laying flock in the fall. Probably the simplest method for making this information available at all times is to toe-punch the chicks of each hatch this spring, and then keep a record of the dates of hatches and their distinctive mark.

This simple method of marking is possible regardless of whether the chicks are hatched at home or are purchased. Usually, the average poultryman finds it both economical and convenient to buy his chicks in two or more batches during the season. Unless the chicks of each hatch are definitely marked the chances of uncertainty as to age when they will lay are increased and a loss of

Four Paying Passengers

lishing a New Jersey top quotation should be undertaken. During recent weeks Pacific Coast eggs have been over-selling New Jersey nearby eggs by at least four cents. Even with the two-cent premium which one of the South Jersey cooperatives secures, this still nets the New Jersey producer two cents less than the Pacific standard grade.

Practically all the Hunterdon county poultrymen now sell their eggs individually. The plan under discussion at the present time is to organize a non-profit cooperative handling at least 500 cases of uniformly graded and candled eggs each week and selling these at auction.

Such a market would undoubtedly attract many New York buyers, but according to the opinion of one Philadelphia buyer it probably could not be used profitably by the Philadelphia trade. Egg prices in the Philadelphia market are set by the exchange rather than by sales to the retail trade. It is claimed that the exchange is controlled by a few large buyers and that buying eggs at auction might often result in selling at a loss.

Another meeting of the poultrymen interested in the project will be held on April 16 when it is hoped that a definite decision will be made.

LAST week I had the pleasure of spending two days with a group of Ohio farmers on a visit to the New York City markets. The trip was sponsored by the Ohio Farm Bureau Federation in cooperation with the Pennsylvania Railroad in order that these producers might better understand handling and buying methods in the city markets.

Our first visit after our arrival in New York on Tuesday morning was to the Pacific Egg Producers' Association offices and sales rooms. This organization is owned by West Coast egg producers and is controlled largely by four cooperatives with a total membership of over 10,000 producers. During the past year, these shipped over 1,000,000

DAIRYMEN will have a real opportunity to secure good sires for their herds from Burlington county breeders on Saturday afternoon, April 5, when sixteen or more of their pure-bred bulls will be sold at auction at Locust Lane Farm near Medford. Milk producers should take advantage of this present over supply of high quality bulls in the county and replace their "scrubs" and ordinary herd sires. All animals offered will be sold, regardless of price. County Agent Thompson has already secured for the sale twelve pure-bred Guernsey bulls, the dams of which have an average production of 513 pounds of butterfat. Four Holsteins will be sold. Their dams have a total average production record of 487 pounds of butterfat. When we consider that over half of these records were made at two years of age, it is evident that these animals will make satisfactory future herd sires for most any dairyman's herd. The animals offered for sale range from two months of age to two years of age.

COUNTY AGENT SMITH in Burlington county warns his growers against increased planting of cabbage this year. He points out that the favorable returns obtained in the intermediate shipping states, which include New Jersey, in spite of the increased acreage in 1929, may cause a further increase in planting in 1930. Low yields probably caused the 1929 market situation to be more favorable than that of 1928 and a decrease of five per cent in the acreage in those states would probably still furnish adequate supplies in view of the usual summer price slump. If more growers would take such warning to heart instead of becoming over optimistic after an unusually profitable season, there would be less demand for "farm relief."

THROUGH the New Jersey Joint Committee on Rural Electrification, which was organized about a year and a half ago, utility companies and agricultural representatives have been brought together in directing the work of electrification of farms in the state. During this time the work has been directed by this committee and the cost of operation has been borne by the utility companies.

Recently the committee ceased to be a directing and financing organization for the promotion of rural electrification, and now is merely a clearing house of available information concerning this work. Arrangements were made whereby Mr. Krueger, the engineer in charge of the rural electrification of the Joint Committee, would be employed by the extension department of the Agricultural College and his work financed by that agency instead of the utility companies. Utility companies have acknowledged the importance of the work of the joint committee through their employment of representatives in their own behalf who are covering their territories with an idea of the extensions and promotion of the use of electricity on farms and in farm homes.

The use of electric power on farms is still in its infancy and it would seem that rural problems could be solved more efficiently through the joint committee as originally organized than through independent interests. Through this committee all interested parties were brought together to work toward a common goal, the development of rural electrification.

THE State Department of Agriculture presents some figures concerning the agriculture of the state which may give farmers a better realization of the importance of their industry. For feeds, fertilizers, seeds and milk cows it is estimated that New Jersey farmers will spend more than \$32,000,000 this year. This amounts to more than \$1,000 expenditure on every farm. The hired farm labor bill which so often eats away the farm profits totals \$19,000,000.

In return for these expenditures it is expected that the sale of dairy products will exceed \$17,000,000; baby chicks \$4,500,000; and from fruits and vegetables more than \$30,000,000.

PLANS for a study of the activities of township committees in New Jersey to show just what they are doing along various lines and the possibilities for rural improvement are under way. This survey is being made by the State Department at the request of the New Jersey Federated County Boards of Agriculture and should bring to light much information of use to various townships as

The Farm Home

How We Hold 'Em

By GERTRUDE S. STEWART

HAVE you heard this one? "Delicately perfumed cake powder may catch a man, but it's baking powder that keeps him." Now honestly, have you ever known one of the male species who didn't smile all over his face when he spied the big Sunday cake all snowy with coconut, or even smell a rich chocolate cake while still in the oven?

Here are several of the finest cake recipes ever printed. My family enjoys them over and over. In fact, "friend husband" often says (after eating some of the testing I must do) "It's a shame to feed us cake like that when you can make such delicious ones."

I'll let you have my three very best cakes, and maybe you will let me have some of yours that are different and interesting.

Chocolate Cake

One-half cup butter, two eggs, one-half teaspoon salt, one-half cup boiling water, one-half cup cocoa, one teaspoon baking powder, two cups light brown sugar, two and one-fourth cups sifted cake flour, one-half cup sour milk, one teaspoon soda, one teaspoon vanilla.

Cream the shortening, add one cup sugar gradually, mixing well. Beat the eggs very light, then beat into them the other cup of sugar. Combine the two mixtures, beating thoroughly. Add baking powder to the sifted flour, also the cocoa and sift the mixture three times. Now alternate the flour mixture and sour milk, beating each well into the batter. Add the soda to the boiling water, and beat it into the cake mixture. Add vanilla. This will make two fine layers of dark chocolate cake. I always double the recipe and bake two pans of cup cakes, too, to be eaten hot. Readers have been asking for a chocolate cake that is not red, and as Amos says, "Here it is."

Easter's Golden Cake

Seven-eighths cup sifted cake flour, one-fourth teaspoon salt, one-third cup water, one teaspoon vanilla (or half lemon or half almond), one-half teaspoon cream of tartar, one and one-fourth cups sifted sugar, five eggs.

Boil the sugar and water until it spins a long thread, 238 degrees F. Sift the flour, cream of tartar and salt together four times. Beat the five egg whites to a stiff froth, the yolks separately beaten to a thick, lemon-colored froth. Pour the syrup in a tiny fine stream over the egg whites, beating constantly. Continue beating as the mixture cools, then fold in the yolks and flavoring. Lastly, fold in the flour just a little at a time. Bake at least forty minutes in a slow oven (350 degrees F.), then decrease the heat (325 degrees F.) and bake a half hour longer. Use a tube pan, and invert the pan when removed from oven. Let it cool one hour before removing from pan.

Spice Cake

Three-fourths cup shortening, three eggs, one teaspoon soda, one cup raisins, one-half teaspoon salt, four teaspoons baking powder, two and one-half cups flour, one and one-half cups sugar, three-fourths cup sour milk, one-half cup raisin juice.

Let Us Have Them

If you do bake cakes, and have some that are as good or better than my series, let us have them to share with our readers. Be very careful about measurements and directions. Let's make it a contest. For the best ones we receive a Checker Board Cake Pan will be sent as a prize. The prize recipes will be printed each week during April. Contest closes April 5 and starts TODAY. Address all recipes to Cake Baking Editor, Home Department, Pennsylvania Farmer, 1201 Penn Ave., Pittsburgh, Pa.

one teaspoon nutmeg, one teaspoon cloves, one teaspoon cinnamon.

Soak the raisins in one-half cup boiling water until cold. The water is your raisin juice. Blend the sugar and fat. Add the eggs and beat hard. Then add alternately the flour (into which you have measured salt, baking powder, soda and spices) and the sour milk and raisin water. Lastly add the raisins. Bake in three layers in a moderate oven. Or two layers and a supper of cup cakes, besides.

We all know some women who simply cannot bake cakes, and they deserve our profoundest sympathy. And a few of our neighbors do not have the time. Often the woman with but one or two to cook for, feels it a waste to bake a nice big cake and throw half of it out when her husband is tired of seeing the same thing on the table.

Those women might like to know where they can buy really good cakes in small quantities, or perhaps cup cakes for the "sweet tooth" we all

INTRODUCING A FAMILY OF LEADERS

This splendid group is the family of our Master Farmer Guy A. Leader. Mary, the eldest, is at West Chester Teachers' College; Paul, just seventeen, when he finishes high school will take up poultry work; George, the twelve year-old snuggling youth, wants to be a teacher; Guy, Jr., although only ten, plans to be a farmer; Henry at eight desires a college education. The little girls, Jean and Lois, keep every one busy and smiling. What a grand old-time family—just like Roosevelt admired!

hear so much about. We'll be glad to give the address of just such a place, and they'll mail your orders promptly. Send the usual self addressed stamped envelope with your request. If other problems are bothering you this spring, ask them at the same time.

About Asters

FOR the past few years I have heard some of those who have raised asters for pleasure and profit say they have had poor luck on account of the aster beetle or blight.

Two years ago I had wonderful asters. They grew rapidly and stalks were sturdy until blooming commenced. One morning I went out to the garden to find the one stalk nearest bloom to be covered with aster beetles and have a withered appearance.

I at once mixed a solution of prepared spray according to the directions on the jar, filled my sprayer and thoroughly sprayed every plant. This I repeated every few days after dew had dried off until I was satisfied I had won out.

The result was I had an abundance of bloom and large stalks. Last year I repeated the same process only beginning to spray with the pyrex solution earlier.

Nora Kelly.

To help prevent colds, give the children and yourself a cold splash every morning after washing the face and hands. Apply cold water to the throat and chest. Do not start this practice when the person has a cold, but begin it when in good health.

Gains by Subtraction

By HEPSY NEFF

THESE are busy days on the farm with every hour full from sunrise to sunset. Indeed, it is possible to have too many full hours a day. Even a machine lasts longer if the wheels are stopped and allowed to rest occasionally. Manufacturing plants have found it worth while to stop all operations and have one quiet day week.

The clearest proof of such gains has come from the experience of armies on the march, eager to make their goal. It is a matter of history that an army keeping its men steadily on the march, without any day of rest, loses in both men and morale as against an army which keeps one day in seven for rest, a fact which any doubter may verify for himself.

Why not accept this need of a period as a fact, as dependable as the fact that water will not run up hill and plants will not grow without proper soil, moisture and sunlight. Many of us do accept just such facts as true and dependable and at the same time go on acting as if they were not true. For instance, we do see our animals taking their rest, especially after eating until satisfied. It has been proven that such a period after the midday meal, even rest of half an hour, makes the afternoon easier as well as more profitable.

Machine shops report an increase in accidents as weariness increases. Would it not be the part of wisdom to have our daily program settled far as possible so that our daily activities may fit together, become habits and not collide, head on, like motor cars in the hands of careless drivers?

There is another and perhaps greatest gain from acquiring the subtracting habit. Naturally we subtract the things that are of least value to us and our families and that brings us to a study of the things that do most for health. The loss of health even temporary illness, is so expensive, so disabling, that we are forced more and more to seek causes of our losses and find remedies.

Once typhoid fever was a visitor in many communities. The water supply was properly guarded, typhoid became a thing of the past. We learned that the water supply was the usual cause of typhoid and we subtracted every well that was not wholly safe from any surface drainage. Both the best and the best motor cars are teaching us that the use of best fuel oils and the best lubricating oils give best returns for our money. The human machine at its best possesses great resistance to disease, even more, it checks invading disease germs, has at times, been able to wholly defy disease, the secret of all this is to subtract from our habits, and our surroundings, everything that hinders health. Nature will do the rest.

Save the Oils or Fats

DID you know that chicken fat is excellent cake baking? I did, but had never tried it until this past winter. A neighbor had a large goose for Christmas and she sent me all the since they buy all their baked goods.

Well I had a quart bowl full to the brim of white fat with no perceptible odor and practically tasteless. I used it in many ways—biscuits, pastry, cakes and cookies, and all were most delicious. When the bowl was empty, I vainly went for more.

Clarice Raymond

Mothers, remember that your health and that of your children are closely interwoven. A mother cannot neglect her own health and expect to keep the children's health at top notch. If she plans and cook good meals, keep order and cleanliness and serenity in her home, she must put every effort to keep herself perfectly well.

SAVE THIS 50

THERE are many washers that cost more money than the Speed Queen. There are none of finer quality—none that offer any desirable advantages of washing efficiency, beauty of finish, or durability not found in the Speed Queen. Why then, pay more? Why not take advantage of this \$50 saving? The Speed Queen gives you everything you need for high quality laundry equipment.

These Quality Features:
Large Balloon Wringer Rolls
Polished Aluminum Tub
(or Choice of Porcelain Tub)
Submerged Aluminum Agitator
Standard Capacity
Double Walls
Enclosed Mechanism
Removable Splash Ring
No Oiling Necessary
Type Briggs-Stratton Gasoline Engine

SPEED QUEEN

Aluminum Washer

For homes having electricity, the SPEED QUEEN is available with a high grade electric motor.

Below & Seelig Mfg. Co., Wisconsin. Please send me printed literature describing the advantages of the SPEED QUEEN for farm laundry service and tell me also the name of the nearest SPEED QUEEN dealer.

Below & Seelig Mfg. Co., Wisconsin.

Brightening the Home

IN refinishing old furniture do not forget that wax-polishing is not only the easiest, but also one of the oldest and best methods of finishing. It is customary to wax wood that has not been filled, but to which a coat or two of thin shellac has been applied to set the stain. Filled woods do not show the polish so advantageously. The wax finish will not show scratches to such an extent as varnish or French finish, and may be renewed in the simplest manner.

To remove white marks caused by hot dishes on your dining room table, rub vigorously with warm camphorated oil. Spirits of camphor may be used instead, but requires careful handling. If you use the spirits, heat, moisten rag and rub spots very lightly. When the color has been restored, rub on a light coat of wax, let dry and polish. If you have waxed your table frequently, however, you will have no white marks. The wax builds up a protective covering which heat will not penetrate.

Preserve Original Color

If your wood floors are stained dark, you can help to preserve the original stain by coloring the wax with which you polish them. Put some wax in a can, add a little oil aniline dye, and heat only enough to mix well. Cool to its original consistency before using. You may purchase the stain at any paint store.

If you wish to preserve your inlaid linoleum on the kitchen floor, do not scrub it. When it is first laid, wax it two or three times with light coats of wax, well polished. Use a dust mop daily. If anything is spilled, wipe it up at once. When washing is necessary, use only a mild soap and lukewarm water. Then re-wax. The wax will fill the pores of the linoleum and the dirt will not grind in. If your linoleum is printed, give it a light coat of varnish before waxing to preserve the pattern.

Surprise! Surprise!

"WHAT shall we have for dessert tonight?" I asked Bernata as we hurried with the breakfast dishes. "Oh, make it a surprise," was her quick answer. And I did. It was a delicious cream pudding, but I topped it with slices of golden orange and a generous sprinkle of cocoanut. That part of it made it a surprise, and the children responded with twinkling eyes.

When a member of our family has lost something and it is found by another, it is slipped under the owner's plate at the next meal. Unless that something be clothing, when it is put at its proper place, and the owner is delightfully surprised to find it right where it ought to be.

Surprises are jolly in the lunch boxes and I always hear of it in the evening. Yesterday morning when I went into my dining room, a bouquet of pussy willows greeted me. You see farm husbands "say it with flowers," too.

Junior longed for a ball glove. Instead of stringing him along with one promise after another, little was said, but the lad was happily surprised to find it at his place one springy morning. He was told then that boys who work diligently have more play time than loafers.

Bernata thought her life empty without a fountain pen. So the day it was placed by her plate she was warned that improvement was expected in her writing. It's not the great big solemn things we do that keep homes running smoothly. Just try surprises with the little everyday commonplaces and see.

Mrs. J. P. Nawroot.

When the shirt collars wear thin and ragged, rip them off and turn them upside down, sew on as at first and they look much better and last as long as the other part of the shirt.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR
That's why

FELS-NAPTHA LOOSENS DIRT... 'WITHOUT HARD RUBBING

The reason Fels-Naptha gets rid of dirt without hard rubbing is easily explained.

Fels-Naptha isn't "just soap." It's good golden soap and plenty of naptha. Just smell the bar. Your nose tells you there's plenty of naptha in it. And naptha, you know, is the safe, gentle dirt-dissolver that dry cleaners use.

With these two safe, active cleaners working together, you're bound to get extra help. Extra help that quickly loosens the most stubborn dirt and gets your clothes clean clear through.

Convince yourself. Use Fels-Naptha in machine or tub. Use it for soaking or boiling; in hot, lukewarm or even cool

water. See what a wonderfully sweet-smelling wash it brings you. Use it for household cleaning, too. Because it works quickly and gets your hands out of water sooner, Fels-Naptha helps keep your hands nice. Get a few bars at your grocer's today.

FREE—a Fels-Naptha Chipper. Many women who chip Fels-Naptha into washing machine, tub or basin find it handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha) just as you need them. Sent free and postpaid on request. Write today. THE YOUNG PEOPLE

A Beekeeper's Experience

IT may be that other boys, or girls, will become interested in beekeeping, so I am writing to tell them of my experience with them. Of course this is in a small way, but I am encouraged by the report which our County Agent has recently sent me. I hardly know how to "blow my own horn," but it seems that the Polytechnic Institute at Blacksburg, in charge of the Four-H Club work, decided that I had made the best record in bee club work in the state, and were kind enough to say that I had used improved methods, had given winter feeding, protection, etc.

I first decided to take up beekeeping in 1927, when I captured a stray swarm of Italian bees. Although the hive I put them in was well supplied with honey, they died the following winter—probably because the queen was too old to stand the cold weather. The old queen goes with a prime swarm when it leaves the parent hive.

The following summer I bought three frames of brood with Italian bees and a young queen. These built up to a strong hive, but I had to feed sugar syrup that winter, as I had no combs of honey to give them. This colony came through in good shape.

In the spring a neighbor bee-keeper told me of a man who had some fine Italian bees for sale. I got in touch with him and bought four colonies. He gave me some splendid books on beekeeping which I found very interesting and helpful. Another neighbor had a colony of black bees which she did not want to bother with, so she exchanged with me for a sitting hen, eggs and vegetable plants. I also bought a colony of black bees that we had on the farm for some time; then I cut a bee tree on our farm.

Ask Ma why Father is bald.
By Blaudena Belt, West Virginia.

which made a nice strong colony. I transferred all bees to modern hives.

Last spring I clipped the wings of all my queens to prevent their going off with swarms. I reared my own Italian queens and re-queened seven colonies last summer—which leaves only one of the eight colonies with a black queen. I will get rid of her this season.

My total surplus honey crop for last summer was about 256 pounds. I found a ready market for all that we did not use at home. I have exhibited my honey at the County Fair for two years. The first year I won first in the Four-H Club class and second in the general exhibit. Last year I won first in both classes.

My total receipts, including value of bees and equipment at the end of the club year (over what they cost) include value of queens reared, honey sold and used at home, prizes won at fair, all amounted to \$142.46. Total expenses for the year were \$46.54, which leaves \$95.92 labor return, or profit. The county agent, F. H. Derr, and Mr. Brown, in charge of the bee work in Fairfax county, checked my book before sending to Blacksburg.

Of the different books that I have read on beekeeping, I think that "Starting Right with Bees," is the best for beginners. I am a subscriber to "Gleanings in Bee Culture." It is

a monthly journal and is very helpful.

If one goes at it right, there is little danger from bees, and they sure furnish lots of honey, and are the most interesting study in the world.

Marshall A. Doak.

Marshall Doak of Virginia, author of the interesting letter on bees, was delighted when he trapped this big red fox which had made raids on his Brown Leghorn flock. Marshall has promised to give us another story about bees.

Win a Prize

MAE DEEM of West Virginia is responsible for the following questions. She says the first eleven are to be answered with a breed of chickens. The rest are indicated in parenthesis with what type of word you are to use in the answer.

Three gold pencils will be given to those who send in correct answers, accompanied by the best original poem, story or contribution for our Easter page.

Send your letter immediately to Young People's Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

Questions

1. Where did the Pilgrims land in America?
 2. What sort of amusements do boys between ages of eight and twelve enjoy best?
 3. What is known as the little fighter that never gives up?
 4. What race of men enjoyed especially to take scalps?
 5. What language is spoken in Mexico?
 6. What is the name of a tribe of Indians?
 7. A city in Germany.
 8. What do little boys like to wear on their heads?
 9. A fine straw used for hats.
 10. What is the name of an island in the East Indies?
 11. What does your big sister use to make her white shoes look nice?
- (Answers to the first eleven questions are breeds of chickens. Look through the advertisements in this paper for help.)
12. What does a rooster do to wake people? (A bird.)
 13. What was an officer in ancient European history called? (A bird.)
 14. From what did Henry make his Ford? (Abbreviation of a state.)
 15. What is the name of a favorite grape? (Cap. of State.)
 16. How did Mary feel when her bean failed to come? (Abbreviation of state.)
 17. To whom was the Perfect Tribute written? (Dread of sheep.)
 18. What is a person called who can live without much sleep? (A bird.)
 19. A boy's name? (Dread of hops.)

My father's Green Daid.
He keeps his hat on in the house.
By Verna Mae Gruber, Pennsylvania

Great aunt, great grandmother, third cousin, sister-in-law, nephew, stepmother, yourself and grandfather.
Prize winner: Estelle V. Duck, Penn'a.

Coloring the Cats

Florence Majors, Betty Besworth, Fielder Schillingberg, Frederick L. Winters, Mary L. Myers, Jane Zettle, Ada Erb, Dorothy Grace and Esther Whigam.

Queer Pets

Stories about these queer pets will appear in an early issue. Prize winners include—Vernon Mardis, Kathryn Black, Henry Stubb, Edith Mellinger, Everett Craddock, Gertrude Hopkins, Ruth Gardner, Eleanor Snyder, Oriana Lorraine Elton, Robert Reihman, Dorothy Gounder, Frank Hart and Betty Bean.

Girls' Names Contest

Lily, May, Bertina, Baby, Carrie, Adeline, Dora, Patience, Ann, Eve, Jenny, Belle, Effie (F. E.), Bridget, Grace.

SPRING-TIME

By Isabelle Minear, West Virginia
TALKING the buzz of the bee in the old apple tree,
And the call of Bob White in the thicket,
There's the rare perfume of flowers in bloom,
And the chirruping cry of the cricket.
The mountains old, touched by sunshine gold
And the green of the sea nymph's gown,
Rise to the sky, lifting proud peaks high
To receive a golden crown.

From the steep rock walls comes the hum
Of the falls.
To be fairy music known,
The water gleams and the soft air teases
With a fragrance all its own.

There's a spring-time song the whole day long
On the lips of bees at play.
There's a school-boy shout when school's
let out,
For springtime's come to stay.

Easter Lilies from Crepe Paper

FLOWERS of all kinds may now be made from crepe paper for home decorations. And it is the most fascinating work one can imagine. From tiny violets to great fluffy chrysanthemums, crepe paper may be made to look like real flower petals. But at this time of the year there is no flower more appropriate than beautiful lilies. All you need to make them is a few folds of crepe paper and some wire.

Send ten cents in stamps or coin for the booklet giving full instructions for making Easter lilies and many other flowers. They are simple to make when you have the pattern and complete description contained in the booklet.

Address Party Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

Use BAG BALM if you want Bag Balm results

Delicate tissues

need delicate healing

Avoid imitations which may have similar names, or a similar package, but which can not produce BAG BALM results. Some ointments, containing Formalin, are actually harmful when used on delicate tissues.

NOT all healing agents are suitable to the safe healing of udder and teat injuries and disorders. The delicate tissues may be definitely harmed and normal condition retarded if the application is unsuited.

There's no need to take chances. BAG BALM, the great healing ointment, has won a nation-wide reputation by its efficiency and economy for treating all udder and teat troubles. Quick, thorough results are achieved by reason of a scientific combination of refined medicated ointment, plus a remarkable penetrating antiseptic oil. This oil carries the medication quickly to the seat of the trouble; promotes circulation and rapid healing.

Cuts, chaps, cracked teats, bruises and similar superficial injuries often are cleared up between milkings. For treating Caked Bags, Bunches, Inflammation of the Udder and other ills of the milk-producing organs.

BAG BALM brings prompt benefits

BAG BALM is inexpensive—large 10-ounce package only 60¢. It cannot irritate the milk. Sold by feed, drug, hardware and general stores. If dealer is not supplied we will mail postpaid. Ask us for FREE 32-page Cow Book.

Farm & Dairy

By L. W. LIGHTY

"I HAVE eight acres to sow to permanent pasture. With it are a few acres along the creek which will yield some grass. I contend this eight acres is enough for six cows and two to four head of young stuff that I will have most of the time. My neighbor, an older man, says it will not be nearly enough. Tell me about this and tell me how to seed this down and what to sow." This from a Northumberland valley farmer. What I say is liable to fit any valley or hill in this or neighboring states.

An acre per cow of good land with pasture in good condition is fully sufficient as to area. We should all understand that no area is large enough to furnish all the feed the cow needs all summer to give a good flow of milk. She must have grain. When the grass is young and lush it is all right to let the cow have a little rest on grain digestion, but soon the grass gets harder and is not so plentiful. Then we feed grain and continue to do so the rest of the season. With an abundance of pasture the cows need less grain than with an abundance of dry feed, but they need grain. With a stream of water and shade the inquirer will have an ideal pasture.

Soil Requisites

Aside from redtop all good pasture grasses are benefited by lime. It is profitable to apply lime in excess of the needs for neutralizing the acidity because bluegrass and clovers need a good supply of lime to do their best. A heavy application of potash and phosphoric acid is right, but the application of nitrogen should be moderate, as it is readily lost if not used by the plants.

The seedbed should be compact and well pulverized before we sow the grass seed. I find if all the soil and seed conditions are right early summer or late summer seeding do equally well. If the soil is lacking in organic matter supply this before you lay it down to permanent pasture by plowing in a lot of coarse straw manure or a manurial crop. No other one factor is responsible for so many partial failures as the lack of organic matter in the soil.

Grasses for Permanent Pasture

For a number of years I advised farmers face to face and thus met them year after year. If my advice panned out only in expenses and not in income there were many frowns to face. I therefore devised a grass seed mixture that brought me smiles the first summer after seeding down and every summer thereafter.

We all understand that Kentucky bluegrass is the best and most important pasture grass for this section. But we should all know that this grass is slow establishing itself so as to give a large and continual supply of feed. Therefore we need grass in our mixture that will give feed while the bluegrass is being established.

In buying grass seed deal with a reliable party. Demand a guarantee that the seed is free from noxious weeds and that it will germinate, that is the germination should be above 85 per cent and the clovers should be above 95 per cent. This is important, as lots of grass seed on the market is full of bad weeds and much is very low in germination.

Here is the seed to sow to the acre: Kentucky bluegrass eight pounds, Canada bluegrass four pounds, red clover six pounds, alsike clover three pounds, redtop three pounds, timothy three pounds, and white clover one pound. On land high and dry you can drop the redtop and sow six pounds of timothy.

The summer after seeding the clovers will be the main feed. The second season the red clover will be less and the timothy will loom big with the alsike. The third year the blue-

The Home of the Feed that's Guaranteed

grass will assert itself and become stronger annually, while the rest will grow less except the white clover which is very permanent and very good though not very large in quantity. Then after this pasture is established remember like all other crops on the farm fertilization is necessary periodically.

What Does the Feed Weigh?

An inquirer tells me he feeds each cow a gallon of feed a day. His cows have dropped much in milk flow and are not doing well.

If that gallon were corn meal and cottonseed meal it would weigh seven to nine pounds and with a lot of good hay and silage might do for a cow giving twenty odd pounds of milk. But if that gallon is made up of bran, pulverized alfalfa and the like it would likely weigh two pounds and would cut a very small figure in nourishing a cow.

After reading the inquirer's letter I felt right sure that the cows did not have enough to eat to give any milk and I so wrote the man.

Telling a man the straight truth at times displeases him, but I just have a letter from a New Jersey man who puts it this way: "A year ago you answered my letter and told me I was feeding such a poor ration the wonder was the cows gave any milk at all. I did not like it, but this autumn I hunted up your letter and started following your suggestions in feeding and I never had my cows do better and look better in the five winters I have been keeping cows. I guess you were right and so I ask you more questions."

It is of course foolish and wasteful to feed all the cows alike, unless they all give the same quantity of milk or are supposed to, which is ridiculous. Generally in buying mixed feed one is getting from 20 to 24 per cent protein is desirable. Then in feeding use weight and not measure. If a cow gives ten pounds of milk she will need about three pounds of feed, while the cow that gives forty pounds of milk will need about thirteen pounds of feed. Always feed according to production and be sure you feed enough and a good quality feed. If the cows fail to pay for their keep then blame them and get rid of them as soon as you can.

C. T. A. Report

Coventry Cow-Testing Association

THE Coventry Cow-Testing Association finished its eighth year March 1, 1930, with 18 whole-year members and one part-year member. There were 659 cows in the Association during all or part of the year. The results in the Association for the year are as follows:

| Av. No. Cows | Lbs. Milk | Lbs. Fat |
|--------------|-----------|----------|
| 271.61 | 6614 | 265.5 |
| 131.17 | 7407 | 288.5 |
| 122.09 | 7840 | 308.3 |
| 80.13 | 8107 | 313.4 |
| 85.58 | 7322 | 294.8 |
| 54.17 | 7757 | 329.5 |

Ten herds with an average of five more cows exceeded an average production of 500 pounds of butterfat. Complete list of these herds follows:

| Owner | Lbs. Milk | Lbs. Fat |
|-------------------|-----------|----------|
| W. H. P. Toland | 7,181 | 112.2 |
| L. Solzberger | 6,158 | 106.1 |
| W. H. H. H. H. H. | 5,704 | 96.9 |
| W. H. H. H. H. H. | 5,169 | 89.8 |
| W. H. H. H. H. H. | 4,164 | 81.2 |
| W. H. H. H. H. H. | 3,580 | 55.0 |
| W. H. H. H. H. H. | 3,195 | 52.7 |
| W. H. H. H. H. H. | 2,719 | 33.7 |
| W. H. H. H. H. H. | 2,019 | 31.7 |
| W. H. H. H. H. H. | 1,626 | 30.9 |
| W. H. H. H. H. H. | 1,686 | 33.7 |

There are no known cures for abortion but there are precautions. The "Reducing Losses from the Abortion Disease" suggests ways to prevent losses. Ask the Mail-Box, Roberts Hall, Ithaca, New York, for Bulletin E 182.

CRAWFORD COUNTY CATTLE

We have at this time an unusually large supply of dairy cattle, purebred and grade of all the dairy breeds, offered for sale. Carloads of grades springing and fresh are, averaging \$15.00 to \$20.00 per head F.O.B. Several P.H. bulls offered at bargain prices. 10 head registered Holsteins, \$1,700.00 per head. All services are free in any quantity.

Crawford Co. Co-op. Dairy Imp. & Sales Assn., Market House, Meadville, Pa.

DAIRY CATTLE

Guernsey Bulls 3 to 17 months. Register. **HARRY G. BINKLEY**, Conestoga, Pa.

Holstein Bulls for sale, from an accredited herd, from calves to service-horn and 4½ bull. Also females. Crystal Spring Stock Farm, Littlestown, Pa.

DAIRY CATTLE

JERSEY BULL CALF—Dropped 12-22-'29. Solid color, excellent type, deep body, straight back out of Register of Merit dam that made \$25 lbs. milk with first calf at age 2 yrs. 2 mos. Calf sold by grandson of 28 lbs. dam. First check for \$100.00 takes him. Federal Accredited Herd and blood tested.

HIGHLAND FARMS, Greensburg, Pa.

AYRSHIRE CATTLE of the best blood lines. Herd T. B. Accredited. Animals of both sexes and all ages. Geo. B. McConnell, Wellington, Ohio.

TWO GOOD JERSEY heifer calves, 2 and 3 months, from extra cows. Accredited herd. W. E. McFARLAN, Furness, Pa.

HOLSTEINS—Good individuals backed by practical production records from a clean herd. Inquiries solicited. Croala Farm, Inc., Clinton, Pa.

REGISTERED JERSEY BULLS and heifers, 6 to 12 months old, accredited herd. Write us. J. M. MAIN & SONS, Shippensburg, Pa.

GUERNSEY BULL

One year old. This type and good breeding. Also a son of 1 plant's best type, a son of Langwater Cattle Co. from 185 pounds of fat in two a day milking with no silage. Priced very low. The owner does not wish to keep a bull on the place. For further information, address: F. P. KILLIP, Mer. Dundee Farm, Sewickley, Pa.

GUERNSEY BULL ready for light service. Also bull calves out of 1012 fat, granddam 1,011 fat. We can spare two or three females. Accredited and Blood-Tested. **WILLIAM BAUMGARTEL**, Sewickley, Pa.

FOR SALE Purebred Holstein cows and heifers. Fully accredited. W. E. McFARLAN, Furness, Pa.

REGISTERED BROWN SWISS BULL CALVES (born May 6 and Nov. 27). Good individuals. Also bred to a Grand Champion. Contact Lake, Pa.

GOATS

Registered Swiss & Nubians, from heavy milking thoroughbreds. Big Bucks and does, jacks, trips, heads. Lloyd B. Goldsborough, R.R. Moulton, Pa.

SCARFF'S BERRY PLANTS

Crown in the Heart of Ohio

1400 acres of most fertile soil. Small fruit plants and ornamentals our specialty. Healthy, vigorous stock.

Viking Red Raspberry—Latham Red Raspberry—Van Fleet Red Raspberry—Youngberry (Young Raspberry)—New Logan Black Cap—more resistant to mosaic—Gallia Beauty Apple—red strain of Rome. These outstanding new varieties and the best of the standard kinds are fully described in our new catalog.

EVERGREENS—Beautify your home with Scarff's Evergreens—Flowering Shrubs—Trees—Roses—Perennials and Hedge Plants. Our assortment of varieties is complete and prices reasonable.

SCARFF'S SEED CORN

CASE—Very early, heavy yielding, deep grain, small cob, medium stalk, fine feeding corn.

CLARAGE—Mid-season variety, produces well, good grain, medium to large fodder, general favorite. Also, Blue Clarage, White Cap, Early Mammoth, Reids Yellow Dent and Enslage varieties. Send for FREE Copy of our Catalog.

Everything for Farm and Fruit Garden

The MARKET PLACE

By W. R. WHITACRE

THE production of Iceberg lettuce has increased more rapidly than that of any other vegetable. It has reached a point now where the growers have been forced to control their output and to stimulate consumption. Through their organization they limit the number of carloads that can be shipped daily and have begun an extensive advertising campaign.

I have clipped a number of the advertisements from Philadelphia and New York newspapers and understand that they are appearing in all sections of the country. Vitamins—Concentrated California Sunshine are some of their selling points. There was one, however, that appealed to me. I never could see the sense in eating a salad with a fork as was supposed to be correct and now it seems that I was right.

A Great Relief

"Do you eat your head lettuce with a knife?"

"If you don't you are missing a lot of fun, for to lay open a third or a quarter of a solid head of lettuce with a salad knife is a real pleasure. And it is good form, too. We have the word of a famous book on etiquette for that."

"In Arizona and California, the home of head lettuce, it is universally cut with a knife at the table. And that custom has spread to the East is attested by the fact that three of the great silversmiths of the country are now bringing out a lettuce knife and fork."

"So those people who have been deterred from eating lettuce, because of the difficulty of handling it with a fork alone, may now enjoy one of the most healthful foods known to man without the slightest danger of scotting it across the table."

Advertising Pays

Advertising does stimulate consumption and the advertising of farm products will grow. The Western producer is more progressive in his marketing practices than his Eastern competitor because he has been forced into it by his distance from market. The greatest advantage that the grower in nearby states such as Pennsylvania and New Jersey has is this proximity to city markets, but this very asset is being turned into an actual disadvantage by the careless handling, packing and grading along with a lack of cooperative interest. There is a tendency toward better grading of eastern products and the time will come before long when their superior "freshness and flavor" will be advertised through the cooperative effort of their producers.

Complete Fertilizer for Oats

It has been recommended to fertilizer users that phosphoric acid is the most generally lacking element in our soils, and many soils do respond readily to an application of superphosphate alone. Especially is this true when a soil is turned and put to a grain crop. However, a phosphate does not seem to have as much effect when applied to a crop planted on a soil that has produced a cultivated crop the year before. Especially is this the case where a corn stubble is planted to oats.

Two years ago, I sowed oats on a corn stubble and on a part of the field I applied a twenty per cent superphosphate and on another part I used a 2-8-5 fertilizer. It was only a short time until I could notice a marked difference in favor of the 2-8-5 fertilizer and this difference kept up favorable to the complete fertilizer until harvest. I am sure that the difference was sufficient to pay a large percentage on the extra cost of the 2-8-5 fertilizer.

A. J. Legg,
Nicholas county, W. Va.

A fine well-kept farm..

A car kept fit with Ethyl

YOUR automotive equipment, in these days, is just as important to successful, economical farming as anything else you buy.

Use Ethyl Gasoline and get the most out of it. With Ethyl, you run less in second, which saves fuel. There is less wear and tear, less engine strain, which slows up depreciation and reduces repair bills. There's less frequent lay-up for carbon removal, which saves time and money.

And in those small, old cars ("mud cars") used for rough going, Ethyl makes just as much difference as it does in new, more expensive cars.

Ethyl improves the performance of any gasoline engine because it is good gasoline plus the Ethyl anti-knock compound developed by General Motors Research Laboratories to make gasoline a better motor fuel.

Look for the familiar Ethyl emblem. It represents a premium fuel that is a real economy.

Ethyl Gasoline Corporation, New York City

Wherever you drive—whatever the oil company's name or logo associated with it—any pump bearing the Ethyl emblem represents quality gasoline of anti-knock rating sufficiently high to "knock out" that "knock" in cars of ordinary compression and to develop the additional power of the new high-compression models.

"B" BATTERY

COSTS ARE LOWER

WITH

EVEREADY LAYERBILTS

YOU SAVE in two ways when you use an Eveready Layerbilt "B" Battery. A few cents extra bring you from 25% to 30% longer life than is possible with an old-fashioned "B" battery constructed of individual round cells. And you are not subject to the risk of having trouble caused by broken connections and other weaknesses in the "B" battery.

Eveready Layerbilt "B" Batteries are constructed of flat cells with contact direct, from cell to cell. Waste space is eliminated and more active material (energy-creating substance) put into the Eveready Layerbilt. You get all "honey" and no "comb."

Eveready Layerbilt "B" Batteries come in two sizes, the Medium Size No. 485 (price \$2.95) and the Large Size No. 486 (price \$4.25), which is illustrated on this page. Eveready Layerbilt construction is unique and is patent-protected. Only Eveready builds Layerbilts.

Economy and greater dependability are assured when you use an Eveready Layerbilt "B" Battery.

NATIONAL CARBON COMPANY, INC.

General Offices: New York, N. Y.

Branches: Chicago Kansas City New York San Francisco

Unit of Union Carbide and Carbon Corporation

We also make Eveready Raytheon 4-Pillar Tubes—another revolutionary improvement in radio. With their patented 4-Pillar construction, they give an entirely new standard of performance. To get the most from your present radio set, put a new Eveready Raytheon in each socket. Nothing else like them.

Here is the exclusive Eveready Layerbilt construction. Only five solderings and two broad connecting bands, all other connections being made automatically. Waste space eliminated. Layerbilt construction is a patented Eveready feature.

Here is the inside story about every 45-volt "B" battery assembled of separate, individually sealed cells. There are 30 independent cells, connected by 29 fine wires and 60 soldered connections—89 chances for trouble. Note the amount of space wasted between cells.

Radio Batteries

Farm Facts and Fancies

By ALVA AGEE

THE chairman of the Federal Farm Board, speaking of the wheat situation, says: "It seems to us that the solution of this problem is to adjust our production to domestic demand plus some of the premium (high-protein) wheat just mentioned. There is no possible solution of this problem unless we get the cooperation of the growers themselves. No other industry in the world blindly produces without any attention to potential market possibilities."

Farming is the only industry in this country that is carried on by millions of small capitalists. We want it so, and the price we pay is the result coming from independent planning on all these farms. No one knows surely what the others will do, and each plans for the best income he may get from his land. That usually means that each acre must be made to produce something. He would drop wheat if he could provide with profit. He does not see that something to substitute.

He believes that he must keep his land, his horses, his farm machinery and himself busy, or go to the wall. We can blame millions in a bunch, it may be, but pick out any individual you know, with a family to keep, probably with some interest to pay along with taxes, without the least certainty that acreage is to be effectively restricted, and see whether you can fit blame upon him for making his acres produce stuff for market. I know that Chairman Legge is right about restriction, but what should this individual, whom you know and have picked out as a single instance, do under present circumstances?

An Uncertain Crop

The potato, which was at home in a cool climate, has drifted about over much of the earth, accumulating diseases as it went, and according to the Ohio Experiment Station it is now subject to attack by more than forty of them. Over half of these diseases are found in Ohio or adjoining states each year. A successful grower has a good deal to think about. The most disheartening part of his experience is to get seed that is not free from disease when he has paid for something he believed he could trust. It is not so much the money put into the seed as the crop damage that follows. The former is relatively a minor matter.

Certification is a big help, and it is going to be far more so when all growers of such seed and all certifying officials use the care that some are now using. I think that producers of certified seed in cool latitudes have a much easier task than those in warmer regions.

I used to think that our potatoes "run out," but our scientists now say that diseases drove them out. Maybe so, but I am pretty sure that the potato, liking a cool climate, and being grown year after year in a warm latitude, would show that it was suffering from general debility if no disease ever attacked it.

Mystery Stories

When I go to the public library for books there are far more people in front of the shelves in the section devoted to detective and other mystery stories than in any other one place in the library. They are in my way. The production of books of this class is going on at a prodigious rate, as magazines devoted to book notices and reviews show. Writers are trying to meet a big demand. This sort of reading seems to fit in with moving pictures, radio programs, motor cars and airplanes. The public taste is for action, and if one were engaged in meditation he would be in danger of being run in for examination by an alienist.

Most movies do not appeal to me at all, and so I don't go, and most

A good farm pair. They are owned J. C. Grove of Indiana county, and weigh about 3,000 pounds.

radio programs are pretty light weight, but one can get considerable mental exercise from a clever, well-written detective story. I can understand the justification for such reading by elderly people, but never will amount to much more than they now are, but there is so much literature that young people need their mental training that there is a serious loss to them in the competition for their time and attention to the average movie and mystery story offers. This paragraph has not been written with the thought that it will do anybody any good. Youthful readers will rate it as the highly important view of some one older than they are.

The Dark Side

I should like to call attention to some disquieting features of the world today. The Russian leaders have control of their country's wealth and finance constant propaganda and the discontented of other countries. They believe in Soviet principles and try to undermine the governments what they class as capitalistic nations. Zeal, backed by whatever money is necessary, exerts constant pressure.

There is no sound basis of understanding among the nations of western Europe, each one believing that the others want to have it at a disadvantage. Great Britain's control of the British Empire has weakened a point where the empire is a loose association of widely separated countries that is less and less capable of helping to maintain order in the world.

When capitalism fails to provide work at good wages, the system is questioned by many, as always has been the case, and millions expect to live to see the day when it will be replaced. They point to the poverty and squalor that exist under the capitalist system in many countries and hold that the argument ends there. The tremendous industrial activity in our own country the greater part of the time since the war has blocked agitation, but unemployment in Europe is continuously serious.

I believe that there is turning a-plenty ahead of Europe and America though it is easy to overestimate immediate effects of unrest. Things move slowly but today, for the first time, agitation to promote change is adequately financed. We can never make nor unmake the world, but we have plenty to do to better conditions within our own country. Our concern is that we attend to our business, and that we stay fully equipped to keep others from attending to it for us. That means preparedness. It is a pity, but I reckon it is wise to wish all nations would cut out of their battleships, but preparedness probably something considerably different from big battleships.

The newer concentrated fertilizers prove satisfactory if used in small quantities than the less-concentrated fertilizers and if well distributed the soil.

4-SPEED TRANSMISSION . . . A wide range of speed and power

NEW SPIRAL BEVEL GEAR REAR AXLE . . . Strength, reliability and long life

New features of the FORD TRUCK

THE Ford 1½-ton truck is a haulage unit carefully designed to provide unusual performance under a wide variety of conditions, and long, reliable service at minimum cost. With 4-speed transmission and 40-horse-power engine, the Ford truck has a remarkably flexible range of speed and power.

Rugged strength is a feature of the Ford truck. An important example is the new rear axle. It has a special spiral bevel gear, with straddle-mounted pinion. The axle shafts are heavier than formerly, and because of the three-quarter floating type of construction, they serve only to turn the wheels, without carrying any of the weight of truck or load.

The new front axle and spring are heavier and stronger, as are front radius-rod, king-pins, wheel bearings and thrust bearings. Brakes on the front wheels have been enlarged to the same size as those on the rear wheels, providing increased braking area and a high degree of safety. Brakes are of the mechanical type, internal expanding, and all are fully enclosed.

Dual rear wheels are available at small additional cost. Balloon tires of one size are used throughout, with the dual equipment, so that all six steel disc wheels and tires are interchangeable all around. Only one spare wheel and tire need be carried.

LARGER BRAKES . . . Providing a greater degree of safety

You'll "make the grade" with a "Caterpillar" Tractor

SURE—you can make those tough grades in your orchard with a "Caterpillar" Tractor. Let in the clutch—its generous, effective power can take you up—even the soft, sandy hills—up with heavy loads of deep-set tools—killing weeds—saving moisture—or shattering subsoil.

Make the grade—with dependable power and traction that save vital days. Broad, long tracks that tread over wet spots—find sure footing in sand or loose soil. Nimbleness to work close to trees and in tight corners—compact to go under branches.

You'll make the grade, too—of rush seasons—of spray times—of thoroughness—of saving wages—making better markets with bigger yields—with a "Caterpillar" Tractor.

Prices—f. o. b. Peoria, Illinois

CATERPILLAR
TRACTOR

By R. P. KESTER

HOW long will that new merchandising institution, the roadside market, continue to be popular? This question came up in the course of a conversation with a friend the other day. I have been thinking about it since. To my mind it will continue as long as people keep house and cook their own food, and the operators of roadside markets furnish fresh, high-class products at reasonable prices.

Not all wayside market proprietors are worthy of continued patronage and success. Many of the little stands are supplied with so few products and these in such meager amounts and ordinary quality that the passing trade is not attracted and will not stop. Often there is no provision made to attract the approaching traveler, nor to display what is offered for sale.

Of course, a make-shift place for display and sale may be used temporarily to try out the possibilities of a location. But something decent and appropriate must be provided if the trade is to be held and increased. This means ample parking room, shelter, display, tables and shade if possible. Our first two days' sales were conducted over boards laid upon two barrels.

At Neshaminy Gardens we found that the bulk of our trade was from regular customers. Of course we had some of the "touch and go" kind—those who came our way but once, bought and passed on. But most of them were "repeaters". Some of them coming once or twice a week throughout the season. That is the kind of trade that is dependable and worth while. But the motto of the seller must be, "First-class stuff at fair prices." Those who start out with the idea of gypping the public in the belief that the buyer is only a chance victim and will not be seen again, are right in regard to the last part, but such persons have failed before they begin.

Produce for the wayside market should be gathered the same day it is sold, and preferably several times a day. This is especially true of sweet corn, spinach and such other stuff as will wilt or deteriorate rapidly. It is the preservation of the "strictly fresh" quality that makes success possible for this kind of market. We have had many people say they thought there must be some particular quality in our soil that made our sweet corn, peas, beans and melons superior to those bought at the green groceries. We never argued the matter with them, but we knew it was because our produce was several hours fresher than what they were used to.

I am confining my remarks to this subject this time because this is the season of year to begin preparations for conducting a roadside market. Plans for raising quality crops should be made now. No general list of suitable crops for every locality can be given. A few things are universally applicable—corn, tomatoes, peas, etc., but every person must study the character of the people who make up the traffic of a given highway.

As a side line flowers would prove profitable in some places, while in others they would not sell well enough to pay for the trouble. The same might be said of many other things. You must not only "know your stuff," but you must know your people as well.

Finally, put up signs, be neat, be courteous, and—above all—be thor-

oughly honest. If you are all this, and more, and have a good location, you will sell goods.

Friendly Talks

By Edgar L. Vincent

I HAVE been away on a long journey. It was far from a pleasant journey with many a quagmire and rough place, thorn infested and beset with briars and all sorts of uncomfortable things. I was snatched away from the things I enjoyed doing. Life suddenly took on an entirely new phase; for a time it seemed uncertain whether I would ever get home. I wonder if this is not like all life, full of lights and shadows, often beset with things that hedge up the way and make life unhappy always stepping off into the dark, never knowing what the future is to bring forth.

Now is it necessary that life should be such a blur of pleasure and sorrow, so mingled with sunshine and shadow? No, I think not. Now I am coming back home, and at every step of the way it seems to me that if we would all take more pains to make life more beautiful for each other, to clear away the pitfalls in each other's way, to wipe away the tears from each other's eyes it would not be long before this would be a better world to live in.

It is splendid to think that there are so many brave men and true women who are now giving the very best there is in them to make life's pathway easier for others, to tear away the briars, to clear away the stones and cheer the hearts of the lonely. This is one thing that has eased my way back home and given life a sunnier aspect. Wherever there is a troop of boys possessed with the idea of doing right or a company of girls banded together to do good, there the morning star shines more brightly, and hope glows more securely for the days to come.

Now, we can all do something at this. In fact, this is the greatest reason for our being here; to try to brighten the pathway for others, to cheer the way for all the sorrowing, to live the good, the true, the heaven blessed life; and if we all do this the day will come when the Big Lamp will be lighted when Some One will be sitting in the beautiful chair and we shall hear Him say, "You have done well; you have helped me. I thank you."

Free Bulletin

FOR the benefit of new owners of combined harvester-threshers as well as the more experienced operators, the U. S. Department of Agriculture has published Farmers' Bulletin 1608-F, entitled "The Operation and Care of the Combined Harvester-Thresher."

This bulletin gives simple directions for starting a new combine, regulating the speed of the cylinder and other moving parts, adjusting the reel and platform, and for the care of the machine after the harvest is over. It also describes the various attachments which may be purchased, such as grain tank, wagon hitch and sacking attachments, straw spreader and buncher, windrow harvester, and picker-up. This bulletin may be obtained free, while the supply lasts, from the Office of Information, U. S. Department of Agriculture, Washington, D.C.

Soil Organic Matter

By J. W. WHITE

ALL of us who are familiar with the many problems involved in the economic production of farm crops are free to admit that the most important factor concerned is that of maintaining the organic matter and nitrogen content of our soils. Grant this statement as the gospel truth, and it must certainly be, then what are we going to do about it? How are we going to solve this vital problem in the face of a constantly growing scarcity of farm manure?

The answer to this question becomes the theme of my story. As you might suppose, the soil research investigator is concerned primarily with what goes on beneath the surface of the soil, while the farm crops man is most concerned with the crops above the ground. If this be true, then the two working together ought to be able to produce the goods—to find out a few things about the secrets of old mother earth; what she demands and why—how she demands it and when. Now if the two of us can solve why, then that is bound to teach us how and when.

Last summer a party of fourteen college professors from eleven of our leading agricultural experiment stations were privileged to study agriculture in western Europe. The writer was included in this group and we traveled away from the beaten path of most tourists. I shall not at this time enumerate the many unusual things we saw and learned.

Among the many places of interest we visited was a pilgrimage to Darmstadt, Germany, the birthplace of Baron von Liebig, the father of agricultural chemistry. While visiting the humble little house of his birth and his original chemical laboratory, there came to my mind the statement he once made, in 1859, concerning the American farmers: "The deplorable efforts of the spoliation (robbing) systems of farming are nowhere more strikingly evident than in America, where the early colonists in Canada, in the state of New York, in Pennsylvania, Virginia, Maryland, etc., found tracts of land, which for many years, by simply plowing and sowing, yielded a succession of abundant wheat and tobacco harvest."

"We all know what became of those fields. In less than two generations—they were turned into deserts—when it ceases to yield him sufficiently abundant crops he simply quits it and with his seed and plants, betakes himself to a fresh farm."

How true this statement was and unfortunately still is to a certain extent, for many farmers are unwittingly removing from their soil much more than they return and this is the road to soil depletion. Independent of the nature of the fertilizing materials used, and this includes farm manure, the ultimate residual organic matter content of the soil depends on the cropping system used. It is well known that soils in permanent grass invariably contain a higher proportion of organic matter and nitrogen than the same soil type in a system of cultivation. Advantage of this fact is taken in the manner of planning grain rotations, that is to alternate the periods of cultivation with a period during which the soil is left undisturbed. Thus in the four-year grain rotation, sometimes called the "Dutch rotation," followed in the southern half of Pennsylvania, there is a period of 33 months from the time wheat is seeded in the fall till the soil is plowed for corn, when the soil is untilled.

During this "rest" period there is, under a system of proper management, a pronounced recuperative effect which tends to balance the organic matter and nitrogen rapidly lost during the period of cultivation. In other words, the less the cultivation the greater the accumulation of soil organic matter, and why?

During the time the soil is in wheat and grass the old roots are being utilized by soil bacteria as a source of energy. In the absence of an excess of air (oxygen) the organic matter formed both in the bodies of the organisms and the root residues tends to accumulate rapidly. Now when the soil bacteria are utilizing the roots they are fixing the nitrogen from the air. This is due to the fact that soil organisms which have this power such as azotobacter contain in their bodies both carbon and nitrogen. The carbon is supplied from the roots and the nitrogen is taken from the air. For every

which are very soluble and much of them are lost in the drainage water before the corn crop can use them. In fact, where a heavy clover and timothy sod is plowed down there are manufactured more nitrates than the corn crop can use.

At the same time the roots and stubbles decay very rapidly and the reserve organic matter, therefore, suffers severe loss. The longer the system of plowing and subsequent cultivation is continued the more quickly the soil becomes depleted. In other words, the period of plowing is similar to the process of burning the wood which results in a bonfire, eventually leaving only the ashes of your organic matter. The sod period may be likened to the preparation of charcoal where there occurs a building up process with very little loss. It is easy to see now why we like to follow a sod with such crops as corn or potatoes, for these crops are capable of making the best use of the nitrates formed during the breaking down process.

The grain farmer manages his soil so as to have a good sod, for therein lies his salvation so far as soil organic matter and nitrogen are concerned. The old rotation experiment at State College has released to me this valuable secret among many others. The soil which is supplied with lime, phosphorus and potash has been able to maintain its organic matter and nitrogen throughout the 40 years of its life history. The building up sod period has balanced the tearing down cultivated period and there has been established an economic balance even where no animal manure has been used.

When I speak of nitrogen I, of course, mean also organic matter, for the soil nitrogen occurs in the soil as organic matter. The Minnesota Agricultural Experiment Station found that continuous cultivation of wheat resulted in an annual loss per acre of 175 pounds of nitrogen in excess of that removed in the crop. Let me bring this home to you.

This annual loss of nitrogen was equivalent to that contained in 175 bushels of corn or 123 bushels of wheat. To supply this amount of nitrogen in nitrate of soda would require 1,130 pounds or about \$35 worth of nitrogen. The Cornell Agricultural Experiment Station found that in a five-year grain rotation there was an annual loss of 5.4 pounds per acre of nitrogen and where the soil remained fallow for five years and cultivated there was an annual loss of 89 pounds per acre—quite a difference, isn't it? Now let us turn to our old reliable—the Pennsylvania fertility plots (1881-1920)—and bring forth a few more lessons about soil organic matter.

The grass strips which divide the old plots have been in permanent grass since 1867 when the plots were originally laid out. From 1867 to 1881 these old plots were used for miscellaneous tests. Since then we have carried out a definite fertility experiment. The writer found that after 55 years the grass strip soil contained 16,299 pounds per acre of organic matter and 815 pounds nitrogen in excess of the plot soils in grain rotation. Even where the rotation soil had received 120 tons manure in 40 years, the grass strip soil contained over 12,000 pounds more organic matter per acre—quite an argument for sod, isn't it?

At the Snow Shoe experiment fields a grain rotation and a permanent bluegrass pasture have been maintained side by side and treated with the same fertilizer materials. (Continued on page 38.)

America's oldest soil fertility experiments at State College, Pa. A study of these old plot soils has furnished us many valuable lessons on how to use the land and not abuse it.

THE DEBENTURE PLAN

PRESIDENT LEGGE of the Federal Farm Board has rendered a public service by saying that the export debenture plan, which accompanies the Senate Tariff bill, "will not work" and by showing why it will not. Foreign nations will do just as our country has done, provide for embargoes on commodities dumped on them by means of export bounties or similar government favors. Probably if the debenture plan could be passed and put into effect the first to call for its repeal would be those who are now advocating it, for they have a direct financial interest in maintaining our export trade.

CONQUERED

ANOTHER foe succumbs to science, for the gypsy moth is about to sing its swan song in New Jersey, we are officially informed. Ten years ago this pest first appeared in the state. It was met with plans for its extermination and during the first season more than 2,000,000 egg clusters were destroyed. The following summer thousands of acres of tree growth were sprayed. Last summer only one small colony, containing less than 100 egg clusters, was found and the complete extermination of the insect seems assured. Here is at least one case where it was not necessary to learn to live with an invader.

GRADING LIVESTOCK

A BILL authorizing the Secretary of Agriculture to establish standards for classifying and grading livestock and livestock products has been introduced in Congress by Representative Haugen of Iowa. The Department of Agriculture believes that official grades for livestock are feasible and are desired by the trade. There is no question about the desirability of grades and standards for any farm product, but there is often the misfortune of the products not growing to conform to grade. Even official wool grades, which would appear entirely practicable, have never achieved any great place in the trade. Grading livestock officially is like many other good ideas, excellent to contemplate but hard to execute.

FROM LIFE

SOME years ago a boy who worked in a butcher shop was discharged by his employer. He had only \$13, but with that he

went to a packer and proposed to open an account as a retailer. The packer had confidence in the boy's honesty, so allowed him to buy on credit, telling him to take the meats and see what he could do with them. He sold them and came back for more. Later he found a vacant shop and with the credit he had established was able to secure it and start in business. The packer continued to back him. Today that boy is a retailer with a good store in a fine community. Maybe lack of capital is not so much of a drawback to a start in business as is the lack of some other things.

FRUIT REPORTS

FRUIT growers will welcome the decision of the United States Department of Agriculture to report fruit prospects throughout the season. The first report, issued March 22, indicated that the peach crop has been somewhat damaged by cold weather, especially in the central and northern states. No severe damage is noted to apples and pears, but it is too early to be sure about this. Cherries have suffered in some sections, but the evidence at hand shows no widespread damage to this crop. The need of such reports has been felt by fruit growers, who will appreciate all the information available on the progress of the crops as the season advances. No schedule of the reports has been issued, but it is stated that they will be made "when conditions warrant."

TAX CONFERENCE

THE tax conference held last week under the leadership of the Pennsylvania State Chamber of Commerce brought out several points on which most speakers agreed. They are:

- 1—That taxes have risen rapidly in the past ten years.
- 2—That taxes are not likely to be reduced very much.
- 3—That real estate is bearing too large a share of the present tax burden.
- 4—That present political units are too small to insure efficiency in assessment and collection of taxes.
- 5—That there is much economic waste in present methods of administration.

Many references were made, by speakers not representing agriculture, to the heavy burden of taxation on farm real estate. It is good to see that students of taxation and even commercial organizations are recognizing this situation.

MORE THAN ENOUGH

IN a recent press bulletin Dr. E. B. Forbes of the Institute of Animal Nutrition at Pennsylvania State College says that "the feeding of limestone to cows has not been shown to be necessary under any known conditions." That would have been sufficient to state a scientist's conclusion in the briefest form, but he proceeds: "The inclusion of pulverized limestone costing \$4.50 a ton in cow feed selling for \$50 a ton, however, is held in great favor by some manufacturers. It is said that Moses smote the rock with his rod and that water came forth abundantly. Can it be that the feed manufacturer who smites the rock with his pulverizing mill and sells the ground product for feeding to cows is merely seeking to emulate Moses?"

Such words are unbecoming a scientist who knows or ought to know that the feed manufacturers were not the originators of the use of limestone and other mineral substances in mixed feeds. That originated with and was recommended by those who were regarded as scientists, those who were supposed to know what is essential to the proper feeding of animals. If any substance in mixed feeds is injurious or unnecessary it is the duty of scientists to ascertain and publish the

facts. But it is not their function to assail manufacturers who have followed in good faith the ideas for which the scientists themselves were primarily responsible.

ECONOMICAL POWER

TWO years ago Wayne Dinsmore, Secretary of the Horse Association of America, made a bet that within five years wheat would sell at 75c per bushel on the Chicago market. He thinks he will win the bet, basing his opinion on the increase in man-food acreage resulting from the decrease in horse-feed acreage. He says that all those who are threatened with overproduction should "vigorously support horse and mule production and use," because "every acre diverted from animal power is a potential competitor of their own industry." He advocates the use of animal power "whenever it is efficient and economical," and that is a sound principle. But there may be a difference of opinion about what is economical. Some farmers find it is more economical to save time with mechanical power than to save money with horses—and vice versa. In the end the most economical power will survive, no matter what it is, on farms and elsewhere.

TO SOW LESS WHEAT

A SUMMARY of the expressed intentions of 50,000 farmers on any subject is of interest, but it is of more than usual interest this year in view of the campaigns to reduce production of wheat and cotton. Last week the Crop Reporting Board reported on intentions to plant principal spring crops. The average of all crops indicates an increase of two per cent in acreage but a decrease of 3.7 per cent in the area seeded to spring wheat. The Federal Farm Board naturally and modestly claims credit for this decrease, but probably the prices of wheat and flax have had more to do with it than any propaganda. With a shortage of flax an increase of 27.2 per cent in acreage is indicated. All "intention" figures should be taken for what they are and not for actual crop areas. The weather may change any earlier intentions into different realities.

THE DREAM OF CONTROL

WE were in Western Canada a few years ago when the present great cooperative organization known as the Canadian Wheat Pool was being formed. At that time the old Saskatchewan organization, an efficient and successful cooperative marketing agency, had not been taken over by the Wheat Pool. We discussed with leaders in that movement, both at headquarters and at different points in the West, the objects and possible advantages of the larger organization. In every discussion the idea was expressed that a single great agency could exercise some degree of control over the market. That idea cropped out in every conversation, and we didn't gain in the favor of our Canadian friends by saying that we regarded such control an impossibility. The present condition of the Canadian Wheat Pool, the credit of which has had to be supported by the guaranties of three provincial governments, is the result of an attempt to carry out the idea that some degree of control is possible. Soon or late such an idea is bound to cause trouble and it has brought plenty of it to Canada during the current crop year. The lesson is perfectly clear. Cooperative marketing organizations should stick to their business of marketing and forget the plausible but impossible dream of control. In this country the idea of control exists to some extent. It is expressed in different ways, but still it is evident. The sooner its fallacy is realized the better for all concerned.

AT the annual meeting of members of the Cedarville Auction Market last Thursday evening an increase of nearly 38 per cent in the number of packages sold at auction over the previous year was reported for this past season. In 1929 this market handled 169,000 packages as compared with 63,761 during 1928, and conducted a \$326,424 business as compared to a \$156,715 business during its first year of operation.

This market was open 129 days during the past season and 26 different vegetable crops were sold to 24 different buyers. Buyers have been attracted to this cooperative non-profit farmers' auction market and last year paid 18.63 per cent more for produce than the average New York market quotations on New Jersey produce.

When the market opened in 1928 members had invested \$1,500 in land and buildings, the following year two additional loading platforms were built at a cost of \$1,000. The market has already paid off this debt and has a surplus of \$1,000 with which it is planned to construct loading sheds this spring to store produce for buyers previous to loading for shipment.

The new directors of the association are as follows: Howard Sheppard, Myron Powell and Joe Nardelli were elected for a three-year period. Harry Fisher and Ralph Husted will serve for two years, and John Taylor and Wyle Middleton will act on the board for one year.

A HORSE and buggy slowly plod along a muddy road to get the weekly farm supplies at the village. In a winter evening the family gathers about the stove in the farm-house kitchen to read by dim oil lamps and patiently wait until spring releases them from their bondage.

That picture of farm life has passed into the dim past, and today we find improved roads, automobiles, trucks, radios, electricity, heating systems and other modern improvements in the farm homes. Last summer a survey of Burlington county agriculture was completed to find the changes in acreage of different agricultural commodities produced by these New Jersey farmers since 1925. But this survey also pointed out some changes in rural life.

On 1,283 farms in the county, which includes nearly all farms over 20 acres in size, there were 699 radios. Over half of those farmers, many of them producers of highly perishable crops, may now at noontime receive full information pertaining to the market situation for that day in the New York City and the Philadelphia markets. In the evening a famous symphony orchestra furnishes them with dinner music, a great singer greets them in their home and entertains them, and news of the world reaches them as soon as it does their city cousins. They are no longer shut off from the world.

Plodding teams have been replaced by 934 trucks on these farms. They have brought the city markets to farm doorsteps. The pleasures of the average city dweller were found accessible to these New Jersey farmers, as on the 1,283 farms there were 1,334 pleasure automobiles, more than a car to every farm. Production has been speeded up by power machinery and the use of 668 tractors, while 898 gas engines were found in operation on the farms. Modern conveniences seem to run parallel with the extension of rural electric lines. Of the 1,283 farms 405 had electric lights, 534 running water and 486 heating systems.

RECORDS kept on 4,710 acres of tomatoes in New Jersey last year show that total yield is decidedly influenced by the time of planting. More and more growers are planting early in the field because of this fact. In 1929 those tomato plants placed in the field between May 1 and 15 produced an average of 7.4 tons to the acre. Those planted between May 16 and 31 yielded nearly as much or 7.3 tons. But planting made June 1 to 15 gave an average yield of only 5.7, while later June plantings yielded only 4.9 tons to the acre.

A STATEMENT issued by the New Jersey Bureau of Markets gives the acreage which vegetable growers in the state intend to plant this year as compared with the past season. A slight decrease in the acreage to be planted to cabbage, egg plant, spring lettuce and beets is reported,

New Jersey Farm Comment

By G. W. HARRIS

but in all other cases the same acreage or a slight increase is expected to be planted this spring.

If we could only learn what the weather intentions for the coming season were, or what the Mexican bean beetle planned to do this season, some of the gamble might be excluded from vegetable production.

THE necessity of proving herd sires is strikingly emphasized by comparisons made by E. J. Perry on six Sussex county bulls. There were six bulls on which dam and daughter comparisons could be made based on the cow testers' figures.

Three of these bulls increased milk production on an average of 17 per cent and the other three lowered it on an average of ten per cent. One sire increased production 22 per cent (2334 pounds of milk). His daughters averaged 12,823 pounds of milk and their dams 10,489 pounds.

What might happen if the sentimentalists were held up

The year records on the first six or more daughters are needed to measure the bull's worth and one that is able to maintain or increase high production should find a home in a safety bull pen and be kept from the butcher. A dead site of this type cannot improve a herd.

THE market report sent out by the State Department of Agriculture last week contained some information on early potato plantings which may interest New Jersey potato growers. In regard to Maine potatoes they say:

"The State of Maine has the largest commercial crop on record. To date, there have been 45,000 cars shipped which is around 3,000 cars more than the total movement of any season previous. On March 15, it was reported by authorities in Maine that there were close to 11,000 cars still on hand in the commercial areas. If this statement turns out to be correct it means that Maine will have a total movement of 55,000 cars for the season of 1929-30. Maine is certainly dominating the potato situation this season. Last season at this period, there were about 36,817 cars yet to be moved from all states before the end of the season. This year on approximately the same date, there are around 20,000 cars left in the three states of Minnesota, Idaho and Maine.

"It is estimated by commercial authorities that more than 50 per cent of the potato crop in Kaw Valley, Kansas, has been planted to date. . . . Increased acreage is expected in the Kaw Valley, and the total area is estimated at 13,500 acres, an increase of about five per cent over last season.

"It appears that the acreage commercial growers intend to plant in the second early states (which includes New Jersey) is about five per cent greater than the 1929 acreage, but nearly 17 per cent less than the exceptionally large acreage in 1928."

er than the 1929 acreage, but nearly 17 per cent less than the exceptionally large acreage in 1928."

MANY fruit and vegetable growers throughout the country have equipped their farms with sprinkling and heating systems to combat Jack Frost's unseasonable arrival and to prevent the

damage that nearly always follows. The New Jersey Experiment Station now suggests that cranberry growers equip their bogs with sprinkling systems to provide adequate protection against frost damage.

As the bogs are always located in depressions where there is no air drainage cranberries are frequently hit by frost. In New Jersey this danger exists as late as the first half of June and as early as late August. Although many growers flood the cranberry bogs when frost threatens, this practice is not always possible.

Studies carried on by the Experiment Station last year at Pemberton have shown that sprinkling water on the cranberry vines maintains a temperature of 31 degrees or more, even when the temperature on nearby but unsprinkled vines drops as low as 20 degrees.

BATTERY BROODING

ESSEX COUNTY, New Jersey, is a metropolitan county which has nearly one million people residing within its borders. Another half million folks live within six miles of its boundary, in Passaic, Hudson, Union and Morris counties. Other millions of people live in New York City, Brooklyn and Staten Island, all of which are within 20 minutes drive from the eastern border of the county.

This mass of people makes a wonderful retail market for fresh poultry products (including broilers) but also causes land values in the county to be very high.

The 95,000 laying birds in this small square-mileage county are kept on land ranging in value from \$800 to \$15,000 per acre. Most of the poultrymen have no range for brooding chicks and keep the laying birds confined during the entire year. This method of poultry farming means that labor is an important item in the cost of a dozen eggs as well as in the cost of raising pullets for replacements. It also means that raising disease-free pullets requires plenty of head work.

The introduction of batteries (so-called poultry apartment houses) has been a godsend to poultrymen of Essex county and they have quickly adopted their use. On congested poultry plants it is necessary to get the bulk of the chicks started early so that they are well grown before the

period of soil contamination (and fly season) comes along. Then, too, the poultrymen have found that with hatching the majority of chicks in January, February and March they are better able to keep a fairly even egg production for their retail trade. (Ninety-nine per cent of the eggs and poultry meats are retailed and nearly half of the output is sold at the farm to auto trade.)

Poultrymen of the county are usually keeping cockerels in batteries until marketed as broilers. They keep the pullets in batteries from four to sixteen weeks. In general they keep the pullets in the batteries as long as they are doing well.

Many of the poultrymen are raising broilers in batteries during the majority of the year. These are generally retailed (dressed) to regular customers.

Ninety-five per cent of the laying birds are White Leghorns. The "extra" broilers are chiefly from purchased Barred Rock chicks. One man turns out 1,500 broilers weekly during the entire year and sells them wholesale to one New York commission man (delivered by truck, a 45-mile ride.)

Two-story laying houses are not uncommon in the county. Most of the poultrymen have supplemental incomes. They are chiefly from the sale of fruits, small fruits and vegetables. These are also retailed for the most part. In quite a few instances poultry is a side line on intensive garden farms or on dairy farms (without any pasture).

R. E. Harman, county agent.

THE annual Field Day of the New Jersey State College of Agriculture and Experiment Station will be held at New Brunswick on Wednesday, June 11. At that time the work and activities of the institution will be open for inspection by farmers, amateur gardeners, and homemakers.

The Curtain Rises at Eight

By W. R. GORDON

If you happen to be passing the community building some evening and hear a feminine voice, vibrant with emotion, shouting; "You come one step nearer and I'll shoot," don't summon the police or run home for your gun.

If you see your neighbor approaching, his car piled high with household goods, don't suspect the sheriff has him. If when you're prowling around home some rainy afternoon you miss that flowered dress and cut-a-way coat you used to wear on "dress-up" occasions, don't declare there have been thieves in the house.

These are "symptoms," just as sure as hand-shakin' in a political year. You must have missed seeing the bills in the post office and store, or reading the big news in the "weekly." Well you better hustle 'round and get your tickets to the big show for "the curtain rises at eight."

"All the world's a stage," at least the little world of scores of eager amateurs throughout the state these days. But it's a different one than the work-a-day world. This is a world of romance, of color, of beauty; a world of "make-believe" where hopes come true.

We might add: "And all of us are players." For when we witness the play we not only see it, we live it. We're acting too. The trials and triumphs of the hero or heroine, they are ours.

But acting is not only to be encountered at the play. We're acting a role when we relate a narrative; when we don regalia and perform the ritual of the lodge or even when we approach a business prospect. Perhaps this explains why we are such keen judges of other people's actions. Maybe this is why the theatre has endured for some thousands of years with comparatively little change. Civilized life has always seemed to foster this form of illusion.

Appreciative Audiences

Where will we find an enthusiastic audience as that made up of our own folks? Where a more genuine and sincere appreciation of our talents? Certainly a Barrymore or a Pickford could have no more. Isn't this a worthy community aim in itself, to have a community frankly express enthusiasm over its own giftedness?

In the past, country life has meant to many a serious struggle for physical and material achievement. Not to all, to be sure. But more and more today there is a growing suspicion that material achievement may in itself prove only a will-o'-the-wisp. It does not always satisfy. Fortunate indeed is the man or woman who has chosen a vocation in which he or she finds a genuine thrill in working at it every day. Most of us need other activities that afford chance for play of our imagination; for the chance to create. There is joy in creating. There is a joy in self-expression that comes to the actor himself. There is wholesome entertainment for the community that encourages this sort of thing.

From 20 years to 80 in 12 minutes. Class receiving instruction in make-up.

Amateur play-making in rural Pennsylvania is out of the "romper" stage. It is outgrowing the cheap melodrama and the conventional three acts of sentimental rot. This is not meant to say that there is a vogue for the "high-brow" play. People don't respond to what is "high-brow" or "low-brow," but to what is a mirrored reflection of life itself. There will be comedy—mild and subtle, gay and frivolous, boisterous clowning. There will be sentiment, of course. But chiefly the satisfying play will have warm, sympathetic, human appeal; a friendly appeal at the level of our own daily lives.

There will be humor, but so will the actor picture with equal understanding the frayed-edges of life; stirring drama and stark tragedy. In the program of these up-to-date amateurs we find bits of history recreated, costume plays brilliant with color, dramatized Bible stories, plays for children—fairy tale and fantasy—and equally impressive, plays of childhood acted by children. Some of these

Not corn-borer territory, but where the "dramatic bug" is active. Each of these counties has had special training in play production for its leaders.

plays that are being given appear in a list at the end of this article.

These amateurs take their art seriously. They want to know more about the technique of play production. Questions fall under the following general heads: How to appraise a play. How to select the cast. How to coach the players. How to stage it. How to costume it. How to organize play exchanges and contests.

Like veteran directors these "home-spun" coaches will slip around to the back of the auditorium while the play is in progress and will watch for the weak spots. These weak spots are invariably indicated by coughing in the audience, shuffling of feet, or general restlessness. In these scenes the play is not "getting-over." After the show the actors will be told about these weaknesses. Suggestions will be given for improvement.

To satisfy the demand for this information the writer has been conducting leaders' schools in counties of the state. Twenty-two counties have had this service. In some the work has been continued for several years.

This play acting has not been without some economic return. The organizations in one county raised \$1,600 in a year for a very worthy educational purpose. Many halls have been built, equipped or remodeled with the receipts from plays. But more and more, plays are being given for recreational value.

Children's plays, Fairy Tale and Fantasy

Who says these amateurs are not alive to the tendency in industry. They are establishing their own mergers. Several in a county will arrange through their representatives to have a winter lyceum of plays. A schedule is made out. Each organization prepares a play and then each play follows a circuit giving its performance in four to ten places in the county. One of our counties this winter had twenty-two communities enrolled in this play exchange plan.

Then again, with such widespread interest there's bound to be rivalry. It's kind of a novelty to turn out to root for the home team of play actors, but the enthusiasm is no less than that displayed at the basketball game, though a little less boisterous. Put yourself in the position of announcing the decision of the judges to a crowd of 700 of these rooters. Better do it tactfully, too.

Some Examples

One section comprising parts of two counties just completed their contest. Seventeen organizations were entered. The Pomona Grange provided \$200 for prizes. Ask any one up there if they ever invested \$200 more profitably. You might ask also if these plays in the finals were not as good as any Broadway successes.

This play contest has had a unique development in three counties of the state. There the plays have been presented at the county fair. Franklin, Centre and Cumberland counties have been carrying on such county-wide contests for from three to seven years. Mrs. J. R. Stear has the distinction for having started the county theater at fairs in Pennsylvania. As a Red Cross worker in Ohio, Mrs. Stear established such a demonstration at the Butler county (Ohio) Fair in 1921. In '23, then a resident of Pennsylvania, she organized a similar theater in Franklin county. It has been a big feature every year since.

According to Mrs. Stear, seven communities entered the first year, and in spite of the fact that a large tent failed to show up, and there were frequent showers to discourage open-air performances, the "show went on" to enthusiastic audiences. Last year there were twelve plays entered, and by this time the towns were taking part too. This made necessary two groups in the competition and two sets of prizes of \$25, \$15 and \$10. Each group is allowed \$25 by the Fair Board for production expense. Local furniture dealers are glad to rent furniture for the staging.

Centre county established its country theater at the Grange Fair in '24. An auditorium on the grounds was fitted up, an addition to the stage built and some equipment constructed. Plays are presented only in the evening, and instead of being one-act performances they are full evening entertainments. Therefore only five communities can be accommodated each year. Admission is the same as in Franklin county, 25 cents, and the approximate total attendance for the week about 3,000. The prizes are \$30, \$20, \$10 and \$5, and in addition each group is given half the box office receipts for their night. Their share will average about \$75.

Cumberland county began in '26 with entries from Granges and schools. They also have a building on the grounds available for this purpose. When the schools perform no admission is charged, but 15 and 25 cents is charged for the Grange plays. Both afternoon and evening performances are given, and there are packed houses for each. Indications are that others will adopt the idea in the near future.

The stage is set, costumes and make-up on. "Overture! Every one on stage and to your places." The curtain rises at eight. (Cont'd on page 23.)

A Thinking Job

By Fisher Ames

Copyright, 1929, by Copper-Harman-Slocum Company

coffee, which Rose accepted, he strolled back to join Mr. Welby.

"You were down to the south'ard last night, I believe," he said. "Were you near that fire? From the light in the sky it looked pretty extensive."

Welby gave rather a dry smile. "We were near enough to it to be in it, that's all," he replied. "It looked extensive to me. I can tell you." He hesitated a moment and added: "We—that is, Pouche—staged a little rescue act. The plural pronoun was a slip. It was Pouche's idea. He put it through and pulled me along. Frankly, a fire like that 'gets' me. He's a cool young fellow. A dependable fellow."

"That fits my memory of him," said Hakewill. "I was in a little fix with him myself, not so long ago, on a runaway steamboat. She got out of hand somehow—I'm not engineer enough to know the causes—took the bit in her teeth, and just after we took French leave of her, piled herself on a bar and blew up. I haven't forgotten how Pouche stuck to his post at the wheel. Dependable, yes. And there's something attractive about him."

"There is," said Welby. "I was saying to myself a moment ago it was a pity such good raw material should be wasted in a place like this."

He laughed. "One of the maxims of business is, know what you want, then go get it. I must tell you one of last night's incidents. Pouche certainly

The Cheerful Plowman

HE MADE ME FEEL SMALL

HE made me feel small when my pockets were slack, when my coat had big holes in the front and the back, when my bank account limped and its feet wouldn't track. He made me feel small when my cash was all in, when hoppers were thick and the barley was thin, when mice starved to death in my favorite bin! He made me feel small when I owed him a note and couldn't come through with the sum that I wrote, when I felt all at sea in a floundering boat.

He made me feel small when the heat and the hail beat down all my crops, as it were with a flail, when my chickens all died and my liver turned pale. He made me feel small when my family was ill, when I owed every firm in the village a bill, when the wolf howled beside my doorstep and still, he made me feel small when misfortune was mine, when winds spoke in sighs and in querulous whine, when clouds were so thick that the sun couldn't shine!

I made him feel big when I found him one day when his cash was all lost and his power gone away, when his face was all flushed and his hair was all gray. I made him feel big when I found him dead broke, disgruntled, disgraced by the weight of his yoke, an object of scorn to the mightier folk. I made him feel big when his earlier friends closed up their big homes on the sides and the ends, when he got not a smile from the fellow who lends.

I made him feel big when his bank went ker-smash and his fortunes went wild in the terrible crash, when he needed the price of a portion of hash. I made him feel big when I gave him my hand and helped him to rise and implored him to stand and win back a bit of his place in the land!

I made him feel big when I loaned him the jack to "set up" again and to start "coming back," to win back his home and move out of his shack. I made him feel big though he'd made me feel small. I heard his faint cry though he'd jeered at my call—say, that is the tenderest mentrity of all! J. E. T.

knew what he wanted, though goodness knows why he did, and he literally went through fire to get it." Welby proceeded to relate his story.

Hakewill's interest was marked the moment the word shell was mentioned. "I think I'll wait and see Pouche," he said. "That pretty Miss Nancy expects him back soon."

He got up and stood eyeing the framed section of beam over the mantelpiece. "As you say, it seems a pity such good material hasn't better ground to grow in," he remarked. Then he went out, walked to the land-against one of the posts.

He was still sitting there when Toots arrived in one of the sailing skiffs. Toots instantly recognized the lean, alert figure with its wisp of faded beard and extraordinarily searching eyes with the kindly wrinkles at the corners. Now that he knew how big a man, professionally, Hakewill was, he felt a little shy, but the collector's friendly manner soon put him at ease.

"If you are not in a hurry sit down and tell me all about things," he said. "Well swap experiences since that day on the Blue Heron. I've given up that idea, by the way. It was not so practical as I first thought."

It wasn't easy to make Toots talk about himself, but Hakewill could inspire confidences because one felt the sympathetic, genuine nature behind the rather odd exterior, and because he gave as well as asked. One thing Toots held back, his interest in shell collecting. It seemed ridiculous to speak of his crude efforts to such a listener. It was Hakewill who brought up the subject.

"Tell me," he asked, "why you went back to the Sutter's. Mr. Welby said it was for a shell—but why?"

"It was a calliostoma I'd never found."

"That you'd never found. Then you know them? You've found others?"

"A few, sir. I pick 'em up sometimes—when I can."

"Why?"

"Well, I don't know. I like to. It's more exciting than shooting. They make me think." Toots reddened under his tan, at the admission.

"Have you kept some of these shells?" asked Hakewill. "I'd like to see them. Conchology is my very especial hobby, you know. Come on, let's go back to the Bullseye and look at them now." He declined to be put off and Toots, half embarrassed, half pleased, had to give in.

Hakewill sat down in front of the "collection" with an expression of surprise. He had expected the usual amateurish jumble of familiar specimens, but here was a really large layout, neatly tagged and arranged according to species and forms, with the date and locality under each shell. There were no very extraordinary "finds," but some were locally rare, and several "left-mouthed" shells attested to Toots' keen eye for variations. Hakewill was really deeply interested as well as surprised. He asked a number of questions. After awhile he went down stairs where Rose was waiting for him. "That young fellow has the true urge," he said. "It's astonishing what he's done, with only an elementary manual to guide him."

"He never could keep away from books," complained Rose. "He's doin' well here, but he ain't satisfied. He's hankerin' after an education—always was. It's the weak spot in him."

"Brains, Rose," said Hakewill. "He can't help the craving. It is instinctive in young fellows like him and it's a social crime they can't all have their chance. By jove, he shall have his, though, if he really wants it."

"Meanin' you're goin' to take him away from the Bullseye just when it's beginnin' to coin good money?" asked Rose almost aghast.

"Would you care to live your life here if you were young, even if you were paid for it?" retorted Hakewill. "Toots shan't have to at any rate. I've wanted an assistant for some time and if I ever saw the makings of a good one I see it in young Pouche. I'm not wholly selfish about it, but I can give him something besides a salary—an education—a specialist's training. If he sticks—and I believe he will—the time will come when any big museum will be glad to bid for him."

Hakewill was no believer in delay. With characteristic promptness he called Toots aside and made his offer. "If you're not sure you can't give your whole self to this permanently, drop any thought of it right now," he added. "It will mean hard work, in the field and at your books, and it will be a long time before you can qualify for anything bigger than my assistant. The Bullseye meanwhile may make a good deal of money."

(Concluded on page 25.)

2040 HOURS of actual washing in 35 weeks

THIS is the record-breaking pace set by a Speed Queen Aluminum Washer owned by a Hand Laundry in Butler, Pa. (name on request). It ran from 8 to 16 hours a day, 6 days a week, for 35 weeks—a total of 2040 hours—and is still going just like new. This is equivalent to 40 years of service in the average home.

Only a washer with such fine materials and workmanship as used in the Speed Queen could withstand the constant strain of one heavy batch of clothes after another for so long a time.

This unusual record offers concrete evidence as to why the Speed Queen carries one of the strongest guarantees in the washing machine industry.

Although the Speed Queen sells for \$50 less—it offers you every advantage of washing efficiency, colorful beauty and guaranteed durability found in the highest priced machines. By all means—before you buy a new washer—mail the coupon below.

For homes having electricity, the SPEED QUEEN is available with a high grade electric motor.

The Shrine of Civilization

THIS morning a young friend of mine—a bridegroom of four weeks time, came into my kitchen and sat in my old-fashioned kitchen rocker as I made a couple of pies and prepared other foods to be consumed by the family during the day.

Our talk was mostly of books, for he is a student as well as a teacher of English. Now and then, however, we chatted of real experiences this young couple is having at real life.

The lad followed me into the pantry when I placed the pies on a shelf to cool.

"Oh," he said, "those pies do look good. We haven't yet gotten organized so the wife can bake pies and things, but I guess we will soon."

And then he went on to tell me how they used to do at home. He said, "Mother always had pie or cake or cookies and fruit handy."

I do hope the dear young bride of a month will hurry and learn to make pies. Homes and civilization are safe so long as our brides and bridegrooms enjoy kitchens and the delicacies in the pantry.

I regret the modern tendency toward tiny kitchens. They may be compact and save time—but what are women as a class doing with the time they save? Is it used toward making better homes? The kitchen should of course be large enough for the family to gather around and lend a helping hand.

Kitchen Confidences

One of our favorite stunts was to do all the dishes, including clearing of the table and putting away every dish, without any one taking a step. Fun—why that was more fun than the sophisticated youngsters of today have at their high-priced hotel dinner parties.

A kitchen rocker, chintz covered, invites confidences. It is always easier to tell mother things while kitchen activities are in progress.

I love experimenting with all the new household contrivances. I have a steam pressure cooker, waterless cooker and an electric cooker that will cook an entire meal (including a steamed pudding) in the one utensil, with but one switch—and so on through the list of newer kitchen utensils.

The modern methods of cooking have eliminated drudgery from the vocabulary of the housewife. We who keep house today have leisure that our grandmothers could not have conceived.

How pretty dishes are today. The colored glassware gives charm and gaiety to any luncheon or dinner table. I had not seen any colored glass in yellow until the other day. I quite held my breath, when I spied the charm of a friend's dinner table. Possibly the shade was nearer amber than yellow—but I want some like it.

Mother Reigns Here

And how cool looking is the green glassware! A well cooked dinner, nicely served, is as much a work of art as any painting—and much more satisfying to many at least.

Of course a kitchen should be immaculate. It should fairly shine with cleanliness. Don't you have a feeling your whole house is clean when your kitchen is clean and in order?

A piece of copper on a window sill, which will catch and reflect the sun's rays, rests one's eyes when entering the kitchen. Color, riotous color, our kitchens must have.

But how dead a place even the most gorgeous kitchen would be without Mother. It is in her home, yea in the heart of her home the kitchen. Woman is at her best. The woman at home, cooking and baking for her family does not have time to develop complexes.

Ah, let me go into the house of the stranger through the kitchen and I will pretty well characterize the home for you. It is the kitchen that

gives atmosphere and character to a house and makes of it a home.

Our country is safe so long as the kitchen remains The Shrine of Our Civilization. May H. Mumaw.

Our Children's Feet

IN buying hose for children see that they are large enough, but not so large that they wrinkle across the ball of the foot or over the toes. A short stocking may bend the toes out of their proper position and a wrinkled one often causes a blister. The careless darning of hose at heel or toe is also inadvisable, and if a heel must be mended, use a soft cotton yarn and a fine crochet hook and crochet a new heel or as much as may be necessary, working from the edge of the hole to the opposite edge and fastening carefully along the sides.

In buying children's shoes be careful to get them long enough. A little lad was taken to a famous specialist. He was thought to be suffering from what was called the dreaded hip joint disease. Fortunately the specialist was versed in small things as well as serious ills, and he told the mother to go home and buy the child longer shoes, changing for a new pair at least every three weeks. The fact that his toe pressed against the end of the shoe had caused him to favor that foot, throwing it out exactly as is done when there is a hip disease. Three months of careful shoe fitting brought about a complete cure.

When children wear wool hose or Boy Scout hose, or adults wear wool for hiking, hunting, fishing, etc., care should be taken in washing them. Wash in warm suds, rinse in water of the same temperature. Squeeze dry but do not wring. Then pull them over shoe trees, or lasts, to dry. These should be of the same size as the foot and hose dried in this way will never shrink nor become uncomfortable.

Wool hose and all colored hose should always be dried in the shade.

Foot odors are unpleasant, and yet there are few families without at least one sufferer. Usually the nervous child has feet that perspire excessively, and even a daily changing of hose seems only a partial preventive of odors. Wash the hose daily and dust the inside with powdered borax when dressing. Every morning just before putting on the shoes sit a little borax into them and if the feet perspire excessively, use a little when the shoes are taken off as well.

Keep Your Napkins White

NAPKINVELOPES are a positive necessity. The ones we are offering are bound with yellow calico-print bias fold and have birdies of the same on the outer flap. The material itself is a cretonne weight in horizon blue. Blue covering helps to keep white linens from turning yellow. These napkinvelopes come to you cut out, with bias binding, applique bird or birds, embroidery floss and instructions included.

Number 225 is the single bird for the tea napkins. No. 226 the sociable two birds for dinner size perhaps, al-

Children very often come in with wet shoes, and the smallest child should be taught the necessity of putting wet shoes off the feet as soon as possible. Do not put the shoes on a hot fire, but fill with hot oats or let stand in a moderately warm room or on a shaded side porch. This will keep the shoes from shrinking, usually from hardening, although some cases it may be necessary rub in a little fat, if the leather has been thoroughly soaked.

L. M. Thornton

Resting Rugs

THE other day I saw a rug on the edges and some spots as good as new, but the rest in it had been worn constantly in some places and not in others. The mistress of the house remarked that the family was "hard on floor covering" and also that the floor beneath was rough and uneven, so it was no wonder things looked so shabby. She mentioned that she was not able now buy a new one and the old one was hard to do.

All that could have been avoided a little care. Some housewives rest their rugs, just as they rest their shoes. Two pairs of shoes worn alternately will outwear two pairs bought in succession and worn constantly, as many people know, and the habit of using one part of the rug this month and another next month will do wonders toward making the last longer.

By changing the furniture about and turning the rug end for end, extra wear can be obtained. If the table stands in the middle of the living room a month shift it to one side later. If a worn spot appears on the furnishings so that people do not walk over that spot constantly, extra small rugs brought in on rainy days will save much wear and often it is good policy to take the good rug up for December, January, February and March and substitute an older one saved for this purpose.

If the floor is rough take a pad and smooth off the high spots or cover evenly with a padding of newspaper as we used to do with the rag carpets. The floors will be warmer and the wear and tear less. Every few months new newspapers can be used and the dust disposed of.

By the doors little rugs that make as nearly as possible the rug rug can be used part of the time or all the time. The aim is to make the wear evenly all over and look as long as it lasts.

Experiments in Sub-Irrigation

WHILE experimenting with paper mulch and with dry earth mulches during the season of 1929 I had an experience that may interest those who are not wholly dependent on rain fall to supply water to the garden crops.

For the purpose of testing the relative values of paper mulches and dry earth mulches, six rows of sweet corn, each 24 feet long, were planted early in July, merely for the purpose of this test, and not with any expectation of maturing a crop so late in our short season. The rows were laid out across a gentle slope. Adjoining on the high side were two rows of late garden peas. The low side of this sloping plot adjoins the lawn surrounding the residence. Mulching paper was placed between the rows in the east half of each row in this plot and a dry earth mulch was maintained over the west half of each row by shallow cultivation after each shower that wet through the dry top soil.

No rain fell on this plot during the last week of July and the month of August. When the mulching paper was spread for this test the top two inches of the soil was already dry, so the east half was unintentionally double mulched. Nor had I any intention of supplying water artificially by spraying with a hose, as that would defeat the object of the test. The lawn was not watered and all except that part accidentally watered by sub-irrigation seemed to be dead.

Lawn Turns Green

The two rows of garden peas were watered three times each week with a hose during the drought period. The peas were mulched with sweet clover hay. The writer thought he was using just enough water to keep the pea vines green, and was surprised after a week's watering of the peas to find that a strip of the lawn, ten feet wide alongside the corn rows, was turning green and owing to its rank growth had to be trimmed with lawn mower every week during August.

The surplus water applied to the peas seeped fifteen feet across the corn plot between the surface and the subsoil and ten feet across and under the lawn sod. It was a demonstration of sub-irrigation.

After noticing that the ten-foot strip of lawn was turning green I quickly recognized the signs of a subterranean movement, because I have practiced sub-irrigation in other parts of the same garden where topography was more favorable. I dug a trench 40 feet long 12 inches deep with fall of two inches for the entire distance and laid two-inch farm tile the entire length with an elbow at the high end to receive the nozzle of the hose.

After an Inch of Rain

This system of sub-irrigation cannot be put in operation until after an inch or more of rain has fallen and spread itself over all the exposed surfaces of the soil grains. Then surface tension will pull all the water that is dribbled into the tile in a small stream and spread it over an area extending fifteen feet down the slope and six feet up the slope, or a total area of 21x40 feet. The day following a goodly shower the dribbling stream may be turned in and will soon be leaking from each one of the 40 joints between the tiles to be carried in all directions by surface tension. It should be kept running all day if the weather is warm and the air dry.

After experimenting for ten years in my own garden with sub-irrigation it is my judgment that supplementing the seasonal rainfall with a trickling stream fed through farm tile combined with mulching assures an economic and successful method of using extra water in the production of garden crops. It also tides the gardener over the dry periods.

McKean county, Pa.

How New Jersey "Chief Spud" title was won

ALL records for the event were shattered when Bennett & Thomas, Belvidere, turned in a 496 bushel average acre yield to win the New Jersey Potato Growing Contest of 1928—and the title of "Chief Spud."

"Last year we joined the 300 Bushel Potato Club of New Jersey," write Bennett & Thomas. "We planted about 20 bushels of seed per acre in rows 34 inches apart; the seed being placed 11 inches apart in the rows. "We used 1000 pounds of Swift's Red Steer 0-16-0 Acid Phosphate (Superphosphate) broadcast, and 1200 pounds Red Steer Fertilizer 4-8-7 was used in the rows when planting.

"We have used Swift's Red Steer Fertilizers for the past 5 years and have always received them in good mechanical and drilling condition. Their slogan, 'It pays to use them,' is surely true."

Successful farmers the country over are coming to appreciate the importance of quality in fertilizer. Many are turning to Red Steer. For Red Steer carries with it an assurance of quality. In addition to the usual "guaranteed analysis" tag, you will find attached to every bag of Red Steer a Certificate of Quality. This assures: BEST MATERIALS—plant food from the most productive sources.

DOUBLE MIXED—fertilizer thoroughly and evenly mixed and in good drilling condition, so that each plant will get its share of plant food.

TRIPLE TESTED—in fully

Theo. K. Bennett, of Bennett & Thomas, Belvidere, N. J.

equipped laboratories, assuring the right plant food in the right form and amount.

For new profits in 1930, ask your Authorized Swift Agent about Red Steer 7-11-7; 3-12-15 and 4-16-10—the money-saving high analyses.

Here's the FOOD Your Corn Crop LIKES

It is just another corn crop for you this year, or have you decided to join the ranks of farmers who make a crop that really is a crop? Now is the time to decide... and you can just as easily make a good crop. No luck to it... just one single rule for success.

Chilean Nitrate of Soda is the difference between a good corn crop and a poor one. A side dressing with this nitrate fertilizer (the only natural nitrate in the world) greatly increases the yield. Hastens maturity. Makes larger ears with more corn per ear and more ears per stalk.

Chilean Nitrate is not synthetic. It is mined and refined in Chile, largely by American capital, brought here in American ships and sold to American farmers at a low price. Its small cost is returned to you many times over in increased crop profits.

Free Fertilizer Book

Our new book "How to Fertilize Corn in the North" tells how to make a real corn crop. It is free. Ask for Book No. 6, or tear out this ad and mail it with your name and address written in the margin.

What Our Readers Say

Women Drivers

I HAVE just read the article written by S. W. about women driving cars. I certainly do not agree with him on any of his statements. I have two daughters who drive cars and there are many more girls and women in our community who drive cars, and I would much rather meet any one of them on the road than a lot of men driving (half or entirely shot) with bad booze, or some of the young smarties trying to show off or racing.

As to them waiting for a man to change a tire, I am sure that either of my girls will change a tire just as soon as S. W. will. They can also cook and bake or do anything else that a good robust country girl can do.

In our community I have never known a girl to run over any one, but quite a few have been run over by men, and as to the cops passing them by, I will give an instance that happened a few weeks ago near my house, where a "Stop" sign stands at a road entering on the Easton and Philadelphia Highway. A cop happened to be watching. Along came four machines, three men and one woman driving them. He pulled them all in, men and woman. The woman paid her fine the same as the men.

I think that women drivers are just as safe to meet on the road as the men and oftentimes much safer. I have been a reader of your fine paper a long time and count it one of the best farm papers of the day.

Chas. C. Melchor.
Bucks county, Pa.

Champion Rodent Catcher

IN Pennsylvania Farmer of March 8th appeared a small article about Mr. Frank Auchbach of Lebanon county, Pa., the 1929 champion rat and mouse catcher. A number of inquiries have been received by Mr. Auchbach from persons whose premises are overrun by the small pests, and by the permission of Pennsylvania Farmer the writer of the article will try to impart the main methods used by the successful champion.

Mr. Auchbach says: "To catch mice, I use the small, inexpensive mouse traps. Both the single snap traps are used and the circular four-hole trap which will catch four mice at one setting. Choice bits of meat and cheese, etc., are used as bait. It is a change for the mice's diet of whole grain, chop and other ground feed. The traps are set in the granary and chop chests and mash containers mostly.

"The rat story is very different. These ugly animals are mostly too wise to be caught in baited rat traps and their use was chiefly unsuccessful. A dozen and a half small steel traps were bought. These are the small size traps which are used to catch small fur animals, such as skunks. Anybody can catch as many rats as I did if they use perseverance. Sometimes it requires half a dozen traps to catch a single rat, set and arranged differently, nightly, for a week or until the cunning fellow makes one false step—plump into a concealed trap.

"At our place the floors are concrete mostly and the rats break into the granary, corn cribs and chop boxes. There are holes outside the corn shed and about the barn and chicken houses. These are the places where I made my record. Outside I set the traps about the holes, cover them with chaff and tie them fast. Inside I do not tie the traps because the openings are too small for a rat to drag a trap away. Outside I cover the traps with boxes so that the cats will not be caught. Two or three were caught in traps lately in spite of these precautions. Fine hay is used to hide

For Distinguished Service

AN annual award of a gold medal and five thousand dollars in cash is announced by Senator Arthur Capper "to provide a concrete expression of gratitude to some of the people who make contributions of national importance to American agriculture and to assist in stimulating public appreciation of unusually fine service to our basic industry."

Any living American who has rendered distinguished service to agriculture of this country is eligible for consideration. No time limit is imposed as to when the service was performed. The first award will be presented next December. Communications concerning this award should be addressed to F. R. Nichols, secretary of the Committee of Awards, Capper Building, Topeka, Kansas.

the traps too, but it is apt to set down rather solid while chaff will not. "I make the rounds of my traps often as late as midnight and find again the first thing in the morning. The rats that are in the traps are killed and need not suffer unnecessarily long. Some nights are successful ones, five or six rats being trapped. Then, again, several nights bring empty traps only. Very often, too, traps are sprung but the rats get away. Sometimes parts of the fur show how narrow a square it was for some robber rat.

"These then are the main facts of my success. Most persons give up after one or two failures. The longer a rat in a hole doing nightly damage escapes my traps the more determined I get. Often it is a battle of wits, but if I wait long enough and use enough traps and arrange them a dozen ways or more I know that I will win at last."

Robert I. Weigley.
Lebanon county, Pa.

A Tramp's Industry

TIMES agriculturally were very good about 1890. Industry in its modern sense had not been born. Tramps were frequent. They dropped off the railroad for a bite to eat every now and then—weekly would be staying the case altogether two months once four came in one day. Mostly they were a dead level of sloping fellows, but one morning an exception turned up. He came before breakfast and while waiting for his cats he went to the barn and looked up the tools to clean the stable.

Dad's stable was not much of a paradise. Occasionally a restless critter would fire a lusty foot across the narrow passage and convert the sliding cover of a "dung hole" into kindling. That was a spring morning and probably the enclosures were in just that condition. The writer was only a kid then, the size to stand around and take notice. This tramp wore an old corduroy reefer—I can see him yet. When the manure had been forked out and the floor scraped with a shovel the tramp found an old discarded broom somewhere; he found it for surely no broom was ever kept in the barn.

With this old crippled broom he swept the stable clean. I don't know that the old stable was ever swept again, but these days when I sweep my own stable with a first-class broom I hail the tramp. In the spring birds of passage sing to us for a day and fly on, but we remember their notes—that's the way it was with the tramp, "gone but not forgotten."

H. D.

Judge by Results Alone

Three ears—all look alike. But note the difference. Seed from ear No. 1 would produce a poor crop; No. 2 a fair crop; No. 3 a prize-winning crop. U. S. Department of Agriculture Bulletin 414 says: "Seed selected from the high yielding rows of a breeding plot produced 18 bushels more per acre than equally fine-looking seed from a general field of the same corn."

Write us for U. S. Department of Agriculture information on seed corn. Address: FIRESTONE TIRE AND RUBBER COMPANY, Akron, Ohio
Los Angeles, California; or Hamilton, Ontario

Tires may look alike, even as seed corn - But what a difference!

JUST as you carefully select and test seed corn to get the greatest yield, so Firestone selects and tests rubber and cotton to give you the greatest yield of mileage and safety.

From Singapore and the great Firestone Rubber Plantations in Liberia, the best grades of rubber are selected at savings which are passed on to you in tires of extra quality, at prices no higher than ordinary tires.

From plantations in various parts of the world, Firestone selects the choicest, strongest, long staple cotton. In Firestone's own cotton mills—largest in the world—this cotton is tested and scientifically twisted into cords of maximum elasticity and, in addition, Gum-Dipped, which saturates every fiber of every cord with rubber. This extra process minimizes friction (greatest enemy of tire life), and adds thousands of miles of extra service.

Like seed corn, tires may look alike until you know the difference. Let the Firestone Dealer show you why Firestone Gum-Dipped Tires hold all world records for Safety, Endurance and Mileage. Then, Judge By Results Alone!

THE FIRESTONE TIRE & RUBBER COMPANY

Here's the FOOD Your Corn Crop LIKES

IS it just another corn crop for you this year, or have you decided to join the ranks of farmers who make a crop that really is a crop? Now is the time to decide... and you can just as easily make a good crop. No luck to it... just one single rule for success.

Chilean Nitrate of Soda is the difference between a good corn crop and a poor one. A side dressing with this nitrate fertilizer (the only natural nitrate in the world) greatly increases the yield. Hastens maturity. Makes larger ears with more corn per ear and more ears per stalk.

Chilean Nitrate is not synthetic. It is mined and refined in Chile, largely by American capital, brought here in American ships and sold to American farmers at a low price. Its small cost is returned to you many times over in increased crop profits.

Free Fertilizer Book

Our new book "How to Fertilize Corn in the North" tells how to make a real corn crop. It is free. Ask for Book No. 6, or tear out this ad and mail it with your name and address written in the margin.

What Our Readers Say

Women Drivers

I HAVE just read the article written by S. W. about women driving cars. I certainly do not agree with him on any of his statements. I have two daughters who drive cars and there are many more girls and women in our community who drive cars, and I would much rather meet any one of them on the road than a lot of men driving (half or entirely shot) with bad booze, or some of the young smarties trying to show off or racing.

As to them waiting for a man to change a tire, I am sure that either of my girls will change a tire just as soon as S. W. will. They can also cook and bake or do anything else that a good robust country girl can do.

In our community I have never known a girl to run over any one, but quite a few have been run over by men, and as to the cops passing them by, I will give an instance that happened a few weeks ago near my house, where a "Stop" sign stands at a road entering on the Easton and Philadelphia Highway. A cop happened to be watching. Along came four machines, three men and one woman driving them. He pulled them all in, men and woman. The woman paid her fine the same as the men.

I think that women drivers are just as safe to meet on the road as the men and oftentimes much safer. I have been a reader of your fine paper a long time and count it one of the best farm papers of the day.

Chas. C. Melchor,
Bucks county, Pa.

Champion Rodent Catcher

IN Pennsylvania Farmer of March 5th appeared a small article about Mr. Frank Auchenbach of Lebanon county, Pa., the 1929 champion rat and mouse catcher. A number of inquiries have been received by Mr. Auchenbach from persons whose premises are overrun by the small pests, and by the permission of Pennsylvania Farmer the writer of the article will try to impart the main methods used by the successful champion.

Mr. Auchenbach says: "To catch mice, I use the small, inexpensive mouse traps. Both the single snap traps are used and the circular four-hole trap which will catch four mice at one setting. Choice bits of meat and cheese etc. are used as bait. It is a change for the mice's diet of whole grain, chop and other ground food. The traps are set in the granary and chop chest and much on runners mostly.

"The rat story is very different. These ugly animals are mostly too wise to be caught in baited rat traps and their use was chiefly unsuccessful. A dozen and a half small steel traps were bought. These are the small size traps which are used to catch small fur animals, such as skunks. Anybody can catch as many rats as I did if they use perseverance. Sometimes it requires half a dozen traps to catch a single rat, set and arranged differently, nightly. For a week or until the cunning fellow makes one false step, plump into a concealed trap.

"At our place the floors are concrete mostly and the rats break into the granary, corn cribs and chop boxes. There are holes outside the corn shed and about the barn and chicken houses. These are the places where I made my record. Outside I set the traps about the holes, cover them with chaff and tie them fast. Inside I do not tie the traps because the openings are too small for a rat to drag a trap away. Outside I cover the traps with boxes so that the rats will not be caught. Two or three were caught in traps lately in spite of these precautions. Fine hay is used to hide

For Distinguished Service

AN annual award of a gold medal and five thousand dollars in cash is announced by Senator Arthur Capper "to provide a concrete expression of gratitude to some of the people who make contributions of national importance to American agriculture and to assist in stimulating public appreciation of unusually fine service to our basic industry."

Any living American who has rendered distinguished service to agriculture of this country is eligible for consideration. No time limit is imposed as to when the service was performed. The first award will be presented next December. Communications concerning this award should be addressed to F. E. Nichols, secretary of the Committee of Awards, Capper Building, Topeka, Kansas.

the traps too, but it is apt to set down rather solid while chaff will not. "I make the rounds of my traps often as late as midnight and the again the first thing in the morning. The rats that are in the traps are killed and need not suffer unnecessarily long. Some nights are very successful ones, five or six rats being trapped. Then, again, several nights bring empty traps only. Very often, too, traps are sprung but the rat get away. Sometimes parts of the rat and fur show how narrow a squeak it was for some robber rat.

"These then are the main facts of my success. Most persons give up after one or two failures. The longer a rat in a hole doing nightly damage escapes my traps the more determined I get. Often it is a long battle of wits, but if I wait long enough and use enough traps and arrange them a dozen ways or more I know that I will win at last."

Robert I. Wagley,
Lebanon county, Pa.

A FAMOUS NAME . . . A FINER CAR

A finer car
for those who buy with care

NEW SERIES

PONTIAC BIG SIX

Illustrated above: The 4-Door Sedan, Body by Fisher

Some people are more careful than others when they spend their money. They don't buy until they see full value for every dollar. Perhaps you are like that.

If so, it is quite possible that there is a Pontiac on your farm right now. Cars bearing this famous name have always been popular with those who insist upon exceptional motor car value.

But you will find added reasons for this popularity when you see the latest Pontiac—the New Series Pontiac Big Six. This finer car is all that its predecessors were, and a great deal more besides.

Its powerful engine, yielding 60-horsepower at 3000 r.p.m., is much smoother than before. For not only does it have the Harmonic Balancer which eliminates torsional vibration, and the G-M-R cylinder head which removes spark-knock and roughness—but the engine now has a stiffer crankcase and rests upon new-type rubber supports which

completely insulate it from the frame. A new steering mechanism which acts upon roller bearings makes the New Series Six easier to handle. Its big, non-squeak, enclosed, four-wheel brakes have been made even more positive in their action. New-type Lovejoy hydraulic Shock Absorbers, at no extra cost, give added riding ease. A sloping non-glare windshield—a Fisher body feature—increases comfort and safety by deflecting the glare of approaching headlights.

And with all these finer features goes the same solid economy which Pontiac owners have always enjoyed and which releases so many dollars for the other things farm families need.

See this New Series Pontiac Big Six at the showroom of your local Oakland-Pontiac dealer. Let him take you for a trial drive in this finer car bearing a famous name. . . . Seven body types, f. o. b. Pontiac, Mich., plus delivery charges. Oakland Motor

Write for an interesting booklet which illustrates and describes the design of the New Series Pontiac Big Six with its important improvements.

\$745

Remember . . . you can buy a Pontiac on special G. M. A. C. terms offered to farm buyers exclusively with payments at convenient intervals during the year.

PRODUCT OF GENERAL MOTORS

AND UP, F. O. B. PONTIAC, MICH.

This CHART Shows the Wonderful Growth of INTERNATIONAL POPULARITY

BACK in 1919 International trucks were already very popular. On the farms and in the cities, many thousands of men were saving their time and money by hauling their loads in trucks made by International Harvester. In that year Internationals were already in the front rank of production.

Yet that was only a start. See what has happened since 1919. Although the manufacture of all trucks has only DOUBLED in the ten-year period, the manufacture of Internationals has multiplied SEVEN FOR ONE. The lines on the chart above show clearly how the need for low-cost hauling has brought people to the International Harvester product.

There can be no better recommendation than this, for the proof of the pudding is in the eating. The proof of complete hauling satisfaction is in the hands of the truck owner. Today you can see the proof of International success everywhere on the roads.

On such evidence, do your own hauling by International. Choose your truck from this line: the Six-Speed Special shown and described here; the Speed Trucks, 1¼, 1½, 2, and 3-ton; and the Heavy-Duty Internationals, 2½, 3½, and 5-ton. A Company-owned branch nearby, or a dealer still nearer, will deliver the International truck you choose, and see that it gives you many years of faithful, economical service.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. OF AMERICA Chicago, Illinois
(Incorporated)

International 1½-ton Speed Truck

The Six-Speed Special

The scene at the top of the page shows the popular Six-Speed Special—a truck which is fast on the hard road and powerful in deep mud. Have you seen a demonstration of this sturdy International? It is the original heavy-duty Speed Truck with six forward speeds. Through its 2-speed axle it combines high road speed with tremendous pulling power for gumbo, steep hills, and soft fields. It has sturdy members throughout, good looks, and 4-wheel brakes. The Six-Speed Special is the great favorite for rural hauling. Capacity loads always come through, so long as the wheels can reach the road bottom, when the Six-Speed Special is on the job. Catalog will be sent on request.

INTERNATIONAL TRUCKS

Who ever thinks of asking,
"Did you buy your Buick new?"

Surely, your friends would never think of asking this question . . . nor does anyone ever ask any Buick owner—"Did you buy your Buick new?"

Most unconcerned of all, as to whether it's "new" or "used," is a Buick itself. It performs in the same smooth, reliable Buick way whether it has traveled fifty miles or fifty thousand *plus*.

Why wait, then, to own the Buick you have long wanted? Why deprive yourself any longer of the joys of this car—a car so good that from two to five times as many people buy Buicks as any other car of its price.

Thousands are buying used Buicks, from \$500 up, as a preferred type of transportation.

The purchase of a Buick at resale prices will bring you the same extra value and the same superior motoring satisfaction which have built this tremendous Buick popularity.

You will enjoy Buick power—Buick swiftness—Buick roadability and riding comfort—all of which is to say you will enjoy motoring qualities absolutely unmatched in any new car of comparable price.

Buy your Buick now, when prices are lowest. And buy it from a Buick Dealer. He has a thorough knowledge of Buick construction. He conditions his Buicks carefully and prices them fairly. His establishment is the place in your community to buy a used car.

A CORN-STALK SHAVER TO CONFOUND THE CORN BORER

Old corn stalks and other refuse must be either plowed completely under or removed from the field before the middle of May to keep the corn borer under control. If for some reason plowing is not desirable the most effective method of handling the stalks seems to be to cut them off at the ground surface, rake them up clean and burn, says the U. S. Department of Agriculture.

A stalk shaver for detaching the stalks has been developed recently, and is described in Miscellaneous Publication 69-M. The use of the shaver makes the subsequent raking operation easier. The shaver knives not only cut the stalks free but cut through the ridged rows and tend to level the soil surface, thus lightening the work of the rake. The cleanest raking can be accomplished with the least strain on the rakes if the soil has been rigid as little as possible during the cultivations of the corn.

U.S. Wiltshires on British Market

AFTER several years of experiment the U. S. Department of Agriculture has succeeded in producing, from American hogs, Wiltshire sides satisfactory to the discriminating English bacon trade. The hogs were produced on the Department's range livestock experiment station at Miles City, Mont.; were fattened by the American free-choice system of self-feeding on a ration of ground barley, tankage and mineral-mixture of alfalfa pasture; were slaughtered and cured in a packing plant at Milwaukee, Wis., and were shipped to the London market.

The British consignees accommodated the American shippers by rendering separate reports on each of the dozen bales of sides, so that the British market opinion as to appearance, size and quality of the bacon as well as the cure, might be used to complete the Department's experimental data. The official British report commented on the desirable length and leanness of this bacon and rated it "quite equal to the best brands of Canadian bacon."

F. Z. Russell, senior animal husbandman of the Department's Bureau of Animal Industry, states that hogs of the so-called American lard type proved the equal of the bacon type hog in this experiment. Four lots of hogs were included in the experiment, namely, Chester Whites, Yorkshires, a cross of Chester-White boars with Yorkshire sows, and a cross of York-hire boars with Chester-White sows. Crosses of the two breeds proved no better than the breeds themselves.

- The Woodpile (Mix), 1 act, 2 males, 1 female.
- Ten Minutes by the Clock (Riley), 1 act, 6 males, 2 females.

HOGS MARKETED BY TRUCK
MORE than 60 per cent of the hog receipts at the Indianapolis market came in by trucks," says Prof. J. R. Wiley of Purdue University. He continues: "Trucking into the Indianapolis market promises to increase until it is practically a trucking market."

"Trucking has proved more economical than shipping by rail for short hauls of less than 30 or 35 miles. Around 90 to 100 miles, the rates by rail become cheaper than those by truck. When the haul is more than 100 miles, it is up to the discretion of the shipper."

Prof. Wiley has spent more than five years making a special study of livestock shipping problems.

HARDWOOD ASHES

GARDENERS frequently ask if coal and wood ashes make good fertilizer for garden soils. According to the United States Department of Agriculture, wood ashes from hardwoods contain considerable potash and a little lime, and are a valuable fertilizer. Fairly dry unleached hardwood ashes may be applied at the rate of not more than 50 pounds to 1,800 square feet. Wood ashes from softwoods, and hardwood ashes that have been exposed to the weather and have had the potash leached from them, have little fertilizer value. Coal ashes have little value as fertilizer, their use being mainly to loosen the soil and make it more workable. On heavy clay soils, coal ashes tend to lighten the soil.

be sure to see the 1930 NEW IDEA

the ONLY Spreader with
the Automatic Feed Safety

IT is characteristic that NEW IDEA should invent and perfect the trouble-preventing Automatic Feed Safety, just as it has led the way in so many other spreader improvements. This new device, found only on the 1930 NEW IDEA, automatically shuts off the feed when you stop the beaters. It prevents accidental crowding of the load into the cylinders, with consequent annoyance, delays and breakage.

The Lime Spreading Attachment

Turns any Model 8 NEW IDEA into a perfect one-man Lime Spreader. No shoveling back of load, no dirty labor. Controlled feeds, 1/2 to 5 tons per acre. Large capacity. Attached in 30 minutes.

What farmer would hesitate to enjoy this Wheeling quality when he will save money in the end and get extra years of trouble-free service?

The Story of Woodbine Farm

By W. D. ZINN

CHAPTER XI

SOMETIME in the nineties a few farmers in my community decided they wanted to organize a farmers' club. A meeting was called at the Court House on a certain Saturday afternoon. Eighteen farmers met. An organization was effected and the author was made president of the club. Similar organizations had been formed in the past, but they were of short duration.

One of the farmers present said, "Whether this organization succeeds or fails depends upon the eighteen men who are present here this afternoon. I am one who is ready to pledge my word and honor to stick by this organization." The others agreed to do likewise. For eight years that organization met regularly. Gradually this little band of farmers increased in numbers. We finally reached a point when we wanted every farmer to know what we were doing.

We felt that in order to increase our usefulness we must give greater publicity to our work. To help along with this the editor of one of our county papers, who had been a frequent visitor at our meetings, offered a column or more of his paper for our use. This would require a correspondent. By unanimous vote the author was elected editor of the agricultural department of the Barbour Democrat. Of course there could be no compensation for this labor, and I have often thought what a mistake I would have made had I said when elected to this position, "I can't do all this work without being paid for it." I now look back upon this moment as being the turning point of my life.

On Board of Agriculture

When Gov. White appointed me a member of the State Board of Agriculture, he said to me, "Mr. Zinn, I suppose you were very much surprised when you received your commission. It came about in this way. When I was editor of a paper in Parkersburg, W. Va., I frequently read your editorials in the Barbour Democrat. I did not like the politics of the paper a little bit, but I did like your editorials, and when I was elected Governor I decided that Zinn must be a member of my Board of Agriculture."

As has been stated in a previous chapter, my first work as institute speaker was in West Virginia, and I felt that it was a case of an emergency more than that I was really fitted for the work. Like Moses, I was slow of speech and really knew but little about scientific agriculture. During my work in West Virginia I had the pleasure of having Dr. H. P. Miller, of Ohio, as my co-worker. After we had spent a month or two in the state-together, Dr. Miller went to Indiana to do institute work.

About the first of October of the next year I received the following telegram from Prof. Latta, Superintendent of Institutes of Indiana: "Could you give me four weeks of your time this winter in Institute work?"

On to Indiana

If I had been asked to accept an ambassadorship to some foreign country I would not have been more greatly surprised. I did not feel that I was competent to serve in the capacity of institute instructor in the mountain state of West Virginia, and could I dare go to Indiana? I wired, "Will let you know in a few days." I could not think of any one who could have recommended me except Dr. Miller, and I thought his judgment too good for that. I wrote Miller, telling him what had happened, and asked him to tell me frankly whether it would do at all for me to go to Indiana. His reply was, "I recommended you and don't fail to go."

I think it is a proper ambition not to want to disappoint one's friends. I wrote Prof. Latta I would accept the work. Never did a young farmer start out with more misgivings as to his ability to deliver the goods. At the same time never did one have a greater determination to succeed if success was at all possible.

The first day's travel brought me to Vincennes, Indiana. Leaving there on an early train I arrived at Oak-town, Knox county, in time for breakfast. I then asked the landlord of the hotel if he knew anything about a farmers' institute to be held there that day and the next. He replied that he had not heard of any such meeting. I concluded that Indiana was not so different from West Virginia after all, for I had had that to happen in West Virginia many a time. I made up my mind that if there was to be a farmers' institute in that town somebody ought to know it, and I set out to find that somebody.

A Hoosier Institute

I had not walked a block until I saw a man coming toward me who looked like a farmer. I decided to inquire of him. "Do you know anything about a farmers' institute to be held here today?" I asked. "Yes, Your name is Zinn. My name is House. I am the president of that institute," he said.

Much to my disappointment I was told that I was to be the only speaker. The meeting convened promptly at nine o'clock. I spoke twice before noon. Fortunately Captain House was a shrewd man and a good talker. After my first talk the Captain spent a few minutes talking while I rested and got my thoughts together for the second subject. Dinner was served in the basement of the church, and during the noon hour I got my bearings better and, what was more important, got acquainted with the farmers. I was on for two numbers in the afternoon and again at night.

They seemed determined to get all out of the West Virginian that he had in him, for I had four more talks for the second day. The clock on the wall said four. I was feeling relieved when a good old farmer arose and said, "Mr. Zinn can't leave here until tomorrow at seven o'clock, and I think we ought to have another night session." A lady said, "I second the motion, and we will give him an oyster supper." Before I could remonstrate, the matter was settled. I talked only fifteen minutes that evening.

First Lady Speaker

When he was closing the last meeting of the week, Capt. House said, "Friends, I owe Mr. Zinn an apology, and since the offense was public I want the apology to be public also. When I received the Institute Bulletin and saw that a West Virginian was to be the only speaker at our institutes in the county, I was provoked, and I said to my wife, 'What can a West Virginian tell us Hoosiers about farming?' Then he proceeded to pay me a very great compliment, which if I would record here my readers would say, 'Zinn is childish.'"

I had the pleasure of traveling with a woman speaker, Miss Mathers, the last winter I worked in Indiana. She was the first lady speaker I ever heard of in an institute. Fourteen years after that I was called to Ohio to speak in Ross county, and found that my lady associate was Mrs. Romine who turned out to be the Miss Mathers with whom I had traveled in Indiana. It seemed odd to have a woman on the force in Indiana. It would seem more out of place now not to have a woman associate.

Keeps Crows Away Or Your Money Back

Crows and rodents will leave you alone at planting time if you treat your seed corn with LIBERTY CROW SCAT. CROW SCAT is insurance against replanting.

For these pests are not known in fields planted with CROW SCAT treated seed.

CROW SCAT is absolutely harmless. Won't clog the planter, won't hurt the seed. On the contrary it insures maximum germination. Easy to apply.

\$1 invested in CROW SCAT means hours saved in replanting. 1/2 pint enough for 1 bushel seed \$1. 1 pint enough for 2 bushels \$1.50. You buy CROW SCAT with the distinct understanding of your money back if not satisfied. SEND NO MONEY. Just mail coupon. Pay on arrival. We pay postage.

Apothecaries Hall Co., Dept. FF1,
Waterbury, Conn.

Send up pint (exact quantity) CROW SCAT. I'll pay postman on arrival. You are to return my money if I'm not satisfied.

Eureka

Potato Planter

OPENS FURROW, DROPS FERTILIZER, DROPS SEED AND COVERS—ALL IN ONE OPERATION
MORE bushels per acre and less cost per acre result with use of Eureka One-Man Planters. This double profit increase pays for the machine many times. One man and team opens furrow, drops seed any depth, drops fertilizer if desired, covers, and marks next row. Furrow opens and seed drops in plain sight. Better start, bigger yields. Operates in any soil. Write today for catalogue describing largest line of planters made. Sizes for 1 and 2 rows, with or without fertilizer attachment. Special attachments for ground soil or field conditions. In stock near you. Eureka Mower Co. Box 755, Utica, N. Y.

EASY, CLEAN & FAST THRESHING

with a FARQUHAR "ALL STEEL"

Here is our new, modern Thresher. It threshes all the best ideas obtained from hundreds of successful threshers. It is so easily operated. Uses little power because equipped with Roller Barrels and Rockwood Pulleys. Does a fine clean job of threshing any kind of grain. Has large capacity and built to endure the heavy duty of long, hard usage. Write for Bulletin 529 and learn the results of both threshermen and farmers.

We also build Engines, Boilers, Sawmills, Hay Bales, Cider Presses and other implements. Catalogs upon request. A. B. FARQUHAR CO., Limited Box 546 YORK, PA.

KINKADE GARDEN TRACTOR

and Power Lawnmower

Practical, Proven Power Cultivator for lawns, gardens, suburban lawns, etc. New Low Price—Easy Terms. American Farm Machine Co. 1001 3rd Ave. S.E., Minneapolis, Minn.

Michigan ROBUST PEA SEED BEANS

Established by the N. Y. Seed Improvement Association for the purpose of distributing quality seed. E. L. NOODY, RUSHVILLE, N. Y.

A Thinking Job

(Continued from page 9.)

Toots' flashing look was the best answer he could have made. "Money? Yes, I reckon it will," he replied. "But this is a thinking job." He repeated the words with a caress in his voice. "A thinking job! Mr. Hakewill sir, I'll work for you. I'll work hard—if Daddy is willing for me to go—and thank you."

It was not an easy thing to do, but Toots put it up to Daddy and Nancy without any special pleading. He even steeled himself not to show any desire to accept Hakewill's offer. But he did not feel either of them, and though it hurt them to break the partnership they would not have stood in his way—they both realized that this was Toots' great chance—for any possible selfish consideration.

It was rather a sad little party in the cottage kitchen that evening, though all tried to keep up an appearance of good spirits.

"Well, I reckon you'll be passin' frequent on your snail hunts," said Daddy. "An' don't you forget that your home's here."

"Always, Toots," echoed Nancy softly.

"Daddy," said Toots somewhat later. "I've been thinking. You'll have to get some one to take my place, of course. What do you say to Mark Crumb? He's a wonder at gunning. You know why I left oystering, but Mark's really not that sort. Not like any of the rest of them. He said he'd go straight and he will. And I reckon he'd be glad of a chance to get into this business."

The idea caught Daddy. "You might Toots ran down to Mink Island in the motor-boat the next day and had no trouble in coming to terms with Mark, who was thankful at finding an unexpected avenue of escape from a business that was showing little if any profit. He could sell his beds at any moment, he said, though at some loss, which didn't matter so long as he could step directly into the place at the Bullseye. Eden was just as willing to quit, preferring to take service in one of the fleet boats to dragging along as they were.

Mark went down to the landing with Toots. "I want to tell you," he said as the latter got aboard the boat. "I paid for those shells. My conscience ain't right clean yet, but my pocket is."

Rose was coming ashore from the Stingaree when Toots dropped anchor off the Bullseye pier. "Hear you're goin' to leave us," said the big man. "In a way, that is. I always thought it would be a good thing if you could tie up to Hakewill. I won't say I mentioned it to him, but I guess I dunno him see how you'd fit in. I helped but what I'll kind of miss you, though."

"We'll be up and down a lot, south of Mason and Dixon's line," said Toots. "It isn't like saying goodbye, Mr. Rose. Unless you and the Stingaree leave the coast."

"Maybe the Stingaree won't take many more long trips," replied Rose. "Zach and I are looking for a land anchorage. You know how it is with me. She hasn't said yes, but I've hopes, Toots. I'm a rough man, not good enough for her, but—well, I've got hopes."

There was a thread of gentle regret running through Toots' happy thoughts as he walked back to the Bullseye. But after all it was not an actual farewell he was to take of Daddy and Nancy. He could see them—all his friends in Carbury—on his collecting trips along the coast with Hakewill. He had no regrets at leaving the town itself. Even when the Colonel was alive he had never felt Carbury held anything permanent for him anything that would take the place of the education he longed for. It filled him with wonder to realize that his chance had come at last, that he was going to get an education after all, by way of what had been one of his pet desires, a thinking job.

(The End.)

Step Up Your Yields with the John Deere 999

Increase your yields, improve the quality of your corn, have your crops mature from one to two weeks earlier.

You can get these advantages by using the John Deere No. 999 Corn Planter with Safety Fertilizer Attachment.

You are assured of accurate planting with the Natural Drop Seed Plates which will drop the correct number of kernels in every hill. The drop can be instantly changed to plant 2, 3 or 4 kernels, by shifting a foot lever. The 999 can be used for drilling as well as hilling.

How the John Deere Safety Fertilizer Attachment Does Its Work

The Safety Fertilizer Attachment strings out the fertilizer on both sides of the hill.

A layer of soil falls over the seed before any fertilizer drops, so there is never any danger of the fertilizer coming in contact with the seed and causing firing.

Covering knives mix the fertilizer with the soil making it quickly available as plant food; none is wasted.

This is the first SAFETY fertilizer distributor ever used on a corn planter—one that permits the use of highly concentrated fertilizer without danger of firing the seed.

Showing John Deere safety fertilizer distributor housing. Notice the divider inside which aids in scattering the fertilizer on both sides of the seed.

Let the John Deere No. 999 Planter help you to make your land earn more. See it at your John Deere dealer's store. You can get the 999 with or without fertilizer attachment. Write for descriptive folder. Address John Deere, Moline, Ill., and ask for booklet FH-636

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Make Big Profits! Scott's SOY BEANS

For soil improvement alone they pay for themselves. A valuable general farm crop. They make rich hay, pasture and nutritious silage and build up soil fertility. Will grow in poor soil. Any farmer can grow Scott's Soy Beans. Soy bean hay is richer in protein than any other annual crop of equal yield. Scott's Soy Beans are of highest quality and cost no more than the ordinary kind. And besides—we pay the freight. Our new Seed Guide is the best book we have ever offered. Write for your free copy today.

THE YOUNG PEOPLE

Some Queer Pets

THE question of the queerest pet we ever heard about started in Little Folks' Corner but the letters have been so interesting I am sure you will agree they deserve more space.

Young People's Editor.

Peppy Pet

ONE wintry morning after I had done my morning chores I came upon a frozen baby bat.

I picked it up and took it into the house. I thought it was dead but towards evening it began to stir, and before we went to bed it had proved itself a lively fellow indeed.

Peppy, for so I had named him, proved to be a pleasant pet although he was a bat. During the day I looked him in a box with holes and put him up in the attic, but at night I would let him out to play. He would sit on my hand or my knee and look at me as if to say, "Don't you think me a queer fellow?"

Time went on, and one evening when I went to fetch Peppy he was not there! I was very sad for Peppy had been a delightful companion. I had about given up all hope of finding him when in a flash! But he had learned the call of the wild and would not stay. Neither did I try to keep him for I knew he belonged to the outdoors.

Peppy continued coming for about a month. Then his visits began to be less frequent until at last he came no more. But I still treasure the memory of Peppy, the queerest and best pet I have ever had. Frank Hartl, Pennsylvania.

Buddies

ONCE I had a pet turtle and a pet cat. They played together all the time. But in winter the turtle went and buried himself in the ground and stayed there until spring. They loved each other dearly. They ate out of one dish and slept in one bed. But one summer a sad thing happened. The cat got sick and died. That was the turtle's first real sorrow and his heart was broken. That fall when he buried himself in the ground he went in so deep he never came out again. Pennsylvania. Eleanor Snyder.

Ella and Jim

Left No Address

LAST summer I had two pet woodchucks. They would lie in my lap and sleep when the sun was warm. When they were hungry they would open the screen door and come to the bread box and beg for bread. Their names were Ella and Jim. Early in the fall Ella left and has never returned. On November 15 Jim came in and ate a big meal, holed up under the kitchen and has never been seen since. Geneva Snodgrass, West Virginia.

AND NOW—!

THERE'S a great day coming soon—better than Christmas or Thanksgiving to some—the last day of school. Write and tell us how you feel about it. Are you glad or sorry?

Prizes for the new April contests will be worth working for. Ten prizes will be given to the boys or girls who submit the best paper on the following subjects:

1. Why I want to go to school.
2. Why I don't want to go to school.
3. Subject for cartoon: "The Last Day of School."

All letters must be written with ink. Give your name, address and age. Use white, unruled paper and blue or black ink for the cartoons. Contests close April 15th.

Send all letters to Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

This One Files

MY strangest pet was a flicker or yellow hammer. My father was walking in a field after a rain storm and heard a queer sound. He looked and saw a half-grown bird on the ground that had been shaken out of its nest. Father picked it up and took it home and we fed it on bread and milk and made it a nest out of a hollow limb of a tree.

As it grew older it would hop around on the floor and when my mother left the door open it would stand there and chase the chickens away from the door. It would fly on our heads and talk in bird language. It made friends with a little chick. Its favorite food was ants. It goes south every winter and returns in the spring with its mate. It still knows us and allows us to touch it. New York. Henry Stabb.

Still Remembered

I GOT my pet on a warm, stormy day. He was a baby raccoon, with nice gray eyes and soft fur. He would eat corn out of my hands. One day a dog came and killed him. We all felt like killing that dog but didn't have the nerve because it belonged to a game warden. We felt very sorry about our only pet and had a nice funeral for him in the garden as our cemetery.

He has a marker over his grave; a tombstone with this writing: "Rags Raccoon, aged nine months, five days. Only pet of Walton G. Metz. Gone but not forgotten." Pennsylvania. Walton G. Metz.

What Do You Think of This?

THE queerest pet that I ever had was a large blacksnake. My home was near a wood and this snake made its home in the cellar. Its door was a knot-hole where it went in and out.

I often heard that snakes liked milk so one day I thought I would experiment on it. I got a bowl ready with milk and set it out to see the result. I waited a few minutes, then out it came. It just took a few sips and crawled back in its hole. I did that now and then until the snake and I became friends.

But it got too bold and crawled around to the yard. Mother was afraid it would bite my little baby sister and told papa to shoot it. Pennsylvania. Kathryn Black.

This guinea pig is the pet of Lillie Shroyer, Pennsylvania.

Raccoon Rampages

MY queerest pet was a little raccoon. His earlier life was spent with his mother but he was caught by a hunter. The hunter thought he was dead but going home that night Coonie came to life. His first bed was one of Mother's silk dresses. Any one knows they don't grow on bushes, but Coonie seemed to think so.

My friends and I used to catch crabs and put them in the washtub for him to fish out. Often they would catch his tail and toes but Old Man Crab would have to let go because Coonie would behead him. After he was filled, he would run around the tub until a path was worn. I called this path his war-path.

In one way Coonie was like a kid. He once tore the top crust off one of Mother's rhubarb pies. He ate the rhubarb out of the pie. Sugar wasn't safe on the table if Coonie was around. He would hop on the table, lick his paws to make them wet, then go for the sugar until Mother caught him. Claude Wernitz.

(Will Claude please send an address?)

Woodchuck Likes Pie

I HAVE a pet woodchuck named Johnny. Daddy caught him when he was about three days old and we raised him on a bottle. He eats dan-

Johnny Woodchuck Likes Cherry Pie

dellons, cocoanut, cakes, candy, nuts, pie and drinks chocolate milk. He slept in the cellar this winter and came out for the first time on February 9th.

He romps around and plays funnier than a kitten or puppy. He turns one somersault after another. Edith H. Mellinger, Pennsylvania.

Sociable Bug

ONE day as I was on my way home from school, I saw a large bug walking across the pavement in front of me. I paused to look at it and it was a praying mantis, so I picked it up and took it home with me and made a pet of it.

It would eat sugar from my finger and would crawl upon my shoulder and sit there while I walked around the garden. When I went out riding I would take my pet along and it would sit on my hand or on my shoulder. It would keep pawing for me to talk to it. I haven't got it now as it died at Christmas time. Pennsylvania. Dorothy Gounder.

Editor's note:—In case you don't know, the praying mantis is a bug remarkable for its grotesque form and for holding its stout anterior legs in a manner suggesting hands folded in prayer. It preys upon other insects and is perfectly harmless.

Sniff This

Here is a tongue twister I would like for the readers of the Young People's Page to try:

"How many sniffs of sifted snuff would a snuff sniffer sniff if a sifted snuff sniffer snuffed sifted snuff?"

Martha Iris Rebecca Pope, West Virginia.

Sal-yen-ga!—Send your story to Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Althea Schaffer of Pennsylvania and her pet rabbit "Pete."

"Jimmie, the Skunk"

ONE real early, cool morning, the sun not yet risen, was showing glints of gold above the horizon, when I started for the cows to round them up for the morning milking.

Brownie, our dog, was sniffing along merrily wagging his tail when all of a sudden he stopped and began barking furiously at some little black object. He then began pawing frantically at his nose and eyes and wiping his nose in the grass with signs of utmost distress.

With a few quick bounds I was at his side, but the odor radiating from him soon told me the black object was a skunk. He appeared quiet and undisturbed and having handled the little animals before, I quietly placed one hand over his beautiful plummy black and white tail while with the same movement placed the other around him and cuddled him firmly under one arm.

He was only a little mite but soon learned we intended him no harm and with no sudden, startling movements we could hold him just as a kitten. Jimmie, as we called him, would sit in my arms and lap milk from a saucer. Between every few laps he would stretch out the toe nails of first one front foot, then the other, rake through the milk and then with utmost care lick each nail perfectly clean. He would then resume his lapping the milk. He loved to take a cold potato from us and would always run to a dark corner behind the door to eat it. Betty Bean, Pennsylvania.

Shorty

Bobby

Sarah Detweiler thinks Bobby and Shorty are great pets.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1. Cottenham, Eng.—Photo shows a good action picture of Mr. Scratchley bolting over the head of "Prince Allen," and grinning while heading for earth, in the Cambridge University Point-to-Point races.

2. Shanghai, China.—The famous two-wheeled taxis of China, with a combination driver and engine—a ricksha on Szechuen Road bridge over Soochow Creek. The leisered sailor is John Henry Blaising, Jr., of Coleridge, Nebr.

3. Los Angeles, Calif.—The giant new motor-hus, a double-decker of the Pickwick Motor Coach works, which carries 53 passengers and is capable of 70 miles an hour. For continuous

point-to-point speed the bus can undergo a complete substitution of its power plant in but 15 minutes,—a new note in motorcoach travel. Railroads change the locomotives of their cross-country trains—the new bus simply changes motors.

4. Phoenix, Arizona.—Photo shows the rugged slopes of Squaw Peak in the background and many-fingered Saguaro cacti in the foreground lending a spectacular note to the golf course of the Arizona Biltmore Hotel.

5. Omaha, Nebr.—Charlotte E. Worley, professor, lawyer and now a successful woman farmer is going to try and break her own record this year. She is going to try and pass the

\$125,000 mark which she took in this year from her farm products derived from her efforts at farming 3,200 acres of land in western Nebraska. She raises corn, oats, potatoes, wheat, alfalfa, some stock, and this year will introduce flax in the western part of the state.

Noted sculptor completes bust of Supreme Court Judge Edgardo Simone, internationally famous Italian sculptor, photographed with the bust of Associate Justice Harlan Fiske Stone of the United States Supreme Court which is nearing completion at his studio in Washington. Justice Stone is seen on the left, posing for Mr. Simone to make the final touches on the model.

Calving

-when a cow
needs a friend

HOW often have you lost wholly or partially the productive services of a good cow because of some disorder or disaster at freshening? What a hole it makes in your milk profits! And it might have been avoided. The system of even a healthy cow cannot meet the calving ordeal without a severe shock. After a winter of barn-feeding, when resistance is certain to be at low ebb, definite conditioning is indicated. It is the one sensible, money-saving course.

KOW-KARE will lift from your shoulders many of your worries. It should be added to the feed of every cow, two or three weeks before and after freshening. This concentrated formula of Iron, the great builder and blood purifier, plus potent medicinal herbs and roots, acts directly on the digestive and regenerative organs—helps put the cow in the physical vigor to perform her functions normally and without accident. KOW-KARE is used in leading dairies throughout the Country as a regular preparation for calving. Full directions are on the package.

As a general conditioner, to prevent diseases, and to aid the cow to convert her food into full milk yield, KOW-KARE enjoys a wide reputation. At a cost of a

few cents a day per cow, appetite and digestion are improved, assimilation speeded up, vigor to resist or recover from disorders are visibly promoted.

KOW-KARE is sold by drug, feed, hardware and general stores, \$1.25 and 65¢ sizes.

Write for FREE copy of valuable 32-page Cow Book. Tells what to do when cows are sick. A real reference book.

Lime Rock and the Human Race

By L. W. LIGHTY

IT was not a vain boast of Kentucky that her bluegrass region produced the handsomest women, the fastest horses and the finest cattle in the country. Lime rock was the basis of this superiority.

Who will say that the lime rock in Palestine is not one of the basic factors of the ineradicable race characteristics of the Jews?

Have you read Grote's History of Greece and particularly Creasy's story of the battle of Marathon? In the little valley of Marathon we have the picture of what a handful of men nurtured on time rock food and lime rock water can do to a horde of men from anywhere that happens. Those 11,000 Athenians with lime-nourished bodies and brains pitted against ten times as many Asiatics on a September afternoon decided the fate of the European and the American continents for the future.

In the hand-to-hand conflict the limestone valley folks (Athenians) lost 192 out of their 11,000, while the Asiatics were literally driven into the sea, left 6,400 dead and had seven of their ships burned. Not only was one Athenian able to chase ten, but he could throw down his spear, take up the chisel and fabricate out of lime rock art creations such as the world never saw.

Aside from historical lore I have personally explored a few hundred thousand square miles. Even though the soil was covered with a heavy layer of snow and ice the effects of the limestone rocks were to be seen plainly in the buildings and the countenances of the men, women and children, in the school houses and the general progressive social manifestations.

What Lime Rock May Do for Us Now

Doubtless we still have a lot to learn, but we know that the man who brings some lime to his farm periodically has annual crops of red clover. All clovers are soil builders, but the red clover is the foremost because it thrives almost everywhere and adjusts itself to our several rotations of crops. It is unsurpassed as winter feed and the roots are of such a nature that they put the soil in a fine mechanical condition. It takes great quantities of nitrogen from the air, making the soil more fertile by its growth.

As I write this on the 20th of March I look against a hillside almost a mile away that is a solid mat of green wheat. For a quarter of a century that hillside was becoming more and more barren and more eroded and was practically abandoned as worthless. A new owner gave it a coat of lime five years ago and at once had a fine stand and growth of red clover. Next he had a fair crop of corn. As he seeded it to wheat last fall he gave it another dressing of lime, so now that hillside is a pleasure to look at and surely better for the owner than a barren field full of gullies.

Millions of acres are lime-hungry and will respond generously when lime fed. Some states are just becoming lime wise. Missouri used less than 10,000 tons ten years ago, but last year 236,000 tons was applied to the soil. To use lime understandingly on our farms is invariably a profitable investment and many such investments should be made now.

Silently the Camera Tells the Truth

In my travels nearly always I carried a camera and took pictures of farm homes, because they were attractive and desirable or because they were unusually dilapidated and neglected. Always the owner was entitled to a copy of the picture and got it. I was surprised on a number of occasions how many improvements were made by a second visit when I

was invited to take another picture. The owners never saw the amount of junk and rubbish the place harbored until they looked at the photo.

I know farmers who have kept a record of the improvements they made on the place with a camera. It surely is more impressive than a written record. The old house, the old fences, the old wood and lumber piles have been replaced by a new house and ornamental fences or none at all, and the surroundings are planted to ornamentals. The unsightly wood and lumber piles are hidden by vines and climbing roses. The evolution of the "beloved" old homestead has been most complete and desirable.

Why Test Cows?

I see an article in today's issue about our milk laws. A. A. Borland states that pasteurizing kills all germs. Then why test cows?

I have talked with numerous farmers. They tell you the reason they tested was to have a market for their milk.

Why let men sit in swivel chairs and make such laws? Cannot the government stop it? It is a one-sided affair with the producer and consumer on the same side. We all have to help make up the state appropriations.

I understand New York state had the same rules but saw their mistake and abolished it. I believe in stable inspection and sanitation, but why test when we have to pasteurize?

A Subscriber.

THE new state law does not require cows to be tuberculin tested when their milk is to be sold as pasteurized milk. Tuberculin testing is required only when the milk is to be sold as certified milk or raw milk.

Thousands of people in the state use raw milk instead of pasteurized milk. I think no one would assert that raw milk consumers should not be protected from the possibility of an infected milk supply.

It is true that the tuberculin test is not 100 per cent perfect, but does any one know of any better test, or in fact of any human device that can be guaranteed 100 per cent perfect? The tuberculin test according to data that has been acquired from various states appears to run from 98 to 100 per cent in accuracy, and that is as nearly perfect as it is possible to get in this old world.

Healthful Milk Supply

New York state in the past has not been as particular about the tuberculin tests as has been Pennsylvania. Some Pennsylvania dairymen have bought dairy cows from sections of New York state with most unsatisfactory results. In fact, some of our dairymen refuse to purchase cattle from some sections of New York state on account of the tuberculosis hazard. You will agree with me that this is no credit to the state of New York and that Pennsylvania should not put herself in the position to be similarly classified.

Pennsylvania is now in an enviable position from the standpoint of tuberculosis eradication. If I am correctly informed there are thirty-six counties in Pennsylvania which are area tested, that is, 99 1/4 per cent or more of the animals in the county are free from tuberculosis. Eight more counties are ready for certification as area tested. This state of affairs is certainly conducive to a more healthful milk supply. The city of Philadelphia has passed an ordinance that after a certain date no milk will be allowed to come into that city unless from the tuberculin tested cows. Other cities are acting similarly, hence it is only a question of time until a man who has untested cows will find it difficult to market his milk.

While it is true that pasteurization kills disease germs, yet who wants to eat disease germs even though they are cooked? A. A. Borland.

A Year of C. T. A. Work

THE cow-testing association work in Pennsylvania continued to make material progress during the calendar year 1929. There were 32,484 cows on test during all or part of the year, a gain of 5,046 over the previous year.

Seventy-seven associations completed a full year's work. There was an average of 23,597.97 cows on the entire year basis. The average production per cow was 7,751 pounds of milk and 300.5 pounds of butterfat. There was an increase of ten associations over the previous year.

This is the third year in the history of Pennsylvania cow-testing associations that the average for all associations in the state was more than 300 pounds of butterfat.

Ben Middleton

scores another smashing victory

(Below) Katherine, who returned \$2,277.43 profit over feed cost in seven years

10,472 lbs. milk—400.9 lbs. butterfat average yearly production for 7 years with 27-cow herd

Records of the Fairfax County, Virginia, Herd Improvement Association show that during the last seven years Ben Middleton's herd which averaged 27 cows has an average yearly production per cow of 10,472

lbs. of milk and 400.9 lbs. of butterfat. . . One cow, Katherine, in seven lactations has produced 110,230 lbs. of milk and 3,956.4 lbs. of butterfat and returned in these seven years \$2,277.43 profit over feed cost. She is in perfect health and a regular breeder.

Skillful Feeder

To have 27 cows average 10,000 lbs. of milk and 400 lbs. of butterfat in one year is an accomplishment—to attain that impressive yearly average for seven consecutive years is a triumph in herd management. The Middleton herd is well bred, but breeding alone will not bring such consistent

results. It required real skill in feeding and handling the herd. During the fall, winter and spring Mr. Middleton feeds Larro Dairy Ration at the rate of 1 lb. to each 3 1/2 lbs. of milk produced. He

We asked Mr. Middleton if we might tell other dairymen about his success. His answer was: "I am always glad to pass on to other dairymen any of my experiences that may be helpful to them. Furthermore, it would be unfair of me not to say that Larro Dairy Ration has been a big factor in my success. It keeps my cows in good condition, keeps the milk flow up and as for profit over feed cost it is the best."

feeds Larro in the summer when his cows are on pasture, too—the amount being varied according to the quality and quantity of pasture and the individual needs of each cow.

Feeds Larro Year Round
Ben Middleton knows the value of Larro. His records show it. He knows, too, that pasture alone during the summer months is not enough. That's why he feeds Larro the year round.

If you are already feeding Larro you know its value—if you are not feeding Larro it will pay you to get acquainted with it at once. See your Larro Dealer or write for complete information about Larro.

The Cow with a Window in Her Stomach

By R. PRESLEY STEVENSON

AN operation putting a "window" in the stomach of Penstate Jessie II has just been pronounced successful by Dr. James F. Shigley, of the Pennsylvania State College veterinary department. Penstate Jessie II replaces the original Jessie whose death February 14 terminated a life that had gained her more fame than Mrs. O'Leary's cow burning Chicago in 1871.

The operation was performed by Dr. Shigley and Dr. S. I. Bechdel, of the Penn State dairy husbandry department, in order that experiments being conducted at the death of the first Jessie could be resumed. Research workers hope to solve many more problems through the aid of the new "cow with a window in her stomach."

Manufactured Vitamin B

The first Jessie contributed a great deal to science, so much in fact that if any mere animal were to be given a monument for service to mankind her name would be written near the top of the candidate list. Dr. Shigley, whose work was to see that Jessie remained in the best of health and continued to chew her cud contentedly, took great pleasure in showing her to State College visitors, many thousands of whom viewed her during her lifetime.

The part Jessie played in scientific research is outlined in Dr. Shigley's words: "Because of Jessie, a new bacterium was discovered. Through her, it was ascertained that every animal with the cud chewing habit has the ability to make vitamin B in its own personal stomach. Through her, much was contributed to the world's knowledge of vitamin B, which is very important to growth, for without it the body develops slowly, if at all. Most animals receive it from the outside by means of the food they eat, but Jessie proved that cows can manufacture all that is necessary in their own digestive systems."

Method of Test

Jessie I was born in 1923. She was a pure-bred Holstein and was registered as Penstate Homestead Jessie, No. 924062. From birth, her destiny decreed that her entire life should be devoted to experimental purposes. Until she was operated on at three years of age, she was one of a herd of seventeen calves that were being used to determine the effect of vitamin B on growth. Dr. Bechdel had charge of this experiment.

The entire herd was fed a mixture

from which the vitamin B element had been deleted. Despite this, however, Jessie, along with her sixteen companion calves, grew to maturity without blemish.

This led the experimenters to believe that cows have the ability to meet their own vitamin B requirements. This belief was further accentuated by the fact that when the vitamin B growth factor was removed from the rations of the experimental white rats in the college laboratory, the rats were greatly underdeveloped.

With this theory in mind, the experimenters decided that Jessie must have an operation. That was why a little later she had a "window" in her stomach, and her fame was spreading every day.

The new bacterium was discovered by Prof. M. T. Knutsen, of the Pennsylvania State College bacteriology department, and was named by him Flavobacterium vitrum. The pure culture of this organism, found in Jessie's stomach, was shown to be highly potent in vitamin B, which tended to prove that a cow has the ability to manufacture her own vitamin B, since the latter had never been included in Jessie's rations.

That vitamin B in milk is not dependent on the presence of this vitamin in the feed of the cow was also proved. This evidence tends to show that all cud chewing animals can make the vitamin in their first stomach by means of the bacteria that Professor Knutsen isolated.

False Economy

TO dairymen now inclined to slight their herds because new grass will soon be available, Prof. J. W. Bartlett, dairy husbandman for the New Jersey Agricultural Experiment Station, says, "Don't." Economy measures that reduce either the quality or quantity of the ration, Professor Bartlett points out, will result in reduced milk flow, a falling off in flesh of the cows, and retarded growth in the young stock.

"The well-fed cow that maintains her production until turning-out time will give an increased milk flow at a very low cost," states the dairy authority. "Therefore, it is better to order a carload of good mixed feed or legume hay to tide over until new grass is available than it is to use a poor grade of roughage because it can be bought cheaply. Quality should be the buyer's first consideration."

"If the silo is empty, it may be a good investment to feed each of the higher-producing cows three pounds of beet pulp daily."

Herd Owned by The E. D. Cooper Estate
Java Village, New York

You Can't Be Certain About Pastures—

BUT you can always be sure of satisfactory results from Quaker Dairy Feeds.

Don't take a chance on losing your profits and jeopardizing the condition of your herd by counting on an early pasturage which may be delayed by a late Spring. It is important at this time of year to continue to give your cows Quaker 24% Dairy Ration, the reliable milk-and-profit producing feed. The most successful dairymen rely on Quaker 24% Dairy Ration the year round. Ask your Quaker Dealer.

THE QUAKER OATS COMPANY, CHICAGO, U. S. A.

Quaker Sugared Schumacher—is the complete carbohydrate feed; combines perfectly with any Quaker high protein concentrate (24%, 20% or 16%). A choice feed for all young or dry stock; an entire grain ration for horses, steers, lambs and swine

Jessie, showing Dr. Shigley removing a sample of partly digested food through the "window." Dr. Bechdel is holding the rope.

Apples for Hogs

EDITOR, Pennsylvania Farmer: Your correspondent H. D. in your issue of March 15th writes very entertainingly of appetizers for hogs, and seems to know his Bermudas perfectly until he reaches the point where he declares that "Apples have no feeding value to speak of." From this we very strongly dissent, and to us it sounds like swivel-chair stuff.

After more than half a century of observation and experience we credit apples with a value for feeding hogs that is well worth considering, and that if rightly fed in proper combinations three bushels of apples are equal to one of corn for pork.

Some years before the World War, I had a neighbor farmer with whom I was intimately acquainted. Before we commenced farming we were school mates; later, during the more serious years of life, we consulted together; and there were never any "trade secrets" between us. He was a better business man than myself, and, in addition, was one of the most industrious individuals with whom I ever came in contact. He never side-stepped anything in the way of work; and had infinite patience for working out details. After finishing any unusual enterprise, he always had there-for reliable data to guide him should a similar occasion arise.

Something "to Speak of"

It was when both meat products and labor were much lower in price than at present. Smith had a large quantity of what he called "hog apples"—consisting of "drops" and otherwise unsalable fruit, and he thought out a scheme for turning them into cash. He bought a bunch of shoats, weighing around 100 pounds each. They were put up in pens, the apples picked up and measured and fed at regular intervals what the pigs would clean up quickly, care being taken not to overfeed. They grew rapidly, and when the apples were consumed they were "hardened up" on a few hundred pounds of meal, and then dressed for the market.

When the transaction was completed and the shoats and meal paid for, he had left to show for his apples 37 cents per bushel. At that time, picked apples—winter fruit—were selling at 35 cents on the Scranton market thirty-five miles distant. In this instance at least apples clearly showed a value "to speak of."

In 1901 I found myself with a farm on my hands for which I had little use. One circumstance—so considered—was an old orchard, composed largely of summer and fall varieties. There were a number of trees of a variety known locally as Richard Sweet that is now extinct so far as I know. They were formerly very popular for the making of apple butter, and people came for miles around to procure them for that purpose.

No Lost Appetites

The fall that I mention this old orchard being plentifully. Having no other use for the early fruit I drove to the orchard eleven hogs as soon as the early apples commenced falling, and left them there until the ground froze in November. They made a splendid growth and returned me good money for the fruit. Not being so methodical as my friend Smith, I did not weigh them at either end of the feeding period, so exact results could not be figured; but I was well satisfied that I received more for the fruit than I could if handled in another way. But much more gain will result from the feeding of a given amount of apples if they are picked up and fed at stated times and in proper amounts.

If you have ever heard the feeding of apples to swine discussed, you have without doubt heard it remarked how hogs get sore teeth and go off their feed in consequence. Here is where folks are mistaken—not as to hogs losing their appetites but as to the cause. Hogs are merely as indiscreet as are humans in their habits of feeding and stand it no better if as well.

G. W. Bunnell.

Susquehanna county, Pa.

8 Quarts a Minute with RAPID-FLO DISKS

Filter Every Can—Yet Quit Work on Time

Plop, plop, drop-by-drop, milk goes through old-fashioned filters, delaying everybody's way past quitting time—slower than ever on days you want to get away earlier. Waste time, waste money. Time saved is money earned. Old-fashioned filtering costs money, cuts profits because it takes so long.

No wonder Rapid-Flo, the new-day filter disk, has been welcomed by dairymen everywhere. Rapid-Flo has the speed of a milk train on the way to town. Rapid-Flo gets all the dirt in less than half the time. This advanced disk established an average period of less than five min-

utes to filter a 40-quart can of milk during extensive tests under actual farm conditions.

Your men can filter every can of milk you produce, with no more standing around waiting to pour another pail in the strainer, no more impatient jamming of the strainer on the can, which destroys the efficiency of the disk.

Rapid-Flo Disks are made of high-grade hospital cotton, under the same rigid sanitary conditions as the world-famous Johnson & Johnson surgical dressings and hospital supplies. Mail coupon below for Free Samples.

GET THIS FILTER DISK CABINET FREE

For a limited time your dealer can supply you with this attractive, convenient, steel disk storage cabinet (retail value \$2.50) free with an initial purchase of 600 Rapid-Flo Filter Disks. With the aid of this cabinet your disks are kept clean and dry and are within instant reach. Mail the coupon below for Free Samples of Rapid-Flo Filter Disks and complete information of the Free Sanitary Disk Cabinet.

INDIAN CORN HOG FARM, Dushore, Pa.

Farmer's Business Letter

FOR the first three months of this year livestock prices compare favorably with those of the first quarter of 1929, lambs excepted. For this period cattle and hog prices averaged almost exactly the same, this year and last. The lamb price average, however, was more than \$5 lower.

Receipts of cattle for the three months were about the same as last year, with the total the smallest in many years. Hog receipts decreased 6 per cent for the quarter. Sheep receipts at the seven leading markets showed an increase of 20 per cent over the first three months of last year. The combined total of all livestock is about the same so far this year as last year.

Stewers Gain
The cattle market showed a spurt during the first half of the week, but the gains were largely lost at the close except on heavy steers which held a gain of 25 to 70 cents over last week. Receipts were moderate, 35,000 here, against last week's very light run of 22,000, and comparing with 46,000 the same week last year and 45,000 two years ago.

Average price of steers this week advanced to \$12.40, comparing with \$11.75 last week, \$12.65 the same week last year and \$13 two years ago. Top cattle sold this week at \$15, at an average weight of 1,750 lbs., these steers averaging \$262.50 a head.

Lambs Still Lower
Lambs were mostly 25 cents lower for the week, even with some decrease in the run. The supply is very large, however, for the time of year, since Colorado and Nebraska feeders are still unloading at a rapid rate. The run here this week at \$4.00 compared with \$4.00 last week, \$4.00 a year ago and \$4.00 two years ago. And Colorado supplied 50,000 of the lambs this week against 55,500 last week.

Average price of lambs was \$9.75, against \$10 last week and \$16.70 a year ago.

The springers will soon start running in numbers, and there is nothing of an optimistic nature in the situation.

Hogs Steady
It was a very steady week in the hog market, which is to be looked on as encouraging in view of an increased offering. Average price for the week at \$9.50 was the same as last week, and \$1.50 under a year ago, though \$1.85 above two years ago. Prices are still at a profitable level for the producer. Eleven markets had 475,000 hogs this week, against only 419,000 last week, 505,000 a year ago and 678,000 two years ago. To date this year these markets have received 7,665,000 hogs, comparing with 8,127,000 last year and 10,130,000 two years ago.

The feeling in hog trade is a little better. In the futures market, April light hogs sold at \$10.35/10.70 this week, May lights at \$10.40/10.50 and September lights the same. The September quotation last week was \$10.25, September heavies sold at \$9.65 this week, with no sales last week. There were 31 sales in the futures market this week, against 32 last week. Its backers feel that this is a good showing.

Quiet Grain Trade
Grain prices showed very small changes this week, nor were there any wide swings from day to day. The trade is marking time and wondering what the Farm Board intends to do with the wheat it has accumulated. The Board has not said how much wheat it owns. Estimates run from 40,000,000 to 80,000,000 bushels.

The Department of Agriculture came out with its acreage forecast this week: A 2.8 per cent increase over the acreage given to corn last year was indicated by reports as of March 1. The government estimate is based on information received from about 50,000 producers. The corn area harvested in 1929 was 98,018,000 acres.

Potato planting intentions was 103.4 per cent of the acreage grown for harvest in 1929. Potato area harvested last year was 3,370,000 acres.

Other planting intentions estimated by the department were:

Oats, 102.5 per cent of acreage grown for harvest in 1929, barley, 101.7 per cent; flaxseed, 127.2 per cent; rice, 112.1 per cent; grain sorghums, 108.2 per cent; sweet potatoes and yams, 108.2 per cent; tobacco, 105.7 per cent; dry

edible beans, 114.6; peanuts, 94.9; soy beans, 118 and cowpeas, 112.5. Chicago, March 29, 1930. Watson

CHICAGO CASH GRAIN
Chicago, Ill., March 31.—The following cash prices ruled here today: No. 1 hard wheat, \$1.07 1/4; No. 3 yellow corn, 80 1/4; No. 3 mixed corn, 80 1/4; No. 2 white oats, 44 1/4.

HAY AND STRAW
Philadelphia quotations.—No. 2 timothy, \$18.50; No. 3 timothy, \$15.50; sample hay, \$13; No. 1 mixed clover, \$18; No. 2 mixed clover, \$15.50.

No. 1 straight rye, \$18; No. 1 wheat straw, \$12.50.

FEED MARKET
The following quotations are for transit and nearby shipment March 28, according to the U. S. Bureau of Agricultural Economics. They show the approximate cost of feed per ton (all in 100-lb. sacks) and grain per bushel in carlots arrival draft basis delivered on track at Philadelphia and Scranton rate points:

Barley, 12.00; standard middlings, \$22; four middlings, \$21; cottonseed meal, 13 per cent, \$16.25; gluten feed, \$36.50; No. 2 white oats, 55c; No. 2 Yellow corn, \$10.00.

LIVESTOCK

PITTSBURGH Cattle

Monday's supply was moderate, about 23 carloads, and the demand was not extensive or urgent. Buyers bid lower on everything and were able to buy steers at a decline of a quarter, in some cases more. Good fat steers of handy and heavy weights brought \$12.75/13, few above \$12.75. Good weighty killers went at \$12.25 to \$12.50, averaging 1,200 lbs. or over. Good handy-weight steers brought \$12.25/12.50, largely a few \$12.35/12.50, but they had to be good to beat \$12.25. Medium kind of handy-weight steers sold at \$11.25/11.50, buyers of this class getting more for their money than in the recent past. More light butcher steers were in evidence than in recent weeks, selling at \$10.50/10.75. Fat cows were scarce, few selling above \$10.75, but a few were well, not many going above \$8.50, but an occasional good young cow \$8.50 or more. Cows moved readily at \$8.50/8.75, looking dear as compared with better kinds. Bulls were weak and lower, with \$8.50 the outside figure for heavy weights and buyers refusing to pay that much at the close. A few choice handy-weight bulls brought \$8.75/9 but not many above \$8.50.

Inferior sheep, 3.00/4.00
Good to best lambs, 4.25/4.50
Medium lambs, 4.00/4.50
Culls and common, 3.00/4.00
Woolled sheep, 5.00/5.50
Woolled lambs, 7.00/7.50

Calves
Monday's supply was about 700 head. Good veal calves were stronger at \$15 per cwt. Others were dull and showed little change, selling at \$11/12.50 for seconds and \$8/10 for milk of culls.

CHICAGO Cattle
Chicago, March 31.—Today's receipts totaled some 17,000 head. Best kinds steady, others

SEEDS AND NURSERIES

LANCASTER COUNTY SURE CROP—Produce of Lancaster County, Pa. Seed corn, 100 to 150, \$1.00 to \$1.25. F.O.B. Gap. Wholesale prices on request. S. J. Stallard, R. 1, Gap, Lancaster Co., Pa.

VEGETABLE PLANTS—Look your orders for Cabbage, Tomato and other plants for May delivery. Special prices on large orders. R. B. Lookford, Franklin, Pa.

CORN SEED—Shelled, very early, high yielding. Blue, Sure to mature. Other tested and recommended varieties for husking and silage. Quaker Hill Farm, Box 1, Honesdale Falls, N. Y.

CABBAGE SEED—For quality and yield, Quaker Hill Farm, Box 1, Honesdale Falls, N. Y.

SEED POTATOES—Certified Michigan Potatoes, New York Russets and Rurals, Prince Edward and other strains, all from improved stock. Quaker Hill Farm, Box 1, Honesdale Falls, N. Y.

SEED OATS AND BARLEY—Certified Corn, Potatoes and other plants for May delivery. Special prices on large orders. R. B. Lookford, Franklin, Pa.

LANCASTER COUNTY SURE CROP SEED CORN—Produce of Lancaster County, Pa. Seed corn, 100 to 150, \$1.00 to \$1.25. F.O.B. Gap. Wholesale prices on request. S. J. Stallard, R. 1, Gap, Lancaster Co., Pa.

Soil Organic Matter

(Continued from page 5.)

After eight years the writer had soil of each plot of the two systems analyzed for soil organic matter and nitrogen. Having taken samples of soil at the beginning of each experiment I was able to determine what changes had taken place.

Here is what happened in eight years. The soil in permanent grass gained 20,329 pounds per acre of organic matter compared to 9,675 pounds for the rotation soil. The pasture soil gained 910 pounds nitrogen compared to 490 pounds for the soil in rotation. Each soil was treated with limestone, superphosphate and potash. Can you not see from these figures how rapidly you can build up a run down soil with permanent blue-grass pastures?

Manure Versus Commercial Fertilizer

Now in concluding this story on soil organic matter, let me see how commercial fertilizers compare with farm manure in maintaining soil organic matter. Let us select for our comparison four old Pennsylvania plots—those that have received six and ten tons manure every other year and the plot which has received 100 pounds potash and 300 pounds superphosphate applied also every other year. In each case the materials are applied to corn and wheat ground. We will include for comparison the average of the unfertilized plots. Results are based on average yields for first 40 years.

| | 6 tons 10 tons | 100 lbs. P. 300 lbs. S. | Unfertilized |
|---|----------------|-------------------------|--------------|
| Annual yield | 56.3 | 58.2 | 52.1 |
| Corn, bu. | 42.1 | 44.4 | 42.3 |
| Oats, bu. | 23.8 | 25.9 | 19.1 |
| Hay, lbs. | 3,894 | 4,225 | 3,990 |
| Total wt. crops | 17,252 | 18,652 | 16,498 |
| Lbs. soil organic matter per acre (end of 40 years) | 64,616 | 67,374 | 61,202 |

Here you have before you the open page of 40 years experimental results made possible by the joint work of the farm crops and soil specialists. Now you see what you may expect from the use of a commercial fertilizer containing no nitrogen as compared to manure. The yields are sufficiently impressive to speak for themselves. Then let us see about the organic matter maintenance during these 40 years—long enough to draw conclusions, isn't it? Well here is what has happened.

The ten-ton manure treated soil has in 40 years received 200 tons farm manure which supplied 40 tons of organic matter. This manured soil at the end of this period is found to contain only 3.1 tons more organic matter than the commercial fertilizer treated soil.

Without Manure

What is the conclusion? Simply this. In this type of rotation manure has been valuable largely in causing an increase in crop yields and has increased the organic matter to a limited extent by making it possible to turn down more crop residues. The actual organic matter supplied in manure has almost entirely disappeared. Our conclusion, then, is that it is entirely possible to maintain the soil organic matter in a grain rotation without the use of animal manure, provided you supply a liberal amount of lime, phosphorus and potash.

Where does the nitrogen come from when you use these two fertilizer materials? I have already told you. The yields given above show that enormous nitrogen has been supplied—all from the air supplied by the farmer's best little friends, the untold millions of soil bacteria so small you cannot see them without the aid of a microscope. But do you realize that on this soil we are talking about these little friends have supplied in forty years enough nitrogen (in addition to that lost in drainage water) to produce 1,135 bushels of grain equivalent to the nitrogen contained in five tons of nitrate of soda. Quite remarkable, don't you think so? What are you going to do about it?

EPENABLY NURSERY STOCK

FRUIT THE GRAPE VINE BERRY PLANT

FLOWERING SHRUBS AND ROSE TREES

APPLE TREES

Baldwin, Corlett, Delleme, Greening, Red, Northern Spy, Wealthy, 2 1/2, 4 to 5 1/2 each. \$2.00 per 100.

PEACH TREES

Elberta, Hale, Rochester, South Haven, 2 1/2, 4 to 5 1/2 each. \$2.00 per 100.

THE

NEW MAYTAG

Sets a NEW Standard for farm washers

THE MAYTAG has always been the favorite farm washer... the first washer to be equipped with an in-built gasoline Multi-Motor. The NEW Maytag, the latest and greatest achievement of the world's largest washer factory, more than ever appeals to farm women.

The NEW, roomy, one-piece, cast-aluminum tub, with quick-washing gyra-foam action... the NEW roller water remover, with enclosed, positive-action, automatic drain... the NEW quiet, life-time, oil-packed drive, with handy, auto-type shift-lever for starting and stopping the water-action... these and other new Maytag developments give the New Maytag value, usefulness and convenience that overshadow any previous Maytag, surpass any other washer.

THE MAYTAG COMPANY

Newton, Iowa
Founded 1893

EASTERN BRANCH:

851 N. Broad St., Philadelphia, Pa.

Branches, Distributors or Representatives in London, Berlin, Hamburg, Geneva, Genoa, Oslo, Sydney, Melbourne, Adelaide, Wellington, Buenos Aires and other principal cities.

A \$4,500,000 PRODUCT

Power Churn Attachment

The Maytag churn attachment is an aluminum churn of 3 gallons churning capacity. It sets over the gyra-tator post and utilizes the same power that washes the clothes. Water in the washer tub keeps the cream at the proper churning temperature. Easily cleaned, durable and a time and labor saver.

F-4-30

A Power Meat Grinder Attachment

By simply lifting off the Roller Water Remover, this New Meat Grinder Attachment may be set over the shaft head of the power leg. Grinds sausage, mince meat, chops nuts, raisins, fruit, relish, etc. Saves time and labor. The churn and the meat grinder attachments are additional equipment sold at reasonable cost.

You can grow MORE NO. 1 POTATOES by instantaneous dip seed treatment

Semesan Bel seed treatment produced the sound potato at the center.
The diseased tubers on each side were grown from untreated seed.

Semesan Bel treatment saves time Controls surface-borne diseases Improves and increases yields

As long as you do nothing to stop the development of scab, Rhizoctonia and black leg in your field, you cannot expect a big yield of No. 1 potatoes. These diseases not only reduce plant vigor, but also injure potato quality.

You can prevent this crop damage by treating seed potatoes the new easy way—with Du Bay Semesan Bel. Tests by authorities and practical use on thousands of farms have proved that Semesan Bel controls surface-borne diseases, increases yield per acre and generally improves the crop.

Instantaneous dip treatment

Old-fashioned, mussy soak treatments for seed potatoes mean wasting from an hour and a half to two hours on every lot of seed. Frequently, they result in seed injury. Semesan Bel treatment is instantaneous. And it is safe. Just dip the seed potatoes and plant. With this quick method, one man can easily treat as much as 400 bushels of seed a day.

Semesan Bel increases yields

In 1928 Maine tests, according to *Phytopathology* for January (1930), Semesan Bel treatment of clean seed produced a yield increase of 58.2 bushels per acre.

Farm Facts and Fancies

By ALVA AGEE

DURING a long lifetime of experiment with soils and crops Dr. Charles E. Thorne has seen the introduction of many legumes for soil improvement, and some of them have great value, but it is interesting to learn from some study of his new book, "The Maintenance of Soil Fertility," that in his estimation red clover has not been displaced as our most valuable legume. In one place, discussing the furnishing of nitrogen to the cereal crops, he says: "The common or medium red clover is the crop most generally grown for this purpose, and the experiments described in the previous chapter have shown it to be the most effective of the crops ordinarily grown."

The Nitrogen Supply

Drawing conclusions from long-time tests of a rotation of corn, oats, wheat and clover on limed land, Doctor Thorne says: "It appears therefore that if the supply of available phosphorus and potassium be made ample, and if the land be kept hospitable to clover by liming when necessary, the root growth of clover, grown in rotation with other crops, may be relied upon to furnish to subsequent crops, directly or indirectly, more than half as much nitrogen as that contained in the hay, and that the nitrogen thus supplied will so nearly meet the requirements of two or three crops following the clover that the application of nitrogenous fertilizers will be without effect on many soils and of relatively small effect generally."

Supplying Organic Matter

Comparing manure and clover as means of improving the texture of the soil, this author says: "There can be no question that manure or other fibrous material will improve the texture of the soil and increase its capacity to retain moisture, provided it is used in sufficient quantity. . . . It must not be forgotten that no practicable use of manure on the farm will so completely incorporate organic matter with the soil as will the growth of a good crop of clover, even though the hay be removed from the land."

An Index to Lime Supply

We can rarely go wrong in taking it for granted that a poor growth of clover is evidence of a soil's lack of lime. It is a test running along on millions of acres year after year. The Ohio Experiment Station has one twenty-year experiment whose results tally exactly with country-wide experience. Less than half a ton of clover grew where no lime or fertilizer was applied, and lime brought the yield up to nearly a ton. Lime alone usually is insufficient. The results of the experiment show an increase of fifty per cent over the lime alone when phosphoric acid and potash were added. Clover and the two mineral fertilizers make a great team and need to be hitched up and put to work by many a man who is disheartened by lack of soil fertility.

A Fast Worker

We are using far more nitrogen in the fertilization of crops than formerly, and its use will increase as big commercial organizations continue to call our attention to its need. I believe that this is to our advantage. Station tests indicate that it is out of the question to make some staple crops pay for their total supply of nitrogen, and legumes and manure must be a chief dependence for them, but the use of some nitrogen as a supplement makes the difference oftentimes between a discouraged crop and a thrifty one.

But we need to note Doctor Thorne's emphasis on the fact that nitrate of soda and sulphate of ammonia do not

stay in the soil very long but must be used in a single season or be lost. We see the effect of applications the second season, but that is from the organic matter produced in the soil and left in it by the crop to which it was applied. The supply of organic nitrogen is released when the soil warms up the next year and organisms go to work. Nitrogen does not stick around like phosphoric acid and potash, and only a trap can hold it.

Raw Rock Phosphate

Tests have been made at various stations to determine the relative values of acid phosphate, which we now call superphosphate, and the untreated rock. The results have not been in agreement, and that was puzzling. If raw rock was the cheaper source of phosphorus, we needed to know it. As time goes along we seem to have found that the raw rock may be the cheaper carrier for some acid soils, but that the superphosphate is far better for soils that have a normal amount of lime in them. Even in the case of acid land the raw rock may not yield as much profit as the treated rock. From a study of various tests Doctor Thorne concludes: "As a carrier of phosphorus alone, raw phosphate is distinctly inferior to superphosphate."

Annuities

A hard-working woman had nearly five thousand dollars to provide for her old age. She invested in the stock of a land-buyers' association that had some men of high local standing in its board of directors. It bought but could not sell, suits are being brought, and holders of stock are facing loss. When people have no children and have limited capital, I wonder that some of those thus situated do not buy life annuities from one of the great corporations of national standing that sell them. The money is about as safe as can be in this world, and is not taxable, and the income is not subject to the income tax. The payments, monthly, quarterly or annual, are larger than ordinary interest because the corporation gets the principal at the death of the annuitant.

A husband and wife can secure a joint annuity payable to the survivor till death. The advantages are safety, a relatively high return on the money if the annuitants are elderly, and certainty of getting it until death. One's banker can give the names of the three or four best known institutions engaged in this business. Of course all the capital should not be used in buying annuities as that would leave no extra funds for emergencies. We have readers so situated that they should consider this method of adding somewhat to income with safety.

Chard

THIS is one of the two leaf vegetables on which we can rely for an unfailing supply of summer greens. Leaves and midribs are sometimes served separately.

Plants should be thinned to a spacing of ten or twelve inches. If planting is done by hand and four or five seeds dropped at the proper interval, the labor of thinning is reduced. Plant three-quarters of an inch deep. Leave at least a foot and a half between chard and the next row of vegetables. Rich soil is desirable for chard. Like all leaf crops it needs nitrogen. Stable manure is good or a commercial fertilizer with a good amount of nitrogen.

In gathering chard, two or three young leaves are taken at a time from each plant. New leaves are soon produced, and greens may be had all summer and late into the fall, as it takes a heavy freeze to put chard out of business. Lucullus and Silver Leaf are good varieties.

Soil Fertility

WHEN man took possession of the land, the soil he found was created to produce food, not for man alone, but for all living kind, and the farmer's reward for labor and seed depends on the fertility of the land plus good seed bed, good seed and good cultivation.

Thus the farmer's success in annually growing bountiful harvests, largely depends on his ability to retain the fertility of the land while such crops are being grown, and it should be the work of the local Farm Bureau to devote much of its time in assisting the farmers in restoring the many acres of over-worked and under-fed land to its former producing power.

That was the object in mind held by those who fostered the Farm Bureau movement, and was practiced for some years with encouraging results in Harrison county and there is still room for continuing.

Success comes to the farmer who labors to repair the mistakes made in failing to retain the fertility of the land. Not until the farmer, like the prodigal, realizes his situation can he hope for a bountiful harvest; and in like manner the Farm Bureau cannot hope for a large membership of interested members, if they do not bring assistance to the farmer in restoring the land to its former fertility.

An Opportunity

The value of a heavy sod to the land cannot be overestimated, and the character of the sod is a reliable index of the fertility of the land, because when plowed down it furnishes a large amount of organic matter that becomes food for the following harvests.

I know of no place where the Farm Bureau can find a better opportunity to gain the confidence of farmers of the county than to devote much of its time in assisting them in improving the fertility of their tillable land and in developing a heavy sod on their grazing land.

The Farm Bureau has done much toward eliminating the boarder cows from the dairy herd, which is well and good, but the work of changing the non-producing acres to producing acres has been neglected. There is no question about the advisability of culling out the boarder cows from the dairy herd, but there is a question why the Farm Bureau has not taken a more active part in showing the farmer how to improve the non-producing acres on his farm.

The financial backbone of the agricultural industry in West Virginia rests on a bountiful hay harvest, and good grazing sod; without these the farmer faces failure, though he may grow a small acreage of potatoes and keep a flock of chickens on the side; but his main dependence is hay and pasture.

John D. McReynolds.
Harrison county, W. Va.

A Prolific Sow

HAVE read in your paper of some record brood sows and think we have one that is hard to beat. Her first litter was on March 21, 1928, ten little ones; second on September 20, 1928, eight pigs; third litter, August 28, 1929, eleven pigs, and fourth litter on March 11, 1930, thirteen youngsters, and all are doing fine so far.

This makes 42 pigs from one sow, and we raised 41 out of the 42. I think that is a record hard to beat. What do you people think of it?

L. A. S.

Pepper for Pests

THIS might help subscribers: Rabbits and woodchucks are bad here, but when they eat my beans, peas, carrots, cabbage or squashes I go out to the garden early in the morning when dew is on and sift cayenne pepper on leaves and little squashes. I have never been bothered again that summer when I have used this method of discouraging the appetites of these animals.

How Good Farmers Make Money in spite of markets

GOOD FARMERS have learned a lesson—they hunt profit in lower costs, which they can control. No man can control markets.

Successful farmers even add a little to initial costs in order to cut final costs! They buy and use tons of V-C fertilizer—and produce pounds or bushels or other units in greater number per acre and man-hour thus cutting the cost each unit must bear.

Not only do successful farmers push costs down—they push gross income up, for they sell at higher prices the earlier yields and better yields that V-C fertilizer brings.

Virginia-Carolina fertilizers, adapted to every crop and every principal type of soil, are more than ever a sound investment. Write to V-C Agricultural Service Bureau, Richmond, Va., for detailed information and the address of your nearest V-C dealer.

It Makes Potatoes Pay!

When writing advertisers please mention Pennsylvania Farmer

By R. P. KESTER

SPRING is here, is here! So say the almanac and the birds. But in many places it is buried under a foot or more of snow, and the howling winds are anything but the gentle zephyrs of spring time. But surely it is just around the corner, and a few days will see active farm work begun. I can remember when the different stages of farm work were mentioned by town and city papers alike as indicating the progress of the seasons. Now they are scarcely mentioned even by small town newspapers, so far have we become industrialized and city-minded.

Some time ago I mentioned here the need for improvement in tenant houses on the farm. We are prone to sympathize with those who must live in the slum districts of the cities because the landlords will spend nothing to make the homes they rent convenient or even sanitary. But such slum houses are not all in the cities, nor are all the parsimonious landlords city real estate men. Here is part of a letter received from a woman in an adjoining state, part of which bears on this subject:

"I am a constant reader of your articles in Pennsylvania Farmer. Sometime ago you wrote an article on homes or tenant houses for farm help. My husband is a hired farm hand, but I always find out what kind of a house I am going to get into before he will take a position. We will not take an old, dirty, tumble-down house. We have lived on three farms and have always had a nice home—running water in two of them, and a sink in all three. Our present boss is one of the finest men to work for that ever was. He has fixed up our house this year, and is now planning to put in a bathroom. Oh boy! how glad we'll be.

"How can any farmer expect a decent hired man to live in some of the houses, or shacks, that pass as farm help houses? Some I have seen were out back of the barn, close to the barnyard. I would much rather be a half-mile away.

"Well, Mr. Kester, I am going to ask you if there is any way to get a hired man to take a chance and go into debt to get a start at farming. My man has had several chances on a fifty-fifty basis and the owner find all the tools and half the seed and fertilizer. But, no, he will not take a chance. I told him he has not as much faith in himself as I have in him. I know he would make good, for he is that kind of a man."

That's what I call a good letter. You can feel the energy and realize the push there is behind it. A good man (such as she says hers is) and that kind of wife should be able to make good on a good farm. Of course, during the last few years the well-paid hired man has had fewer sleepless nights than has the owner of the farm. But it does seem as if we must be about out of the wilderness and that we shall soon see the promised land. This may be a good time for the farm-minded man and woman to go into business for themselves, provided they do not go too heavily into debt.

This lady has it sized up right. It would be taking a chance. In fact every farmer takes a chance when he invests in land, machinery, fertilizers and seed. The business of living is a series of chance taking, with the odds in favor of those who have industry and intelligence. Taking chances lends zest to life and the knowledge of having tried valiantly to win

is worth the price paid, even if financial success is not great. (That's enough of the sermonette.)

I had a mighty interesting letter some days ago from a friend out in western Pennsylvania. It was inspired by something I had said about taxation. He wants me to get it over to farmers and other "common people" that it is they who pay all taxes in the last analysis; that under our present plan taxes are passed on to the consumer by landlords, big business and corporations. In the end farmers and consumers in general would not see the difference even if taxes were "equalized" by placing a heavier tax on corporations and personal wealth. This tax would be added to services and necessities and passed on.

Well, there is a lot of truth in that. A politician said years ago when he was being criticised for taxing business: "Corporations are not tax payers; they are tax collectors." And usually plenty is allowed so as to be sure to have enough to cover possible taxes. After the war the movie people raised a big howl about the amusement tax of ten per cent on admission tickets. They claimed that it was an unfair burden on the public. Finally, it was removed on low-priced tickets. The admissions were reduced—twenty-five cent tickets were sold at twenty-two cents, fifty cent admissions were made forty-five, etc. This lasted a short time, but very soon they were put back to former rates, and the amusement people pocketed the tax that had been removed from the "dear pee-pul."

Friendly Talks

By
Edgar L.
Vincent

I STOOD and looked at a farmer man as he lay all alone in "the other room" of his comfortable country home. Flowers everywhere, window shades pulled down, so still, so peaceful the look on his face. Friends went around quietly and spoke to each other in whispers.

I looked everywhere, but there was no sign that he was taking his pocketbook with him. He had been a hard working man all his life. Folks said he was comfortably well off, and yet now that he was starting away on this long, long journey still he had not thought he would need any money.

And that is the way it will be with us all when life slips its cable and we pass out bound for the other shore. Millions of dollars in the bank, vaults full of railroad stocks; and still not a dollar, not a dime, not even a shiny five-cent piece in our pockets when life's great day comes, and still he had his treasures.

Under the shade of one of the big trees in the front yard two farmers sat talking together of the night when their neighbor sat up with them out in the cold barn, caring for a sick horse. In another place one woman was telling another how her little girl used to put up her hands and run to meet this cheery faced farmer when she saw him coming. And these were the things he took along with him, over to the other country.

And it will be so with you and me. The money we use in making our own homes and our own dear ones happy, the things we do to make our neighbors and the world better will be the things that are stored up for us in the memory of our loved ones and in the treasure house Over Yonder.

Potatoes require not only an abundance of plant food but it must be properly balanced for the soil conditions. This photo shows the effect on potato plants at the New Jersey Experiment Station when one plant food element, phosphoric acid, was omitted from the fertilizer.

SCATTERED about throughout 30 leading potato-producing counties of Pennsylvania, there are 1,297 growers who supplied the facts and figures on which this article is based. Included with them are 260 potato growers in Maryland and 327 in New Jersey who also furnished information on the use and effects of fertilizer in this survey made by The National Fertilizer Association.

These farmers were personally interviewed and asked questions regarding their experiences and observations in the use of commercial fertilizer. Some of these questions brought out valuable information concerning fertilizer effects on individual crops like potatoes. What these men had to say about yields, market quality, disease resistance and maturity of the potato and other crops is summarized here briefly.

One of the questions asked was "From your general experience what increases do you expect from the use of fertilizers on your most important crops?"

Another question was "Have you noticed any effect of fertilizer on the market quality of crops?" Still other questions were "Have you noticed any benefit from fertilizer in giving crops a quicker start?" "Resistance to disease?" "Earlier maturity?"

The answers given by nearly 1,900 potato growers in Pennsylvania, New Jersey and Maryland should represent very closely the cross-section of results that can be expected generally throughout those states. How they replied to these questions is shown in the following paragraphs.

Increased Yields

What crop increases? In Pennsylvania 1,297 growers estimated their yields at 130.4 bushels without fertilizer and 223.8 bushels with fertilizer, or an increase of 93.4 bushels per acre, as an average. New Jersey farmers reported only 66.2 bushels without fertilizer and 224.7 bushels with fertilizer, or an average increase of 158.5 bushels per acre. In Maryland the yield expected with fertilizer is 151.5 bushels, or 93.4 bushels more than without fertilizer.

Now, if we take the average farm price of potatoes on December 1 for the four years, 1926-1929, as the basis, we find these average increases to be worth \$120, \$188 and \$97 per acre, respectively, for Pennsylvania, New Jersey and Maryland. After deducting the cost of fertilizer and the expenses for labor, power and bags incidental to producing

What Potato Growers Say About Fertilizer

By H. W. WARNER

and marketing the extra bushels, there still remains a long profit on the investment in plant food. To this profit add a few cents per bushel for the entire yield on account of the higher market quality of the fertilized tubers.

What about quality? Do fertilizers improve the market quality of potatoes? That such is the case is a matter of rather common observation but it is worth while to report the experiences of farmers in these three states. The question was asked for crops in general, but for so responsive a crop as potatoes the findings should have a direct application. In Pennsylvania more than 70 per cent of the fertilizer users replied "Yes" to this question; in New Jersey, more than 80 per cent; in Maryland, more than 75 per cent.

Promotes Early Start

Quicker start? More than 90 per cent of the fertilizer users in Pennsylvania report that fertilizer gives crops a quicker start. The percentages for Maryland and New Jersey were even higher. The advantage of a quick, vigorous start, particularly in cold, backward seasons, is so well known as to need no special comment. Although, as stated before, the question was asked regarding crops in general, the answers include, and apply for potatoes as well as for corn and other important crops.

Greater disease resistance? Almost 40 per cent of the fertilizer users in these three states have observed that fertilizers increase the disease resistance of crops. While it cannot be argued that such treatment will control or prevent diseases, there is no question that well-fed plants are more vigorous and healthy and thus better able to resist diseases.

Earlier maturity? Nearly 90 per cent of the fertilizer users in these states answered "Yes" when asked if they had found that fertilizer hastens maturity of crops. This implies not only early crops, but also uniform ripening of the crop.

Crop insurance best describes the combined effect of quick start, disease resistance, early ma-

turity, good quality and high acre-yield. And these mean larger and more certain profit for the potato grower. The crop-insuring possibilities in the use of modern and approved practices, including liberal fertilizer treatment, are well illustrated by the achievements of the large numbers of Pennsylvania farmers who gained membership in the 400-Bushel Potato Club last year in spite of an extremely dry season.

The above statements express the summary of observations and experiences reported by many hundreds of potato growers with respect to the effects of fertilizer on their crops. Additional information given by these and 3,000 more growers in the other important potato producing regions furnishes some valuable data on the subject of "rate of application and its effect on net profit."

Taking the average price of potatoes for the past five years as the basis, fertilizer applications of less than 100 pounds of plant food (averaging about 280 pounds of fertilizer containing 20 per cent of plant food) returned average acre profits of \$83 after all expenses of fertilizer, harvesting and marketing are deducted. Applications of 200 to 300 pounds of plant food (averaging about 1,220 pounds of 20 per cent fertilizer) returned profits of \$126 per acre; rates of 400 pounds of plant food or over (averaging about 2,125 pounds of 20 per cent fertilizer) gave acre profits of \$151.

Evidence Favors Heavier Applications

The above figures on rate of application and acre profits include many from New Jersey and the Eastern Shore of Maryland where heavier fertilizer applications are needed than for most farms in Pennsylvania. The evidence strongly supports the using of plenty of fertilizer, somewhat more than the average amount used by all growers.

The reports of these hundreds of potato growers fully justifies the recommendations made for applications of 1,000 or 1,200 pounds in Pennsylvania and western Maryland, and 1,200 to 1,500 or more in New Jersey and on the Eastern Shore. The results of experiment station tests and the experiences of members of the 400-Bushel Potato Club in Pennsylvania indicate that the fertilizer should contain three to five per cent of nitrogen, eight to ten per cent of phosphoric acid and six to eight per cent of potash.

FROM LIFE

FOR over sixty years, all his working days, he trained and raced horses, always hoping for but never finding the great one that would bring him fame and fortune. He never knew any other occupation and would have been content in no other. His business would not appeal to all of us; but in this free land every man is entitled to live his life as he chooses, to live on minor successes while he dreams of greater ones.

MUSSEL SHOALS

LAST week the Senate passed the bill to create a federal corporation to operate the Mussel Shoals plant. This means more government in business, more federal employees, more waste, more loss and more trouble of various kinds. Let us hope that this bill gets no farther. The thing to do with Mussel Shoals is to lease or sell it to the highest responsible bidder, with only one string attached to the property—repossession by the government in case of war.

HOG FUTURES

IN the first month of its existence business on the hog futures market totaled 184 carloads, representing 13,250 hogs weighing 3,036,000 pounds. This new and only livestock futures market is said to be working to the satisfaction of all interests. But if it gets much bigger we may confidently expect somebody in each House of Congress to arise and denounce gambling in hogs as ruinous to the producers thereof.

TOO FAR

THE government of Saskatchewan has introduced what is known as the primary products act. It authorizes a vote of growers to determine whether marketing wheat through the pool shall be compulsory. If the majority should vote for compulsory pooling any other method of selling grain would be illegal. Maybe this scheme itself will be found illegal, but it is a good example of cooperation gone crazy. For the moment cooperation becomes compulsion it is no longer cooperation.

ANOTHER YEAR

ALEXANDER LEGGE has consented to serve another year as Chairman of the Federal Farm Board. It should be remem-

bered to his credit that his public service is at a great personal sacrifice. Probably he and his associates have done as well as any board could be expected to do with a law which they admit they do not understand and for which there is no precedent in our history. Time will show the fallacy of this law's stabilization plans, but the members of the Board are not responsible for the law or any part of it, and cannot be held accountable if impossibilities continue to be impossibilities.

POSSIBLE MASTER FARMERS

IN a short time we shall make the annual call for Master Farmer nominations. Pennsylvania Farmer readers and the public in general will be asked to send us the names of the farmers they consider most worthy of the title "Master Farmer" and all the honor it has come to imply. Nearly every section has farmers whose lives and achievements are a source of inspiration to those who know them well. The object of the Master Farmer movement is to find such persons and to extend their influence for good by letting more people know about them. There are many men of real Master Farmer calibre who have never been nominated, and there are others among the nominees of the last three years who missed an award simply because the number to be given was limited. No one can know the true qualifications of a candidate so well as his neighbors. That is why we depend on them to name the men to be considered by the judges. Candidates of former years will not be listed as nominees for the Master Farmer Awards of 1936 unless their names are sent in again this year. Blanks for making nominations will be published in an early issue.

THE PIGEON MYSTERY

FOR many years the disappearance of the wild pigeon has been an unsolved mystery. Some authorities thought that the great flocks which used to come to this region had been wiped out by disease. Others believed that they had merely changed their migration to some other part of the continent, but nobody could discover them. Now hundreds of thousands of genuine wild pigeons have appeared in California. Agricultural and game officials do not know how to handle them, for they are destroying grape buds and it is contrary to federal and state law to shoot them. Airplanes have been used to drive them away but without success. Feeding them grain, in order to save the buds, is now being tried. Thus far nobody has accounted for their disappearance or their reappearance.

WHAT AND HOW MUCH?

THE quantity of wheat held by the Grain Corporation is not stated. Various estimates are made, and no doubt some of them are too high. Whatever the quantity may be everybody knows that it must come to market sometime; also that as long as it exists it is more or less of a weight on the market, for nobody knows when or at what price the Corporation will sell. The larger the official stocks the greater their weight on the market, so exaggerated ideas about them are of necessity an influence contrary to the interests of producers. There is no reason why the Grain Corporation, which is a public agency, should not make public its transactions and every reason why it should do so. The public is entitled to the facts and their market influence and should have them. Recent wheat markets have been marked by rather wide fluctuations. The Grain Corporation is reported as buying on every break. Is it also selling on the bulges? The public is entitled to information about that too.

What is the Grain Corporation doing now much? is a question that should be asked until it is answered.

BUSINESS AND CONSUMPTION

THE Bureau of Agricultural Economics reports that consumption of meats is very little affected by decreased business activity and presents figures to prove it. The figures show, among other things, that the per capita disappearance of beef has decreased 2.8 per cent during the past winter while the per capita disappearance of lamb has increased 8.39 per cent. It seems to be that such figures prove, if they prove anything, that meat consumption is affected by business conditions. For they show an increasing consumption of the cheaper meats and a decreasing consumption of the dearer. The statistician may prove, by figures expressing supplies and disappearance, that total meat consumption changes little aside from the differences created by variation in production. A certain quantity of meat is produced and it is all used. But producers are interested little in mere volume of consumption. They are interested in volume and price together—the amount consumed at a good price, and the amount consumed at a low price. And they know that there is a vital difference in consumption between a period when business is good and labor is well employed, and a period when business is bad and millions of workers are idle.

If the learned author of the official bulletin which says that "meat consumption is little affected by decreased business activity" will come out to our mining and industrial districts and run a farm, a meat shop or a grocery store he will learn an impressive lesson about consumption and its relation to business activity and employment. A lesson that will be worth more to him and to the public than all the figures he can dig up about the volume of "disappearance" of meats, which everybody knows must be closely related to the volume of production at any time.

AN EARLY START

FEW farmers delay corn planting any later in the season than ground and weather conditions permit. But those who plant early have the best chance for a good crop, according to a survey of methods followed by 600 Ohio growers in the 100-bushel corn project. The group who produced 60 bushels per acre planted on May 20th as an average date for 10 years; those with an 80-bushel yield planted three days earlier, while the 100-bushel men got the seed in the ground on May 14th and the 120-bushel growers the day before. Corn planting time is more a matter of expediency than of predetermination, but it is well to bear in mind that the early Ohio birds got the biggest crops.

COMPULSORY GRADING

THE New York legislature is considering a compulsory potato grading law. Many large growers favor the proposal, but opposition is voiced on behalf of the small producers. It is feared that the latter, not equipped for grading, may be penalized in price when their crops reach the market labeled "Ungraded." The experience of eastern apple exporters with their "Unclassified" grade raises the question whether it is the use of such a label or the abuse of it that brings the price penalty. So many of the commercial apple shippers have dumped poor fruit on foreign markets under this euphonious label that Europe threatens to retaliate with an embargo. Meanwhile we recall that Idaho potato growers supply the high priced markets in our own territory. Their crops are graded by compulsion—not compulsion of law but of economic necessity.

Pennsylvania Farm Comment

By MILES HORST

New Story Next Week

Subscribers who read "Uncle Dresser's Money" or "Molly's Baby," by C. A. Stephens, will be glad to learn that we shall start another story by this popular author next week. And any readers who are not acquainted with Mr. Stephens' stories have missed something which they will want to make up by reading the coming tale.

"MILLY WOODBRIDGE'S TREK TO THE PACIFIC"

The title of our new story, is an account of pioneering in the Peace River country of Canada. The hardships and pluck of these early settlers from New England will be found of absorbing interest, and we urge readers not to miss the opening chapter, which will be found in the issue of April 19th.

RECENT investigation into the size of potato bags preferred in the various large centers of our country by the Packers' Produce Mercantile Agency has revealed some interesting facts. For example, Baltimore is reported to prefer the 100-pound sack; Buffalo, N. Y., prefers the 150-pound sack. Harrisburg seems to be turning from a preference of 150-pound sacks to the 120-pound sacks. Newark, N. J., shows no particular preference, taking bags running from 90 to 100, 120 and 150 pounds at approximately the same price standard. In Philadelphia the 100-pound sack is undoubtedly the most popular package. Here the 150-pound sack now sells at a discount. The same thing is true in Pittsburgh.

Taking the small package such as the 15 or 30-pound package the demand in all of these centers for it is reported to be small. In Buffalo where three cars of 15-pound package potatoes were sold last season reports indicate that very few repeat orders for it were received. In Newark, on the other hand, the demand for the smaller consumer size package has increased noticeably during the past year and practically all of the potatoes received on this market from Idaho during the past year have been in this size package. In Philadelphia the 25 and 50-pound packages are being sold in a limited way to a special trade, but potatoes in these pack-

The above photo shows the exhibit of the Indiana County Milk Show, held last month. There were sixty-nine exhibitors. Forty-eight of the sixty-nine had bacterial counts of less than five thousand. Fourteen had counts of less than one thousand. The average total score was 94.3 for the sixty-nine exhibitors.

Five hundred farmers attended the Milk Show and other exhibits of dairy and barn equipment. The Show will have a large influence in promoting higher quality of milk in the county. John W. Warner, County Agent

ages cannot be moved in large quantities as yet in that city.

MANY requests come to this office in connection with school finances. Here is one asking for the maximum millage school districts in this state can levy.

Section 537 of the School Law of Pennsylvania states: "In school districts of the second class the millage shall not exceed 20 mills on the dollar, and in school districts of the third and fourth class shall not exceed 25 mills on the dollar, on the total amount of assessed valuation of all property taxable for school purposes therein: Provided, that each school district of the second, third and fourth class may also collect a per capita tax on each

resident or inhabitant of such district over 21 years of age."

LAST week I tested my seed corn, which was picked out last fall and stored away carefully for the winter. It showed a germination of 90 per cent. I tested corn selected from my cribs which showed a germination of but 72 per cent.

My findings in regard to my own corn are much in line with those of farmers in many of the corn growing sections of this state. Evidently if we want a good stand of corn this season we must use more than ordinary care in selecting seed.

THE Fat Cattle Show, to be held in the Lancaster Stockyards, June 18 and 19, will feature a better quality of cattle this year than it has in past shows. A committee of three commission men consisting of Walter W. Dunlap, John M. Hooper and Charles Lyons has been appointed as a special committee to weed out all undesirable cattle before they reach the exhibition pens.

HARRY SMITH, a 19-year-old club boy of Union county, and Herbert Enders, a 16-year-old boy of Montgomery county, will represent the Keystone State 4-H Clubs at the National gathering of 4-H Club representatives, to be held at Washington, D. C., June 18 to 24. Both of these boys have done outstanding club work in their communities and have proved themselves to be real leaders of young people.

WHEN all is done and told the women do most of the weeding in our farm gardens and most of it is done with the ordinary hoe which makes weeding slow and back-breaking. It is surprising how much easier it is to do the weeding with a wheel hoe with a man between the handles in a garden where the vegetables are planted in rows. It is still easier to do the weeding with a horse and a small cultivator when the garden is so arranged that the rows of vegetables run clear across, making horse cultivation possible. One man with a wheel hoe or a horse cultivator will do more weeding in one hour than a woman with a hoe can do in a half day and he will do it with much less energy.

ONLY half as many cases of hog cholera have been reported in Pennsylvania so far this year as during the corresponding period in 1929, and the number is far less than the average number of cases reported during the previous five years. The reason for this good showing in the control of this dreaded hog disease is the increased use of vaccine as a preventive measure and the regulation of the sale of hogs at public auction. More than 13,000 hogs in the state were vaccinated during January and February. The present law requires that unless the hogs are raised on the farm where sold they must be vaccinated 30 days before the date of auction.

BARLEY is gradually taking the place of oats in Northampton county. It is estimated that the barley acreage in that county will be increased from 20 to 25 per cent over that of last year.

When the proper varieties are planted, it will yield from 45 to 50 bushels per acre. In feeding value per bushel it ranks between oats and corn. It easily fits into the regular rotation now used in Northampton and other southeastern Pennsylvania counties.

During the past two weeks, 1,500 bushels of velvet barley seed was shipped into the county from Minnesota and distributed among many farms. It appears that this variety according to variety demonstrations conducted in the county last season was one of the best yielding varieties in the test. Two other varieties that yielded well in these tests were Wisconsin Pedigreed and Featherstone.

JESSE INSCHO was elected president of the Tioga County Agricultural Extension Association at its annual meeting held at Wellsboro last week. Frank Bley was elected vice-president; James S. Blair, secretary; and A. D. Prutsman, treasurer.

Forty-four dairymen of the county whose herds last year averaged 300 lbs. or more of butterfat per cow were awarded ribbons.

In his survey of plans for 1936 County Agent Korb stressed farm accounting. Two large groups of farmers in the county are participating in this project. Dairymen, including dairy calf clubs, will be another major project.

The addresses of the day were made by H. G. Niesley and W. R. Gordon, extension specialists.

Penshurst White Fico, a Potter county bull association bull owned by the first cooperative Ayrshire bull association of America. This association was organized in Potter county.

POTTER, near the center of the north tier of Pennsylvania counties, has in recent years been the scene of interesting agricultural developments. One of the last strongholds in the Keystone State of the large lumber mills, tanneries and acid factories, Potter county slumped when these industries exhausted their supplies of raw materials and departed. Farming was then a side issue, but it suddenly became almost the sole support of the county's economic life. Under the leadership of an able county agent agriculture rose to the occasion.

The extent of the county's recent rural development is set forth in the last annual report of the county agent to the Potter County Agricultural Extension Association. Before quoting part of this report the following statistics may be cited to answer the question, "What does a county agent do with his time?"

In conducting the Agricultural Extension Service in Potter county last year County Agent Bert Straw traveled 19,800 miles by car, made 1,801 visits to 1,300 different farms, took care of 1,198 office calls and 3,315 telephone calls, spent 61 days in office and 239 days in field activity, wrote 2,100 individual letters, held 94 method demonstrations, conducted 189 definite result demonstrations, held 331 meetings with 4,972 in attendance, and distributed 583 bulletins.

The annual meeting of the Potter County Agricultural Extension Association for the year 1929 was held in the Coudersport Scottish Rite Consistory Building. About 700 farmers and townspeople attended. Giving his annual report at this meeting County Agent Straw said, in part:

A Market Opportunity

"We are gathered here to concern ourselves with the economic welfare and economic possibilities of our county and each of our communities. When we met here on a similar occasion two years ago I endeavored to make clear to you the fact that because of her certain peculiar conditions Potter county had a very potent opportunity in the social and economic organization of this country, that we are in the very heart of the greatest consuming center of the whole country, and, that the entire production of the farm commodities that are normally produced in Potter county do not supply the annual increase in the demand for such commodities in the Pennsylvania markets.

"On this former occasion it was explained that

Potter County Agriculture Rises to the Occasion

those farmers who had followed the improved practices of potato production had increased their average yield more than 100 per cent. Since that time we have had an increase of 30 per cent in the number of potato growers using these methods. I told you that during the eight years of potato spraying work in Potter county the actual measured increase in yield due to spraying sold at the average market price for those eight years showed a net amount of nearly \$4,000,000. The past two years have added over \$800,000 to that figure. The records at that time showed a 60 per cent increase in yield due to the use of good disease-free seed potatoes. During the past two years there has been a 75 per cent increase in the number of growers using disease-free seed.

The Dairy Business

"Two years ago you were told that the production record keeping system of our cow-testing association work had increased the average annual milk production per cow 1,100 pounds in three years. It took just seven times that long to increase the average production of all the cows in the New York milk shed 1,100 pounds. During the past two years we have had an increase of 200 per cent in the number of dairymen keeping such records.

"It was explained at that time that the producing ability of the next generation of cows in any dairyman's herd will increase only if he uses sires from cows with a known high production record. During the past two years we have assisted in the placing of 45 such bulls among the dairy herds of the county.

"It is a well-known fact that the greatest possible production can only be arrived at through the feeding of well-bred stock. You were told that demonstrated methods had proved that the calf club was the best medium for establishing new pure-bred herds. We now have more than 100 boys and girls in the county who are anxious to own a calf and whom the banks of the county are willing to finance. It has been impossible to purchase that number of calves from cows with proven high production ability. This fall's crop of calves has made available approximately thirty suitable calves within the county. These will be distributed as soon as they are old enough to move.

"The Galeton Ayrshire Calf Club has finished one year's production. The market value of the first year's total production of the cows in that club amounted to more than the feed cost for the year and the original cost of the calves.

"There has been an immense amount of talking and publicity about legislative or government assistance for agriculture. The solution to the farmer's problem rests with himself. His yield or production per given unit, whatever the operation

may be, must be sufficiently large to return more on the market than the total cost of production. The farmers of Potter county have eliminated many antiquated and expensive production methods. More must go.

"In order to prove and point out the weak spots in the production system, we have interested a large number of farmers in keeping cost of production records. More than 100 cost of production records on potatoes will be summarized in Potter county this year. Eighty-five cost of milk production records are being kept. Two groups of poultrymen are keeping cost accounts on their flocks.

"We must know the cost of production, then make our yield large enough to return at the average market price more than those production costs. What the farming industry in Potter county needs now is a stronger sentiment for cow-testing association records and other cost accounting. These practices will eliminate inefficiency, lower costs, and increase the possibility for a profit.

"During the past ten years the number of producing dairy cows in Potter county has increased from less than 8,000 to over 16,000. The average milk production per cow has increased from 3,200 pounds per cow to over 5,000 pounds per cow. The price of milk has increased from less than \$1.50 per hundred pounds to over \$2.50 per hundred pounds.

Progress with Potatoes

"During the past ten years the acreage of potatoes in Potter county has increased from a little over 3,000 to more than 8,000 acres. The average yield per acre has more than doubled during the past ten years. The total annual production of potatoes in Potter county has increased from less than 400,000 bushels to about 2,000,000 bushels.

"In 1929 Potter county kept more than five times as many laying hens as she had in 1916. The average egg production per hen is now more than twice the production of ten years ago.

"On January 1, 1917, the total bank deposits in all the banks in Potter county amounted to \$2,649,744.65. On January 1, 1929, the total bank deposits of all the banks in Potter county amounted to \$4,264,515.47.

"This increase of \$1,614,773.12 in bank deposits has taken place in Potter county in spite of the fact that the industrial payroll of the county has been reduced more than two-thirds. The railroad payroll has diminished practically one-half. Four large sawmills have been removed from the county during that period. Three tanneries have ceased operations and one wood chemical plant has been dismantled. Two large glass factories and a large number of smaller industries have vanished.

"The farmers of this county (Cont'd on page 23.)

1. Potatoes have come to play an important part in Potter county farming.

2. Many up-to-date dairy barns have been built or remodeled during the past fifteen years.

3. The farm barn of twenty-five years ago is rapidly fading from the Potter county landscape.

An Orphan Room

By MARION COSSITT BRACKIN

had a little orphan room, and it was bleak and bare; whenever I went into that room it filled me with despair. I took that room in hand one day, and now I'm glad to say that all the folks who go in there just love to stay and stay.

THIS room was my "store room," and it looked like a cupboard. An unfinished floor, white plaster walls, a couple of store boxes, a glaring light from the center of the room. But the possibilities of this room intrigued me, its pleasant view from the two windows, its cozy size, hinted to me what a jolly little den it might become, with a little work on my part, and a little, oh, a very little expense.

So we tinted the walls and ceiling a deep pretty cream color. Then it didn't take long to stain and varnish the floor, and lay a couple of pretty braided wool rugs. One store box was removed from the room and the other was covered with a gay but heavy cretonne in a hand-blocked effect, even though it had been bought at a bargain and cost very little.

A small family antique table which had previously refinished, stands in the corner of the room, with a handy desk light on it. As the table is just the right height for comfortable writing, and has a drawer, it makes a fine little desk. A low dresser with a long mirror was taken from another room and placed in the little den. A bed-light hooked over the top of the mirror gave a subdued but efficient light.

We put some of our most dearly loved books in here, a couple of the fiber porch chairs, newly varnished, and another very inexpensive but charmingly antique looking bridge lamp near the rocker. The curtains are made of rayon casement cloth, straight and very easily laundered. And, do you know, the room is transformed!

We love to read here, write here, chat here. It is one of the most homelike and cheery little rooms in the house. And we enjoy it the more because we achieved it by a little adventure in decorating.

All Aboard!

HAVE we some readers who might be interested in going overseas to attend the Conference of Rural Women of the World? The meeting is to be held in Vienna, Austria on May 27th, 28th, 29th and 30th, and the party will be chaperoned by Mrs. A. E. Bridgen of New York. She is the official delegate from the United States.

Before and after the meeting the United States group will visit in France, Germany, Hungary, England, Holland and Czechoslovakia to study the work of country women in those countries. This group will sail from New York on May 2 and return to the same port July 6.

It seems to me this is a wonderful opportunity for rural women's organizations to send delegates to such a distinguished gathering that will provide untold inspiration. Membership is open to either men or women. Reservations can be made through Mrs. A. E. Bridgen, 121 Westminster St., Rochester, New York.

Granges, Farm Societies, Farm Bureaus, Women's Clubs, Parent-Teachers Associations everywhere, think this over, and act at once before all reservations are closed. Readers who attend, please write us of your plans. G. S. S.

Wax Reduces Dusting

RECENT scientific tests made by a well-known Wisconsin concern, for forty years interior finishing authorities, show that fifty per cent less dust settles on waxed furniture than on surfaces finished with ordinary polish. Dust that remains on the wax stays on top, does not become imbedded, and is easily whisked off.

The wax film dries absolutely hard and soft,

The

Farm Home

sealing dust pockets, and also provides a protection against all kinds of scratches and stains on chairs, tables and woodwork.

Prize Cake Recipes

A MODEST reader who did not sign her name may have the checkerboard cake pans for this week's prize if she will write us and send her complete name and address.

She writes that these are goodies which always make her family smile. She has five happy children.

Upside Down Peach Cake

One egg, one cup flour, one-half cup hot milk, one-half cup sugar, one and one-half teaspoons baking powder, pinch of salt. Also one cup brown sugar, one-fourth cup shortening, three cups sliced peaches.

Method: Melt the brown sugar in a skillet with the shortening. Then add the (canned) sliced peaches. With the other ingredients make a batter

POCKETS FOR PATTERNS

A FOLDING screen is often part of the sewing equipment. It may be used either to cut off the view of disorder if the work must be hurriedly stopped, or for protection during fitting. It often serves as a place on which to pin up partly finished work, and various ways have been devised of making such a screen hold small sewing accessories. When not wanted the screen is folded up and put away.

One use of this kind is shown in the picture, taken by the Bureau of Home Economics of the U. S. Department of Agriculture. Pockets similar to show bags were made on a width of material as large as two panels of the screen. Osnaburg, a durable and inexpensive household cotton fabric, which has become widely known, was used for the 30 pleated pockets hung on the screen. Patterns and findings are then stored in a very handy way within reach of the person working at the sewing machine.

as for any cake. Pour this batter on top of the skillet mixture and bake. This cake is good served either hot or cold with cream.

Note: As with all skillet upside down cakes, be very careful in removing them from pan. Turn them so that the nice fruity caramel mixture is on top, and serve them at the table as you would a strawberry shortcake.

Apple Cake

Two cups flour, three teaspoons baking powder, one-half teaspoons salt, two tablespoons shortening, one-half cup milk, sliced cooking apples, one-half cup sugar, one teaspoon cinnamon.

Combine the first five ingredients as you make biscuit dough, and press into pan about one inch thick. Cover with apples, sugar and cinnamon. Bake until apples are tender and nicely browned. Served with top milk.

Winner, please send us your name. Address the Baking Contest editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Preserve Bird Life

By HEPSY NEFF

"WITHIN 25 years after the last birds have been killed the last man will drop into his unburied grave, according to Lieut. Col. C. Seymour Bullock, national field representative of the Izaak Walton League of America, in Science Service. No man can live in a bird-less world, says Col. Bullock, for without birds there can be no grain and no grain means no food for man."

The above statement will be challenged by nine out of every ten persons who read it. But farm dwellers everywhere know that our bird friends are decreasing and are equally sure that our insect enemies are increasing. One need not be too distressingly old to remember a time when the eaves of our barns were fringed with the mud nests of swift-winged barn swallows spending their days catching the low-flying moths that supply something like thousands of eggs apiece that hatch more insect pests. At that time we gathered perfect apples from orchards that had never known a touch of spray. Will our children ever know such an experience?

Standing at the head of dependable and helpful information ready for use in our effort to encourage an increase in our bird friends is our Department of Agriculture with more than a dozen free bulletins about birds and their relation to the farmer. Next to these helps is the National Association of Audubon Societies with headquarters in New York City and a postal card so addressed will reach them.

A few years ago a big hotel in the Far South had a visit from purple martins and to rid the neighborhood of the annoyance the unthinking proprietor invited his neighbors to help themselves to the feast. The Audubon Society heard of it and sent a representative down there who was able to prevent further slaughter by firing empty tar-barrels in the evening and the smoke drove the birds away. Estimates of the number of birds killed went above 10,000 and the offending citizens were prosecuted and fined in the local court.

Plainly the time has not yet come when the friends of either birds or men can afford to keep silent.

What Are You Doing?

WHAT is your community or your club doing to make May Day 1930 Child Health Day? "Every Parent and Every Community United for Health for Every Child"—this is the slogan for our activities.

Pageants and plays, parades with floats symbolizing health, window displays, school festivals, church celebrations, radio programs, May Day festivals, outdoor health games and plays—these and many other suggestions may give you some idea what

might be done to arouse your own community to better health for every child.

If you need help of any sort, write at once to the American Child Health Association, 370 Seventh Ave., New York City.

Timely Tips

DO the children's appetites lag? Perhaps they are bored with the same things over and over again. Try new cream soups, a change in puddings and custards, and variations in your menus.

"Scottish Fancies" are wholesome and the children like them. Here is the recipe: One egg, one-half cup sugar, two-thirds tablespoon melted butter, one cup rolled oats, one-third teaspoon salt, one-fourth teaspoon vanilla. Beat egg well, add sugar gradually, then remaining ingredients. Drop by teaspoonfuls on a greased pan. Bake in a moderate oven till they are delicate brown.

Why Do I Plant a Garden?

"WHY do you bother to plant a garden, when you are just one person living alone?" asked a visitor, one day. "You could buy the small amounts of fresh vegetables, in the neighborhood, with much less trouble."

This is what I told her: I came from the city and bought a small country home in the hills. Much of my younger life had been spent in a town where back yards were of good size for gardening, and to me, a home could not be real if it lacked garden space.

Taking possession in early June, the only available space for vegetables or flowers was a patch 50x50, beside the house, open to the road. It had been cleared and fertilized the previous fall. Around my new home were perhaps a dozen houses, scattered along the valley within a radius of a quarter of a mile. My neighbors passed often, lingering to see and be amused by the ways of the "city woman" in planting and cultivating.

Planted Flowers, Too

They saw, and from them I learned more than they realized; and having good seed catalogues and other garden literature, I "put over" my first-year garden in professional style, having an abundance of good vegetables for myself and occasional guests, with a few to give away. I edged the patch with some quick-growing annuals, and had many flowers. When not busy with serious garden work, and getting settled indoors, I attacked the tall weeds in another 50x50 patch behind the barn. This plot my predecessor had used for corn and potatoes and the ground was well plowed up and fertilized in the fall.

The next spring, I planned and achieved a regular vegetable garden in that rear lot. The front garden, by degrees, was laid out for flowers, with both perennials and annuals, shrubs as I could afford them, and across the back of it, as background for flaming Oriental poppies, my asparagus bed. Each year thereafter brought improvements—and experience.

Two Crops

In beginner's fashion, I planted seed generously, with a view to putting up my surplus for winter use; but by the middle of that second summer I was being besieged by the "summer people," who owned or rented places near mine, to let them have anything I could spare, at village-grocery prices. There was actual competition for my young carrots, beans, tomatoes, sweet corn,—everything! Even the farmers' wives bought for their boarders, as I put in seed for successive crops, wherever I had a bit of space. The local fashion was to plant once, and let it go at that; wherefore the demand was far larger than I could fill—and continued so.

The extra pin-money from vegetables, flowers and seedlings, more than covered garden expenses, and the value and attractiveness of the property increased yearly.

"Why bother to plant a garden?" "Well, who wouldn't? I found it as good exercise for my brain as for muscles."

It gave me better food, at far less cost than if I had bought it.

It gave me better health than I had had for years. I was then in the late forties, and am now in the healthiest of fifties. Since my gardening began, I've had no doctor's bills, other than for dentist work. And my glowing hope is that at ninety I shall still be gardening. I know nothing more fascinating.

Aldis Dunbar.

Spring Cleaning Toboo

MODERN housekeepers have discarded the old institution of spring cleaning, according to the New York state college of home economics at Cornell University.

The yearly or semi-yearly event when the whole house as well as its

occupants were upset is now being replaced by systematic cleaning which continues the year around. If floors and rugs are cleaned regularly each week or two, furniture and woodwork dusted, walls brushed lightly with a covered broom, and windows and mirrors polished or washed frequently, there will be little opportunity for much dust to collect during the year.

Certain jobs, however, will always fall in the spring. Furs, winter clothing, and blankets must be cleaned and stored, awnings, screens and slip covers for furniture must be taken out and put in good order for the summer, and fireplaces and furnaces should be cleaned of their accumulation of ashes, dust and soot and put in order for fall.

A Good Baked Dessert

Bananas and Rhubarb

THIS recipe is from the Bureau of Home Economics of the U. S. Department of Agriculture:

One quart rhubarb cut in two-inch pieces, three bananas, two tablespoons butter, one-half cup sugar, one-fourth teaspoon salt.

Select tender rhubarb, wash well and cut in two-inch pieces without removing the red skin. Peel and scrape the bananas and split them lengthwise. Grease a shallow baking dish, cover it with a layer of the cut rhubarb, lay the banana halves over the rhubarb, and add the remaining rhubarb. Sprinkle the salt and sugar over the fruit and dot with the butter. Cover and bake in a moderate oven for 15 minutes, or until the fruit is tender. Uncover and continue to cook for one-half hour, or until the syrup has thickened. Serve hot or cold.

Bedroom Comfort

THE bedroom should be arranged for comfort and convenience. Yet many an attractive and luxuriously furnished room lacks those small items that insure comfort and require thought rather than expense. Many a homemaker feels satisfied

when she has provided a good lamp and forgets those smaller features that also spell comfort.

Proper placing of lights is important. A lamp placed at the foot of the bed, preferably at the left, and another beside an easy chair or desk, make a far more comfortable room than the single glaring central light, so often used, which shines directly into the eyes of anyone in bed and gives poor light at dressing tables, desks and other centers requiring concentrated light.

Hanging the mirror conveniently also worth while. Place it so that the light falls on the person in the mirror instead of on the glass itself. A good position is between windows and wall-bracket lights.

Other details which make for room convenience are scrap baskets, clothes closets well equipped with hangers, hat stands and shelves for hats and shoes. In the guest room a towel rack on the door, a folding stool to hold suitcases and a writing table or desk with pens, ink, paper and envelopes are appreciated by visitors.

Diversity, Comfort and Charm in Frocks

No. 6804.—Ladies' apron frock. Cut in four sizes: Small, 34-36; medium, 36-38; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 3 1/2 yards of material 32 inches wide. For contrasting material 1 1/2 yard 32 inches wide and crosswise is required. Price 15c or two for 25c.

No. 6797.—Ladies' dress. Cut in four sizes: Small, 34-36; medium, 36-38; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 4 1/2 yards of 38-inch material. For contrasting material 1 1/2 yard 32 inches wide and crosswise is required. Price 15c or two for 25c.

No. 6795.—Ladies' dress with slender hips. Cut in eight sizes: 38, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. A medium size requires 4 1/2 yards of 38-inch material. To line the bodice requires 1 1/2 yard 18 inches wide, cut crosswise. Price 15c or two for 25c.

No. 6598.—Ladies' smock. Cut in four sizes: Small, 34-36; medium, 36-38; large, 42-44; extra large, 46-48 inches bust measure. A medium size of one material requires four yards and cuts of contrasting material 1/2 yard 36 inches wide is required cut crosswise. Price 15c or two for 25c.

No. 6480.—Girls' dress. Cut in five sizes: 1, 2, 3, 4 and 5 years. A 3-year size requires 1 1/2 yards of material 32 inches wide or wider. To trim bertha edges with plaid will require 1 1/2 yards. To make collar of contrasting material requires 1-3 yard 38 inches wide, cut crosswise. Price 15c or two for 25c.

No. 6807.—Ladies' slip. Cut in four sizes: Small, 34-36; medium, 36-38; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 2 1/2 yards of 38-inch material. To finish the lower edge with lace requires 2 1/2 yards. To finish with bias binding requires 2 1/2 yards 1 1/2 inches wide. Price 15c or two for 25c.

No. 6281.—Ladies' under garment. Cut in four sizes: Small, 34-36; medium, 36-38; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 1/2 yard of all over lace for the bodice, neck and the leg bands and 1 1/2 yards of other material 32 inches wide for the body portions. The shoulder straps will require one yard of ribbon. Price 15c or two for 25c.

No. 6819.—Girls' dress. Cut in four sizes: 2, 4, 6 and 8 years. A 6-year size requires 1 1/2 yards of 32-inch material. For contrasting material 1-3 yard will be required cut crosswise. To finish with bias binding requires 2 1/2 yards 1 1/2 inches wide. Price 15c or two for 25c.

No. 6820.—Ladies' blouse. Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38-inch size requires 2 1/2 yards of material 38 inches wide. For facing of contrasting material 1-6 of a yard 27 inches wide is required cut crosswise. Price 15c or two for 25c.

No. 6806.—Ladies' apron. Cut in four sizes: Small, 34-36; medium, 36-38; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 2 1/2 yards of 36-inch material. To finish with bias binding requires 2 1/2 yards 1 1/2 inches wide. Price 15c or two for 25c.

HOW TO ORDER

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Write today!

for 30 FREE Samples of Cotton Dress Materials

There is still time to enter the 1930 Borden Fabric Dressmaking Contest and to compete for one of the 269 prizes totaling \$4,000. Send today for a complete information and 30 free samples of these beautiful new fast color figured cotton materials. Win while you sew. Your dress may win. No professional experience required. Contest closes May 31st. Borden Fabrics are made by the largest manufacturers of figured cotton fabrics in the world, established 1834. Be sure to give the name of your favorite retailer.

Storage Space

THERE is a woman living who is paid one hundred and fifty dollars every time she plans a closet! Her clients are glad to pay her, too, for she plans a closet so convenient, attractive and efficient that the household affairs revolve more smoothly and systematically because of it. Nowadays architects build closets that are long and shallow, thereby cutting less space from the room and also making possible the use of a longer rod or pole from which clothes are hung. Clothing in such a closet is more readily accessible.

These long, narrow closets may be fitted with four double doors, particularly the wrap closet on the main floor of a large family house. Adjustable or fitted shelves may be placed at one end.

But perhaps you and I are bequeathed with square closets of the past generation, boasting plenty of waste space and dark corners. At first thought, the modern trend in closets seems to mean nothing of us, yet if we stop to consider, we will find some valuable points we can apply to our own state of affairs.

We have had to make over closets after closet, usually, square, and it has been our experience that there is nearly always ample space for shelves at one side and a pole across the other end or through the center. If the closet is small, the pole may be placed diagonally across a corner leaving space at the opposite end for shelves. The rod, incidentally, may be a broomstick or a pipe, painted to match the woodwork. In adult closets, it should be placed high enough to allow the longest garments (and, very likely, the handy mothproof clothes container many of us possess) to swing clear of the floor.

Adjustable Pole

Any housekeeper longs for shelves in the closet on which to put shoes, rubbers and the what-nots that clutter the floor and impede progress on cleaning day. Shelves may be adjustable. Indeed, our storage space may even take the ambitious form of a cupboard at one end of the closet with several large drawers on rollers at the lower half, and smaller drawers above and perhaps a square cupboard at the very top to hold handboxes.

Large drawers of this type are remarkably convenient in men's and boys' rooms for such odd equipment as guns, large games, hip boots, baseball bats, tennis rackets, and many other articles of awkward size which at certain seasons have to be stored somewhere.

Children's closets bear special mention. We find we save ourselves work by providing each child's closet with low hooks, a low pole and a low shelf for shoes and rubbers. To be sure, these may be adjustable and later moved to accommodate the changing reach of the youngsters. A ten-cent towel rack on the back of the closet door is a first-class necktie holder.

Last of all, let us have the closet light if we ourselves must paper or calcimine or paint it a light, harmonizing color this spring. We might add a boldly decorative touch by painting the shelves a bright contrasting tone. A small window or an electric light with convenient switch are desirable when we can arrange for them. Floris Culver Thompson.

Fashion Book Notice

SEND ten cents in silver or stamps for our up-to-date spring and summer 1930 book of fashions, showing color plates, and containing 500 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.

Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Concrete Sidewalks Mean Less "Broom and Mop" Work

Hours of housework—harder work than most men realize—are saved daily by a concrete walk and pavement at the door.

Floors, rugs, in fact the entire house is easier cleaned and stays so with less effort.

Build CONCRETE Walks Yourself!

Build labor-saving concrete walks around your house when other work is not pressing.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

FELS-NAPTHA GETS CLOTHES CLEAN SO QUICKLY

THERE'S no mystery about it. It's the extra help that does it. The extra help of soap and naphtha—two cleaners instead of one.

Working together, those busy helpers wash clothes quickly and safely. They loosen dirt. They dissolve it and wash it away—thoroughly. So thoroughly that when your clothes come off the lines, they're bound to be fresh and sweet and spotless.

You'll find, too, that this extra help does away with hard rubbing. So your hands are in water less, which is one reason why Fels-Naptha helps keep them nice.

Use washing machine or tub; use hot, lukewarm or even cool water; soak or boil the clothes—Fels-Naptha will always give extra help. Try it for easier household cleaning, too. Get a few bars at your grocer's today.

FREE a Fels-Naptha Chipper. Many women who chip Fels-Naptha into machine, tub or basin find it handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha!) just as you need them. Sent free and postpaid on request. Write today. Dept. 7-4-12. Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPHTHA ODOR

FELS-NAPHTHA

This OATMEAL Feed Gives Baby Chicks "A Flying Start"!

From their very first meal, let them have Ful-O-Pep Chick Starter, the balanced ration with the oatmeal base, prepared by The Quaker Oats Company, if you want your baby chicks to grow rapidly and have strong, healthy bodies

A better start, in a race or in poultry raising, gives an advantage which is seldom overcome. Oatmeal—as blended in Quaker Ful-O-Pep Chick Starter—provides wonderful nourishment to give your baby chicks "a flying start." It imparts strength and vitality when they need it most, and promotes a rapid growth that will amaze you.

Ful-O-Pep Chick Starter's other valuable ingredients minimize coccidiosis, anemia and other ills which may cause high mortality. These "lifesavers" include molasses, cod liver oil, cod liver meal, essential proteins and important minerals—all in proper, scientific proportion—all having an important part in the chick's diet—all finely ground and thoroughly mixed so that every mouthful is 100% effective.

Baby chicks eat eagerly of this oatmeal ration which builds better blood, strong, capable organs, sound flesh and broad, deep bodies which denote the heavy consistent layer. After six weeks of this splendid growth-promoting diet, your chicks are ready for Ful-O-Pep Growing Mash. Remember that Quaker Ful-O-Pep Fine Chick Feed should be fed in conjunction with the Starter.

Your Quaker dealer will gladly advise you on your poultry feeding problems. He can show you how to get better laying pullets and finer meat birds for less labor and less money by using Quaker Ful-O-Pep Feeds. You'll find he's a man worth knowing.

Quaker FUL-O-PEP CHICK STARTER

Brooding Chicks by Electricity

By H. C. KNANDEL

IN probably no other agricultural industry have methods of management changed so completely in the last twenty-five years as in poultry keeping. Think back, if you will, a quarter of a century. How many baby chicks were shipped by express or parcel post? The mammoth incubator as it is today was unknown. The colony brooder stove was heated by coal oil and was of poor construction. Battery brooders were practically unknown. Electricity for lighting purposes was considered a luxury even in homes. Now the poultryman incubates and tests his eggs, broods and lights his chicks, maintains high fall and winter egg production, keeps the water from freezing in the laying houses, grinds and mixes his feed all by electricity.

It required years of experimental work on the part of manufacturers to develop an incubator which could be satisfactorily operated by electricity. Now they have it. In recent years, attention has been directed toward the manufacture of electric brooders which will produce results the equal, or better, of coal and oil burning brooders. There are, on the market, two general types—the colony and the battery electric brooder.

One reason why electric brooding of chicks has been held in check is because of the unreliability of electric service in some communities. Chicks require heat during a snow or electrical storm when the current may be interrupted. The poultryman has felt in the past that he could not take the chance of having his chicks chilled.

Ventilation

Another factor in the successful brooding of chicks, and one to which the manufacturers of electric brooders have been compelled to devote study, is that of ventilation. Fresh air must pass through the brooder to meet the requirements of the growing chicks and yet if the cost of electricity is to be kept down an excessive amount of air must be avoided.

In the East the colony electric brooder has not made the progress which has been reported on the Pacific Coast. On the other hand, the battery brooder is used to a considerable extent from coast to coast, but most battery brooders are best operated in a room in which auxiliary heat is installed. Perhaps the colony electric brooder will do well under such conditions.

In a study of electric incubation and brooding by the State College of Washington and a committee on the Relation of Electricity to Agriculture in that state cooperating, some very definite results were obtained applicable to Pacific Coast conditions. Various types of colony electric brooders were used. The following records were recorded: mortality, amount of electricity consumed, cost of electricity per chick for 42 days and the average temperature. Their conclusions are most interesting.

Conclusions

It was observed: (1) That for the successful operation of electric brooders it was necessary to have a reliable source of electric current which was not subject to frequent or long interruptions. (2) An electric brooder should be used only in houses properly insulated and well constructed in order to conserve the heat. (3) Electric brooders with curtains were most economical to operate. (4) As a means of providing proper ventilation it was suggested to place the brooder on a half-inch mesh hardware cloth frame raised two to four inches off the floor. This permitted a constant circulation of air and kept the floor clean, dry and sanitary. (5) The electric brooders maintained an even tem-

perature throughout and required a minimum amount of attention. Unquestionably, the electric brooder will find a place in the field of poultry husbandry. What is needed now is for the manufacturers to get the poultryman's viewpoint, and the two work together. The brooding of early hatched chicks in February, March and April by the electric colony brooder stove with no auxiliary heat is still in the experimental stage. New improvements are constantly to be noted and eventually the poultryman will be able to brood chicks successfully during any part of the year with electricity.

Glass Substitutes

DURING the past seven years many experiment stations have been exposing glass substitutes to very rigid tests. These studies have been made from the two-fold standpoint of actual value in poultry raising and correct installation for years of service.

The tests have proved that these window materials have a very beneficial effect on growth; in preventing leg weakness in baby chicks; on hatchability; increasing egg production and health in the laying flocks. The reason for these beneficial results is found in the fact that reliable glass substitutes let through the ultra-violet rays of sunlight which glass and many other materials keep out.

In their studies, the experiment stations have found that glass substitutes give years of service when proper installations are made. They have also found that these materials, which render such valuable service through the winter weather, wear out if needlessly exposed to summer weather when glass substitutes are not needed.

In bulletins issued by these stations recommendations are made that where the glass substitutes are made in a wire mesh base they should be tacked to frames so hinged that they are always in a vertical position. These frames should be hinged to swing in and to the side, or up under the roof, or they should slide down into a box arrangement in front of or back of the openings. Excellent ventilating conditions are thus provided, and at the same time the glass substitutes are given adequate protection when not in use. Poultry keepers who cannot follow these suggestions should remove the frames during the summer months and store them under cover. G. H.

Gapes

Will you please give me some information on what to do for chickens with the gapes?

I had about one hundred Plymouth Rocks die this way and I would certainly appreciate some advice on what to do for them. B. F. B.

GAPES are caused by a small parasite. This condition was considered of great economic importance a few years ago, but in recent years gapes have not been so serious.

Raising chicks on ground over which fowls have had no access for two or three years has done much to discourage the ravages of these parasites. My suggestion would be to move the house in which your chicks are being brooded to clean range. Lime and harrow the soil well and frequently during the brooding season and move the brooder houses so that the chicks will not be compelled to roam over contaminated ground.

Keeping the chicks indoors for the first six to eight weeks is another sensible way of preventing gape world infestations. By the use of cod-liver oil at the rate of one pound in a hundred pounds of mash, chicks can be successfully raised indoors. H. C. K.

Blood Spots in Eggs

I have some Rhode Island Red hens which are laying well and are in good health, but are in some kind of a neck molt. What causes this and what could be done for it? What causes blood spots in eggs? John P. Reaser.

It is common at this time of the year to notice some individual fowls showing signs of a neck molt. This condition is brought about because of heavy winter egg production or because of a change in management.

Many times when artificial illumination is used during the winter months the farmer is liable to turn the lights off suddenly with the coming of spring. This causes a considerable difference in the number of hours of daylight available to the fowls. A neck molt at this season of the year is not considered serious, since this is the time when fowls usually lay heavily and it is to be reasonably supposed that the birds will soon return to production. Should they not, they should be sold as poultry meat.

Blood spots are the result of a ruptured blood vessel. The little sac which holds the normal egg yolk has what is commonly known as a suture line on which the sac should rupture to emit the egg yolk. If for any reason the sac breaks in another place than along this particular line, a blood vessel is ruptured causing, of course, the blood to collect on the yolk of the egg.

Fowls in heavy production more often produce eggs containing blood spots than those fowls not laying so heavily. There is nothing which you can do for the situation other than to reduce the amount of animal protein in the ration thus retarding egg production. It will, of course, pay you to candle all eggs in order to eliminate those containing blood spots. H. C. K.

Egg Preservative

I am a regular reader of your paper and I wonder if you can advise me where I can get information how to stock up and keep eggs from now till August. Abraham Rubinstein.

THE following method of preserving eggs in water glass has been used with generally good results:

The water-glass preservative is prepared as follows: Mix one and one-half quarts of commercial water glass with 18 quarts of pure water, preferably water that has been boiled. Stir the mixture until the ingredients are thoroughly mixed.

An earthen jar is the most suitable vessel for the mixture, although a light odorless tub may be satisfactory. Two eight-gallon jars are sufficient for 30 dozen eggs using the quantity of solution given above.

After the water-glass solution is thoroughly mixed, pour it into the vessels to be used, being sure that the vessels are absolutely clean. If more water is needed in order to cover the eggs, this may be safely added to the amount of five quarts of additional water to each one and one-half quarts of the original commercial water-glass solution used. H. C. K.

Screen Floor

Can you give me an idea or plan how to put a screen floor in a brooder house? My house is 10x12. A. E. Opeit.

BROODER houses may be equipped with screen floors and it appears that the most satisfactory method of installation consists of placing a heavy grade of hardware cloth on frames. The frames are made of one-by-six inch material two feet wide and four feet long. These frames can be easily removed. It is a good plan to bevel the tops of the boards where the wire is attached so that the droppings cannot collect.

A very successful poultryman in New York state has used wire floors in his brooder houses with very good results. Last year he raised more than 3,000 pullets by this method. H. C. K.

How do you select the mash for your chicks?

FROM the list of feeds available you will choose one feed to rear your chicks. How do you choose it? How do you check its comparative value? There is one feed which you can check easily and accurately—Amco Starting and Growing Mash.

1. The formula is open—a tag on each bag tells what's in it and how much.
2. It has been proved in practice. The words of experience quoted here were unsolicited and are typical of the results secured by Amco feeders. The record of this feed in Pennsylvania has been one of constantly increasing sales.
3. Chicks like this feed, and how they grow on it! The rapid growth and low mortality secured with Amco Starting and Growing Mash makes the rearing cost low.
4. It is a complete ration for young chicks—feed it as an all-mash for the first six weeks and save time and labor.
5. Produces excellent broilers.
6. It is freshly mixed from the best ingredients and is available with or without cod liver oil mixed in.

Try it and you will be pleased with the results, for Amco Starting and Growing Mash does the job as you would expect it to. See your nearest Amco Agent or write to address below.

"Better Growth and Less Mortality"

Gentlemen:
After running tests on broilers on several commercial and home-mixed feeds, I find I obtain better growth and health and less mortality on Amco Starting and Growing Mash.

I always keep 1,200 to 1,500 laying hens. At this date I have 3,500 broilers four weeks old and am now adding 5,000 more.

I also run my entire farm on Amco Feeds.

W. DALLAS KIRLER
Lincoln, Delaware

"Best feeds I have ever fed"

Dear Sirs:

I received 1,700 White Leghorn chicks March 26, 1929. They began to lay when they were 4 months old. In September they laid 14,013, with a feed cost of \$321.01. They were fed no other mash but Amco Starting and Growing Mash until they began to lay, then they were changed to Amco Egg Mash.

As for Amco Poultry Feeds, will say they are the best feeds I have ever fed, and can highly recommend them to all poultrymen.

J. WILLIS GASTON & SON
East Liverpool, Ohio

"Could not get enough of them"

Gentlemen:

I raised 4,000 chicks on Amco Starting and Growing Mash last spring and had the best growth on these chicks that I have had from any mash I have ever used. The cockerels at 8 weeks and 4 days old weighed 13/4 pounds each. The man who bought them could not get enough of them, as his customers liked the plump breasts and wanted more. The pullets at 14 weeks of age were extra well developed. At 4 months and 11 days they were well feathered and heavy, and began laying.

I have recommended this mash to many of my neighbors and all who have tried it are well satisfied.

Experience with Electric Brooders

By R. L. SCHARRING-HAUSEN

WITH the increasing use of electricity in rural districts, the question of using electric brooders has come before poultrymen, who wonder if the ease of handling such brooders does not outweigh the disadvantages which they possess and so I want to discuss the subject from both sides.

Among the good points of electric brooders are the ease of management, as all carrying of coal and ashes is done away with, regulation is easy, temperature control is automatic, and once they are properly adjusted, very little attention need be given them.

Among the bad points, it is known that current furnishes a rather expensive source of heat, and where service is not reliable or is interrupted by bad storms, the poultryman who depends on electric brooders is out of luck and may suffer disastrous losses.

The largest electric equipment I have ever seen gave a capacity of 25,000 chicks. Canopy type brooders were used in a long house, which was also heated by a hot water central heating system; automatic water fountains were in each pen, and a feed and litter carrier was provided. The owner stated that he had had no trouble, and that one good man could take all care of the 25,000 chicks with the exception of cleaning.

Favorable Conditions

This farm obtained current at a very cheap rate, the climate was mild, and the auxiliary heating system gave some measure of protection in case of power interruption; and the owner stated that his plant was satisfactory in every way, as to cost of operation, saving of labor and reliability.

I also know of a plant in the South using electric hovers in colony houses where good results were had. Here the climate was mild, and the current was off during the greater part of the day, coming on when the evening grew chilly, and under these circumstances the system was both satisfactory and economical. On the other hand, I learned of a poultryman using electric brooders in colony houses without other heat in a severe climate, where service was interrupted for two weeks by a heavy sleet and snow storm which broke down the poles, who lost all his chicks. Of course such a disaster would be unusual, but it would have to be reckoned with nevertheless.

Another type of brooder using current for heat is the battery. I have been using such a battery this season for storage purposes and holding pedigreed chicks for the first few weeks, and am very well pleased with it. It is self regulating and the heating feature requires no attention whatever. This battery is in my incubator cellar, which is heated to 70 degrees, and where I can run the temperature higher if necessary. There are also larger chick rooms and battery brooders on the market heated and ventilated by electricity which seem to be very satisfactory.

Relative Costs

As to the cost of such brooders, the canopy or hover type is about that of a good coal brooder. The battery which I have cost about \$70 delivered, and will hold 900 chicks for a few days, or 500 to three weeks. Operating costs of electric brooders vary with the rate for current and the conditions under which they are run, and while I cannot quote costs, I will guess that considering the saving of labor, they are not expensive to operate. My battery is supposed to cost about 60c per day for current, but as it is hooked on a line with other equipment I am not prepared to say what it costs.

Judging from experience and observation, I would say that where canopy or hover type electric brooders

Danger of Infection Among Baby Chicks

Success in raising baby chicks is dependent upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of contaminated drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs and ordinary drinking water often becomes contaminated and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Take the "stitch in time that saves nine." Remember, that in every hatch there is the danger of some infected chicks—danger of diarrhea in some form and other loose bowel and intestinal troubles. Don't let a few chicks infect your entire flock. Give Walko Tablets in all drinking water for the first two weeks and you won't lose one chick where you lost dozens before. These letters prove it:

Mrs. Bradshaw's Remarkable Success in Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 500, Waterloo, Iowa, for their Walko Tablets for use in the drinking water of baby chicks. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chicks are larger and healthier than ever before. I have found this Company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shenandoah, Iowa, writes: "My first incubator chicks when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko Tablets to be used in the drinking water for baby chicks. It's just the only thing to keep the chicks free from disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko Tablets entirely at our risk—postage prepaid—so you can see for yourself what a wonderful remedy it is when used in the drinking water for baby chicks. So you can prove—as thousands have proven—that it will reduce your losses and double, treble, even quadruple your profits. Send 50c for a package of Walko Tablets (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Pioneer National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

Walko Tablets are sold by leading druggists and poultry supply dealers. WALKER REMEDY CO., Dept. 500 Waterloo, Iowa

KERR CHICKS

Demonstrate Their Intensified Laying Inheritance

KERR pullets will lay the extra egg or two that will more than pay the difference in cost between a Kerr chick, with its heavy-laying inheritance, and the cheaper chick with an unknown laying ancestry.

Kerr laying strains are as good as the best. This significant statement is evidenced by the report from the Storrs laying competition. At the end of the seventeenth week, the average egg production per pen was 741 eggs. But, Kerr's pen, of Barred Rocks laid 772 eggs, and Kerr's pen of White Leghorns laid 865 eggs.

Kerr's Lively Chicks are closely related to our heavy producing contest birds.

are used in a long house with a central heating system to take the chill off the air, they are satisfactory and very economical of labor, and that they are all right for colony house use late in the season or in a mild climate.

As for the battery type, which is used in a heated room, this season's experience with the one I have been using leads me to think that they are ideal for holding chicks or for starting chicks for a few weeks which are later to be put in a brooder house.

The rapid development of the battery brooder makes me think that its use is going to revolutionize methods of starting chicks and raising broilers. The battery idea is not yet fully worked out, and while some men have used batteries with excellent results, others have lost money with them.

Range Paralysis

We have six hundred White Leghorns. They look nice, are laying about three hundred and fifty eggs per day.

Every once in a while one of them seems to lose the use of its wings, then lies on its side and sometimes will be that way a couple of months—then dies.

YOUR birds may have a touch of range paralysis, for which I can suggest no remedy, except to remove ailing birds from the flock at once, and maintain good sanitary conditions.

It is also possible that worms may be present, although it is not likely that there would be a heavy infestation with the good production you are getting. I have used capsules with good results for worms. You might examine the intestinal contents of a dead bird for worms, and if you find any present, give a capsule to each of the living ailing birds. It would not be wise to worm the whole flock now, as it might throw them out of production.

Chick Mash

Will you kindly advise me what kind of feed to give little chicks, also what kind of litter to use in brooder house? Some use sand around stove and some use peat moss or something.

Mrs. Chas. F. Miller.

THE chick mash I am using is a formula put out by the New Jersey Experiment Station, which I have mixed at the feed mill. A great many poultrymen use commercial feeds, and you cannot go wrong on any of the well-known brands.

I use peat moss for brooder litter. Some use sand, shavings, or other material. Most of the trouble with litter comes from putting the chicks out without giving them feed. The consequence is that they fill up on indigestible stuff and get sick or die. The next set of Nest Box Notes takes up this subject and I think it will prove interesting to you.

R. L. S.

Swollen Joints

Every now and then a few of my White Rock chickens get swollen knees and sit around a long while before they die. What is the cause and what is the cure? Is this contagious? Are the eggs from the rest of the flock all right for hatching?

H. E. K.

LAMENESS in fowls may be caused by intestinal worms, a good treatment for which is a prepared capsule, which you may be able to buy at your drug store. There is some risk of throwing your flock out of production in using these worm treatments, and I would advise you to slit the intestines of a dead bird and examine the contents for worms before giving any worm treatment.

The symptoms may also be those of gout which may come from an improper ration. If you will tell me what you are feeding, I may be able to give you some help there.

I wouldn't attempt to hatch from the flock unless it is in generally good condition. If the birds are mostly in good shape, I would remove the ailing birds before saving hatching eggs.

R. L. S.

GERMOZONE

The Life-Saver for Chicks

You cannot avoid the disease germs and bacteria that are picked up from the floor and droppings, you cannot avoid contamination from germ-laden little feet, you cannot avoid particles of spoiled or moldy food. But with a single teaspoonful of Germozone to the quart of drinking water three times a week, you can avoid the crop and bowel infection and diarrhoea that the germs and bacteria so surely bring on.

Each year increasing thousands of Germozone users save their chicks from this greatest danger. Leading hatchmen recommend Germozone, many public institutions and experiment stations use it. SAVE YOUR CHICKS. A trial bottle, at our expense, will show you that your big losses can easily be avoided.

Give Germozone if your chicks already are sick. Use it for all sick birds.

At drug, food and hardware dealers and chick hatcheries (one only at a town); or from factory, postage 12c. Bottle 10c. 1/2 lb. \$1.50; gal. \$4.50. \$4.50 textbook on diseases, free.

The Squash's Birthday

By GILBERT S. WATTS

IN the fall of 1928 I gave a friend several fine Blue Hubbard squashes. All had been used but one and this after being forgotten for a time was discovered in perfect condition. Since then it has been kept as a curiosity and gives promise of attaining its second birthday next fall. Of course that is not a record. But with a March snowstorm raging outside as this is being written it does impress one that squashes are a garden product that can and should be enjoyed throughout the six months or longer period during which we northerners are denied the privileges of gardening.

It will be of interest that this squash has been kept on a shelf in a dry cellar containing a heating furnace. Temperatures have varied little and there never has been an excess of moisture, just the conditions squashes like.

To have plenty of winter squashes next fall plant the middle of May in hills about eight by eight feet apart. Protect from the bugs and thin to not more than two strong plants in each hill, first thinning to three or four plants.

Ebenezer (Japanese) Onions

Sets of these may be obtained from a number of seedsmen. If planted early under good culture large, excellent keeping onions will be produced by midsummer. I know of no easier and more certain way to produce a crop of mature onions than from Ebenezer sets.

Spinach for the Dog!

On our way home from a show one Saturday evening last fall my wife remarked, as we passed the market house, "Let's stop and see what they have." And we stopped.

And we saw heaps and heaps of fine vegetables and other good things. And at many stands heaps and heaps of newspapers. We came to some of the most beautiful spinach you ever saw and we bought. And in all its newly washed dripping freshness the market lady wrapped our spinach in a newspaper.

Now newspaper paper is built with intent and design to absorb moisture and how! Arrived home my wife stepped from the car. I handed out the spinach package. The soggy paper disintegrated without notice. The spinach spilled to the floor where it was instantly and thoroughly investigated, trampled and broadcasted at one operation by a curious and joyful pup.

And this is neither comic strip nor fairy story, even if it does have a moral.

Why should the consumer buy produce wrapped in rotten newspapers at the market when he can get it in secure, water-resisting bags at the store? Freshness? Yes, sometimes, and used to be. Today shippers, distributors and retailers know a few things about conserving quality and are learning more. Pennsylvania is a stronghold of the retail farmers' market. Yet day by day the progressive store-keeper's window displays a line of green goods that cuts down on the farmer's lead in respect to freshness and attractiveness. Old newspapers! Where is the store-keeper who formerly used them? He's out.

Earlana Still Earlana

So says a vegetable specialist at a leading experiment station. To quote exactly, "An early tomato variety of good quality and fair yield has been the aim of seedsmen for years. Nothing remarkable has been accomplished as yet. Selected strains of Earlana are still Earlana in quality and appearance. Crosses between Earlana and other varieties, if early, still have the objectionable Earlana character-

istics." After trying at least a dozen improved Earlana I reached the same conclusion and have discontinued the variety for several years.

Avoid "Damping-Off"

Last year a gardener acquaintance could set only two-thirds of his usual acreage of early cabbage because damping-off had made serious inroads in his plant beds. Experiences of this sort are not uncommon and result in disheartening losses. Observation of certain rules usually will eliminate this trouble or at least keep it in close check.

Discard or sterilize soil in which damping-off has occurred previously. Do not crowd the plants; sow thin and thin or transplant to adequate spacings for good air circulation.

Provide sufficient heat for good growth but avoid very high temperatures.

Maintain even, never excessive moisture in the soil, watering principally in the mornings of bright days.

Ventilate freely but do not chill the plants.

Arrange sash or other coverings to admit as much light as possible.

THE MARKET PLACE

By W. R. WHITACRE

HOW much should a 100-pound sack of potatoes weigh? Retailers selling by weight expect 100 pounds of potatoes or close to that. But this past season they claim that many sacks have weighed only 80 to 90 pounds. I doubt whether they ever weighed 100 pounds in spite of the fact that most packs are stamped with "100 pounds when packed."

Shrinkage or loss in weight through evaporation varies with the season and more complaints of short weight are heard in the early part of the winter than with stock packed later in the year. When buyers find that a certain grower's potatoes run short in weight they refuse to pay full price for them.

A number of retail fruit and vegetable stores have protested against the ruling in the recent Container's Act which prohibits the sale of the quarter-peck round basket. They used these baskets to display and to measure fruits and vegetables. Apples, for instance, were displayed and sold from this container, with the dealer keeping the basket.

I personally hope that their pleas are in vain, since many of them use this container to deceive the public. Apples arranged carefully in one of these baskets look very attractive, but it takes only five to eight apples to heap it high. At present they are charging in Philadelphia from 20c to 35c for one of these baskets of apples and that makes medium sized Yorks sell at four cents each and over.

New Jersey and Pennsylvania greens are coming on the market more freely as the season advances. Many consumers as well as growers are not acquainted with the great variety that is available. One day last week the market reports quoted collards, cabbage sprouts, field cress, dandelion, rape, rabe and turnip greens. All of these greens were from the nearby states.

Many market gardeners are finding flowers a profitable side-line. Fuchsias are one crop that works in well with market gardening and which give a good return. A number of Pennsylvania growers located near Philadelphia have been growing them quite intensively and find a ready sale for the plants.

Your baking is bound to be better

Millions of women find sure success with Calumet's Double-Action

This is a message for women who want perfection in their baking every time. We want to show them how they can make such wonderful cakes and quick breads that their families will boast about them to their neighbors. We want to tell them why Calumet—the Double-Acting Baking Powder—brings such remarkable baking success.

Calumet acts twice, not once. The first action takes place in the mixing bowl. This starts the leavening. Then, when you put your cake into the oven, a new, fresh rising swells through your batter, lifts it to the top of the pan and holds it there until the oven heat has done its work. In this way Calumet's Double-Action makes your baking rise beautifully and come out exactly right, time after time—even though you may not be able to regulate your own temperature accurately.

All baking powders are required by law to be made of pure, wholesome ingredients, but not all are alike in their action. Not all will give you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce perfect leavening action—Double-Action.

Try the delightful recipe given here. You will notice how little Calumet it calls for. The usual Calumet proportion, which should be followed for best results, is—one level teaspoon of Calumet to each cup of sifted flour—a worthwhile economy.

Test Calumet's DOUBLE-ACTION this way!

Naturally, when baking, you can't see how Calumet's Double-Action works inside the dough or batter to make it rise. But, by making this simple demonstration with only baking powder and water in a glass, you can see clearly how baking powder acts—and how Calumet acts twice to make your baking better.

Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's first action—the action that takes place in the mixing bowl when you add liquid to your dry ingredients.

After the mixture has entirely stopped rising, stand the glass in a pan of hot water on the stove. In a moment, a second rising will start and continue until the mixture rises to the top of the glass. This is Calumet's second action—the action that takes place in the heat of your oven.

Make this test today. See Calumet's Double-Action which protects your baking from failure.

CALUMET'S DOUBLE ACTION

MAKES BETTER BAKING

Recipe for Vanilla Nut Ice Box Cookies

- | | |
|-----------------------------------|--------------------------|
| 4 cups sifted flour | 1 cup sifted brown sugar |
| 3 teaspoons Calumet Baking Powder | 2 cups granulated sugar |
| 1/4 teaspoon salt | 2 eggs, well beaten |
| 1 cup butter or other shortening | 1 cup nut meats, chopped |
| | 1 tablespoon vanilla |

Sift flour once, measure, add baking powder and salt, and stir again. Cream butter thoroughly, add sugars gradually, and cream well. Add eggs, nuts, and vanilla. Add flour gradually. Shape into 1 1/2 inch balls in diameter. Let stand in ice box over night or until hard enough to slice. Cut into 1/4 inch slices. Bake in hot oven 425° F., 10 minutes. Makes dozen cookies. (All measurements are level.)

The Squash's Birthday

By GILBERT S. WATTS

IN the fall of 1928 I gave a friend several fine Blue Hubbard squashes. All had been used but one and this after being forgotten for a time was discovered in perfect condition. Since then it has been kept as a curiosity and gives promise of attaining its second birthday next fall. Of course that is not a record. But with a March snowstorm raging outside as this is being written it does impress one that squashes are a garden product that can and should be enjoyed throughout the six months or longer period during which we northerners are denied the privileges of gardening.

It will be of interest that this squash has been kept on a shelf in a dry cellar containing a heating furnace. Temperatures have varied little and there never has been an excess of moisture, just the conditions squashes like.

To have plenty of winter squashes next fall plant the middle of May in hills about eight by eight feet apart. Protect from the bugs and thin to not more than two strong plants in each hill, first thinning to three or four plants.

Ebenezer (Japanese) Onions

Sets of these may be obtained from a number of seedsmen. If planted early under good culture large, excellent keeping onions will be produced by midsummer. I know of no easier and more certain way to produce a crop of mature onions than from Ebenezer sets.

Spinach for the Dog!

On our way home from a show one Saturday evening last fall my wife remarked, as we passed the market house, "Let's stop and see what they have." And we stopped.

And we saw heaps and heaps of fine vegetables and other good things. And at many stands heaps and heaps of newspapers. We came to some of the most beautiful spinach you ever saw and we bought. And in all its newly washed dripping freshness the market lady wrapped our spinach in a newspaper.

Now newspaper paper is built with intent and design to absorb moisture and how! Arrived home my wife stepped from the car. I handed out the spinach package. The sopping paper disintegrated without notice. The spinach spilled to the floor where it was instantly and thoroughly investigated, trampled and broadcasted at one operation by a curious and joyful pup.

And this is neither comic strip nor fairy story, even if it does have a moral.

Why should the consumer buy produce wrapped in rotten newspapers at the market when he can get it in secure, water-resisting bags at the store? Freshness? Yes, sometimes, and used to be. Today shippers, distributors and retailers know a few things about conserving quality and are learning more. Pennsylvania is a stronghold of the retail farmers' market. Yet day by day the progressive store-keeper's window displays a line of green goods that cuts down on the farmer's lead in respect to freshness and attractiveness. Old newspapers! Where is the store-keeper who formerly used them? He's out.

Earliana Still Earliana

So says a vegetable specialist at a leading experiment station. To quote exactly, "An early tomato variety of good quality and fair yield has been the aim of seedsmen for years. Nothing remarkable has been accomplished as yet. Selected strains of Earliana are still Earliana in quality and appearance. Crosses between Earliana and other varieties, if early, still have the objectionable Earliana character-

istics." After trying at least a dozen improved Earliana I reached the same conclusion and have discontinued the variety for several years.

Avoid "Damping-Off"

Last year a gardener acquaintance could set only two-thirds of his usual acreage of early cabbage because damping-off had made serious inroads in his plant beds. Experiences of this sort are not uncommon and result in disheartening losses. Conservation of certain rules usually will eliminate this trouble or at least keep it in check.

Discard or sterilize soil in which damping-off has occurred previously. Do not crowd the plants; sow thin and thin or transplant to adequate spacings for good air circulation.

Provide sufficient heat for good growth but avoid very high temperatures.

Maintain even, never excessive moisture in the soil, watering principally in the mornings of bright days. Ventilate freely but do not chill the plants.

"I can turn over half again as many acres on a gallon of this New Mobiloil"

(and the farmer who says so lives in Missouri!)

Down in Missouri they don't take anything on faith. We knew that the New Mobiloil would last longer . . . save power . . . cut fuel costs . . . and reduce repair bills.

But it's only natural for a Missourian to take a manufacturer's enthusiasm with a grain of salt.

So our Missouri friend* made some oil tests on his own. His experience had shown that in buying oil it's not price per gallon that counts, but what it costs per acre covered, day in day out, season after season. He had a good idea of the cost of the oil he had been using, figured on that basis.

A 30-gallon drum of the New Mobiloil,

the New Mobiloil

and five months of close check-up on every kind of tractor work, was more than enough. Then he told his Mobiloil dealer, "This New Mobiloil may cost more a gallon, but that's not what interests me. I can turn over half again as many acres on a gallon of it, use less kerosene, and I haven't had a wrench on that 'mud-hog' since I began using it."

Refer to the complete Mobiloil Chart at your dealer's for the correct grade of the New Mobiloil to use in your car, truck or tractor. It will save you nickels every working day, and dollars by the month.

VACUUM OIL COMPANY
Makers of high quality lubricants for all types of machinery

MAKE THIS CHART YOUR GUIDE

THE correct grades of Gargoyle Mobiloil for engine lubrication of prominent passenger cars, motor trucks, and tractors are specified below. If your car is not listed here, see the complete Chart at your dealer's. Follow winter recommendations when temperatures fall from 32° F. (Freezing) to 0° F. (Zero) and below. Below zero use Gargoyle Mobiloil Arctic (except for Model T, T-1, T-2, use Gargoyle Mobiloil "F").

A NEW 6

AT THE AMAZINGLY LOW PRICE OF

\$835

AND UP F. O. B. FACTORY

- the LOWEST PRICE at which a Six by Dodge Brothers has ever been sold.
- the LOWEST PRICE at which Dodge Brothers have ever offered a closed car.
- the LOWEST PRICE at which a Six with internal-expanding 4-wheel hydraulic brakes ever has been offered.
- the LOWEST PRICE at which you could have a car with a Mono-piece (Steel) Body, the most advanced construction known to the industry.

A NEW 8 IN-LINE

SENSATIONAL IN VALUE

\$1095

- SENSATIONAL VALUE in engineering—with Down-Draft carburetion; both air and oil cleaner; 220.7 cubic inch piston displacement; 4-wheel hydraulic brakes.
- SENSATIONAL VALUE in comfort and luxury—four hydraulic double-acting shock absorbers; low-swung, silent, safe Mono-piece (Steel) Body; pillow-type mohair or broadcloth upholstery; fully adjustable front seat.
- SENSATIONAL VALUE in its typical Dodge Brothers quality and dependability.

DODGE BROTHERS

UPHOLDING EVERY TRADITION OF DODGE DEPENDABILITY

Tests have shown that live stock hauled to market will lose less weight in a smooth-rolling truck.

Balloon tire softness helps to keep trucks rolling over soft ground, muddy roads. Because you can safely travel at higher average speed, you can make more trips per day—or make single trips to town and back in shorter time. These new tires lower costs by extra mileage.

Balloon Tires Goodyear's newest development for Trucks

YOU know what balloon tires have done for passenger cars. Here they are now for trucks — pioneered by Goodyear.

Put them on your trucks — and end the tire troubles due to high speed, long distance operation.

They're great tires for farm trucks, at a price you can afford to pay. Let the nearest Goodyear Truck Tire Service Station Dealer show you how easily the change-over can be made on your present truck. Specify them on new trucks.

More tons are hauled on Goodyear Tires than on any other kind.

Orchard Windfalls

By S. W. FLETCHER

DR. R. D. ANTHONY of State College draws an indictment against a continuous bluegrass sod in the orchard. This grass makes its heaviest growth, and hence its greatest demand on the soil for nitrogen, in early spring, when fruit trees need it most. Other grasses, as timothy and orchard-grass, do not compete with the trees so much. Young tender bluegrass may be 20 per cent protein, as compared with four per cent for timothy; hence its higher demand on soil nitrogen. Only a small percentage of a nitrogenous fertilizer applied in early spring to an orchard in heavy bluegrass sod may reach the tree roots; it is appropriated by the bluegrass. This is why, in both experimental work and in growers' experience, a steadily increasing amount of nitrate is necessary to secure equivalent response in a bluegrass orchard.

This evidence does not rule out bluegrass, which will remain an admirable cover for the orchard, especially on limestone soils; it merely points to the desirability of turning a bluegrass sod frequently, before it becomes very heavy, perhaps every three to five years. This puts organic matter into the soil also.

Succession of Apple Varieties

Peter Boltz, a local market apple grower of Lebanon, has grown many varieties—too many, he now feels—and has come to this conclusion: that the fundamental sorts for him are four—Yellow Transparent, Summer Rambo, Smokehouse and Stayman. To these he would add more limited plantings of the following varieties, which will give a succession during the entire year for a local market trade: Red Astrachan, Duchesse, Wealthy, Grimes, Winter Banana, Delicious, Baldwin, Rome, York, Paragon, also two sweet varieties, Sweet Bough for summer, and Paradise for winter. There is always a limited but lucrative demand for sweet apples at roadside markets. All the varieties on his list would not be suitable in northern Pennsylvania.

Common Storage

John Runk, Huntingdon county, has recently built one of the widest monolithic concrete common storage houses in the state. It is 160 feet long and 51 feet wide. Rarely are such houses built over 40 feet wide. The roof slab ranges in thickness from 11½ inches at the eaves to 9½ inches at the center. Ventilation is secured through doors at each end; there are no ventilators. He stores the apples in bushel baskets piled seven tiers high, not in crates, with satisfactory results until this year. Baldwin and Stayman went on the market from common storage over-ripe this year; the autumn was too warm. To Mr. Runk this seems to indicate the need of supplemental cold storage.

This has been a very poor common storage year, generally, not only because of the warm fall but also because of the very dry season which made the fruit, especially varieties like Baldwin and Stayman, of poor storage quality. The loss from decay has been exceptionally heavy. When rats or mice begin to damage the fruit in his storage, Mr. Runk puts the tractor inside, closes the doors and runs it until the monoxide gas has done its work. He says, "I give my least valuable hired man the job of running it."

Apple Exports and Apple Grades

Our federal representative in European apple markets, Mr. F. A. Motz, reports that Great Britain is thinking of excluding all American apples that are not very strictly graded. This action arises chiefly from the

sad experience they have had with a large quantity of American apples marked "Unclassified." This term means nothing at all, and includes all sorts of grades.

This contemplated action affects Pennsylvania. According to D. M. James, of the Pennsylvania Bureau of Markets, the Shenandoah-Cumberland region, including southern Pennsylvania and adjacent states, exports more apples than New York or Washington. In 1926-1927, 55 per cent of the carlot shipments of Pennsylvania were exported. The proportion has been somewhat less the last three seasons. The 15,000,000 bushels that the United States exports in normal seasons is a very important factor in maintaining fair prices in the domestic markets.

The very common use of the "Unclassified" fraud in New York and Virginia has tended to demoralize the whole standard apple grade movement in the East. Growers have contended that the specifications of the U. S. No. 1 grade are too high, especially in color, hence they have resorted to this subterfuge. In Pennsylvania, however, there has been a steadily increasing use of the U. S. standard grades.

This problem will be considered at a meeting of representatives of the growing industry of the eastern apple states, to be held in Washington, D. C., April 30, at 10:00 a. m., in the Conference Room of the Bieber Building, 14th and B Streets, S. W.

When to Prune Fruit Trees

I NOTICE this question has been asked by several persons. My answer would be, do not prune any of your fruit trees until they are coming out in bud. From that time until the fifteenth of June I consider a very good time to prune. I note some of our large commercial fruit growers say to prune at any time. I am not in favor of winter pruning. When you cut off a limb during the dormant season the cut will get dry and turn dark. The bark around the edge of the wound will get dry and die from one-eighth to one-fourth inch and it takes a whole season to heal that wound over. By pruning when the sap is up you will heal that wound over the first season.

Never use a saw for pruning, unless you have some very large limbs. Take the knife and smooth over the wound, as a saw cut will hold water and cause a rotten spot. A wound of any size should be covered over with grafting wax or paraffin. I consider paint a poison to a wound. It injures the edge of the bark and keeps the wound from making an early start to heal over. You should make a close clean cut in cutting off a limb. In using a clipper you generally leave a stub which will disfigure the tree and is hard to heal over. H. S. B.

Winter Injury

I am sending a box of twigs taken from trees that were set in 1928. They did not make much growth this past year due to the dry weather. I suppose. Last fall they looked all right as far as I could see. But on looking them over yesterday fully 85 per cent of them are dead, down to about a foot from the ground. W. M. B.

UNDoubtedly this is winter injury, which has been quite common this year. The twigs show no evidence of injurious insects or diseases. If the bark is green on the main roots and for six or more inches above the bud or graft, it will pay to let the trees remain. Shoots probably will break from below the injured top. I would trim the dead top to a whip and use it as a stake to support the single new shoot that is selected to renew the trunk. Cut it off next spring. S. W. F.

PLAN WELL—and NEW YORK CENTRAL LINES will help you make more money!

New York Central Lines bring America's greatest industrial centers and cities "close" to your farm. This railroad system serves a market that includes half the people living in the United States!

Cash in on your advantage! Now's the time to insure maximum profit on your investment and your work. Plan your crop production carefully—cautiously... good seed—well fertilized—carefully grown. With high grade products properly packed you will be in a position to use the superior transportation service offered by the New York Central Lines to the best markets in the world. Plan now to get a satisfactory return for what you produce.

No other application so penetrating—so healing

MAKE no mistake about this—a similar name or a similar package can never deliver BAG BALM results. The secret of this wonderful healing base compound of an effective penetrating oil—produced only by our own exclusive process. This oil is vigorously antiseptic. It penetrates deeply and rapidly, carrying the potencies of the potent medicated ointment. For BAG BALM results in treating troubles of udder and teats—or for any farm healing—insist on BAG BALM by name.

Avoid imitations

They cannot produce BAG BALM results. Some ointments, containing Formalin, are actually harmful when used on delicate tissues.

A double-action healer

This great combination of penetrating oil and healing ointment is primarily designed for use on the delicate tissues of udder and teats. Cuts, chaps, cracked teats and common hurts are usually healed between milkings. For inflammation, Caked Bag, Bunches, Cow Pox and other troublesome ills, BAG BALM brings quick effective relief. Clean, pleasant to use—cannot taint the milk.

Large 10-ounce package, 60¢ at feed, drug, hardware and general stores. Mailed postpaid if not obtainable locally. Hundreds of healing uses on the farm. Write for valuable FREE Cow Book. 32-pages, illustrated.

DAYLIGHT SAVING for every DAIRYMAN

The New Empire Milker Saves
Hours Every Week. Only \$8.50
A MONTH

Here is a new kind of daylight saving. No setting back of the sun—no tinkering with your timepieces. The Empire Milker will save you hours every week—hours formerly spent with your cows—for profitable work in your fields and for more leisure with your family.

The Empire is a thoroughly dependable milker, now used by thousands, all over the country. Patented non-stretchable teat cup linings, and a pulsator that milks right every day. A size for every dairy. Small deposit and terms as low as \$8.50 a month make purchase easy. Write for full information.

EMPIRE MILKING MACHINE CO.

Farm & Dairy

By L. W. LIGHTY

"I WOULD like to know what it costs to keep a cow. I find it too difficult to try to keep an account that really tells me anything. I have five cows and the amount I drew from the milk station for 1929 was \$610. We used the milk and cream we wanted in the family. Can you tell me what it costs to keep a cow a year?"

A lead pencil diligently used would have told this man better than I can. Records before me from different parts of the country indicate that it cost from \$110 to over \$200 to keep a cow a year. But on a well conducted farm a cow may be fed a year for about \$75. I mean where you grow a lot of grain, have clover hay and possibly some alfalfa and plenty of pasture in the summer. All this reduces the cost of feeding the cow. If this estimate is approximately correct to feed the five cows would have cost \$375. It may be fair or it may not to say that the manure and the calves paid all the other costs save the labor.

With these estimates in mind we find the inquirer had \$235 for his labor, which is almost \$20 per month. He says he thinks he did well, and so do I, because many have done much worse.

Another inquirer, apparently new on the farm, says he bought two cows fresh two months ago and he has been feeding them all they will eat, but of late they eat poorly and have dropped in milk flow.

This man doubtless overfed the cows and they are cloyed. No animal will do well when cloyed. The successful feeder knows that cows, young stock, hogs or poultry must be fed so they will want just a little more but not much. They must come hungry for the next meal. That is the art of feeding and it is acquired only by careful practice.

Something About Hog Feeding

We might presume that every farmer knows how to feed hogs but we presume too much. How frequently have we seen some one shoveling the corn into a dirty and muddy pen. The hog is not a dainty eater and we might think that is all right, but it is all wrong. The hog that may eat off a clean platter has health advantages over the one that has to "root hog or die" in the mud and filth to get the feed.

Under careful observations it was learned that hogs fed on a clean platform produced 10.6 pounds of pork from a bushel of corn, while those fed in the mud of a pen produced nine pounds of pork from a bushel of corn. In feeding 500 bushels of corn the clean platform method would net you over \$80, enough almost to build a mahogany platform. But any hard wood is all sufficient and need not cost above two to three dollars a hog and will last a number of years.

Feeding Wheat

Wheat feeding questions did not reach me for some time, but since wheat has come below the dollar and rye and corn are above the dollar several parties ask about feeding wheat. One inquirer says he can buy 60 pounds of wheat for 96c, while he has to pay \$1.10 for 56 pounds of corn. Wheat is an excellent feed for pigs and poultry with some corn. But wheat lacks palatability, as any one may know who has placed corn and wheat before the animals at the same time. Invariably under my observation the corn was taken first.

I have fed considerable wheat to the cows and young stock. As long as it constituted only a small part of the grain ration, possibly a fifth, it seemed satisfactory, but if I used it as liberally as I used the corn when abundant it was unsatisfactory for the cows and growing stock. I recall some experiment station work that also indicated the same results as noted in my feeding.

Cut 4 months
off your milking
calendar—and
still have
your milk!

WITH a Universal Natural Milker, you can milk your cows in from one-third to one-half less time than required by hand—equal to at least four months' milking time saved for other work or for more leisure in which to enjoy life. Furthermore, with a Universal you can do a better job of milking than is possible even under most ideal hand-milking conditions. You get all the milk, and get cleaner milk. There is no other milker like the

Universal natural Milker

Universals are used daily by more than 40,000 farmers, including many foremost certified dairymen. These users selected the Universal above all other milkers because of its unusual milking action—and its exceptional efficiency—the result of exclusive patented features.

The improved Universal pulsator and test cup (the most important parts of any milker) produce a soothing alternating action (milking two tests while the other two are being massaged), and operate on low vacuum (suction). That is why cows give down their milk readily to this natural milker which "milk" like the calf.

If you are still milking by hand, let us tell you more about the Universal. You are paying for one, say way—in extra time and labor—so why not get the full benefit of it?

Dept. F, Box 356, Marietta, Ohio

Potter County Agriculture Rises to the Occasion

(Continued from page 8.)

During the past ten years have spent more than \$750,000 for land lime. Their inventory of livestock and farm machinery stands now just about \$3,000,000 higher than at the beginning of that period. In order to make their barns and premises qualify for the New York City Board of Milk Inspection, the dairymen of Potter county spent just a little more than \$800,000 during the past three years.

"Five hundred and fifty-five farmers have purchased \$27,750 worth of radios. Twelve hundred and fifty farmers have purchased \$1,293,750 worth of automobiles, \$225,200 worth of trucks, and \$197,000 worth of tractors. The installation of water systems, heating plants, and lighting plants in farm homes in Potter county has increased more than 300 per cent and represents an expenditure of over \$100,000.

"Summing up these expenditures the farming industry has paid approximately \$6,493,700 for land improvement, equipment, livestock and necessary conveniences. It has provided the living for the owners and their families and paid for the necessary up-keep of the buildings and equipment.

Record Keeping

"Are those evidences of financial gain and development sufficient to justify your unqualified support? Do each of you value the investment that you have in the enterprises in this county? If so, then let's make them bigger, better and more efficient.

"Production record keeping must be expanded to more farms. More herds must be in cost-testing associations. We must rapidly increase the number of high producing pure-breds. We have increased the average milk production per cow more than 60 per cent in 12 years. We must make an equal increase in the next five years if we are to meet the competition which we are facing.

"We must develop an active organization to establish and enforce standards of grades for Potter county potatoes. High quality potatoes are grown in Potter county. A growers' organization with highly graded stock will bring competitive buyers and a premium price. Such an organization is also necessary to prevent ambitious commercial organizations from exploiting undesirable sources of seed potatoes.

Needs Advertising

"Potter county products and Potter county advantages must be advertised, and only an active county-wide organization can properly do that job.

"Here is an industry that is rapidly increasing its annual net financial returns under a definitely planned program of development. That increased financial return is finding its way to every business place in the county. Is it worth while for you merchants and professional men to encourage more farmers to take up those improvement projects? Are you farmers who have been using these proven methods sufficiently convinced of their value to interest your neighbors in using them? Has this adopted program of development shown sufficient results to inspire the other public agencies to subscribe to its principles and direct their efforts toward its completion?

"If I have been able to convey one thought, please remember this: two pairs of dragging feet can check the speed of a coasting sled more than all the hilarity and enthusiasm of a whole crowd can possibly overcome.

"The future of Potter county remains a challenge to our faith, the past a record of our efforts, but the present commands unity of action on principles that are proved."

FASTER THAN MEN CAN MILK! NEW RAPID-FLO FILTER DISK

QUIT WORK
ON TIME

SHIP CLEAN MILK DAILY

superiority of Rapid-Flo, very likely your neighbors have. Let them tell you how good it is, how consistently, swiftly, efficiently it performs its daily task.

EVEN if you use milking machines, Rapid-Flo Disks will filter the milk faster than the machines can collect it. Your milk filtering problem is permanently solved when you adopt Rapid-Flo, the fastest efficient filter disk.

Thousands of dairymen the country over now use Rapid-Flo Filter Disks, saving their time, yet filtering every can of milk they ship. If you have not yet discovered the

Rapid-Flo gets all the dirt in less than half the time. This advanced disk established an average period of less than 5 minutes to filter a 40-quart can of milk during extensive tests under actual farm conditions. Made of high-grade hospital cotton, under the same rigid sanitary conditions as the world-famous Johnson & Johnson surgical dressings and hospital supplies.

THE COW HERSELF REGULATES THE SUCTION

WITH the Perfection Automatic Milker, the cow herself regulates the suction by the way she gives down her milk.

No two cows milk exactly alike. The Perfection Automatic Milker was designed with this basic fact in mind. On a hard milking cow, the suction is increased... in shorter sucks. If a cow is an easy milker, the suction is reduced but the sucks are longer. No cow is subjected to more suction than is just necessary to draw the milk.

This automatic adjustment of the suction by the cow herself appeals to discriminating farmers and dairymen. It is an exclusive Perfection feature.

Perfection Manufacturing Company
2170 E. Hennepin Ave., Minneapolis, Minn.

THE BETTER THE LUBRICANT--- THE BETTER THE TRACTOR WILL DO ITS JOB

In all fairness to the tractor manufacturer--and to yourself--you can't expect the motor to keep up to a high pitch of efficiency if you don't give it fair and square treatment!

There's one particular grade of AMOCO TRACTOR OIL made expressly for the very tractor you are operating. It's an oil that will provide complete and thorough lubrication on the hardest, hottest day's work--an oil that will stand up longer than any oil you've ever used before. If you don't know the right grade, consult the AMOCO Lubrication Chart at your nearest dealer or drop us a line, telling make and model of tractor and we'll "prescribe" for you!

GOATS

Registered Swiss & Nubians, from heavy milking thoroughbreds. Big Bucks and does; jacks, rams, herds. **Lloyd B. Goldsborough**, R. 2, Minton, Pa.

Readers' Views

Experience with Moles

In the edition of Pennsylvania Farmer of March 8th Mrs. R. M. complains that moles or ground mice destroy the plants in her cold frames. She says that she has tried poison but they will not touch it. These pests are indeed a problem. A mole will not touch anything that is not alive. Moles live mostly on angle worms. Meadow mice do not dig runs for themselves, but follow the moles, so that if you put poison into the runs you can poison them. But they do not do much harm to hotbed plants, with the exception of cantaloupes or watermelons if you raise them under glass. The only way to keep moles out of cold frames is to use closely-woven wire. If the frame is small, say eight or eight sashes, it is best to dig out the ground say 18 inches below the surface, put your wire flat in the ground and fill the hot manure on top. It must be heavy wire; light mosquito netting will not last more than one or two seasons. But I have some heavy iron wire that I put under ground ten years ago and find still serviceable.

Watches His Step

If the cold frame yard is large it will pay to dig a trench around it—say ten inches deep—and put a strip of wire perpendicularly under ground. When the beds have been made, and most of them are by this time, you can drive the moles away by pushing a stick the size of a broom handle to the bottom of the run and pour pine or coal tar into the hole.

A mole does not like to soil his feet and will avoid a run he thinks objectionable. Even blackstrap molasses will drive him away, and I have been told that he turns up his nose at the smell of synthetic camphor balls. Of this I am not certain, since I always used tar; it is worth trying.

I have often read that moles will not pass a place where castor beans are growing, but I am doubtful about it, since I did see a mole run within a couple of feet of a castor bean plant. It is hardly worth trying the experiment for the moles do most of their damage in early spring and, since the castor bean is an annual, the top soil is dry and warm when it has developed a root system large enough to influence the smell of the ground. By that time the moles have followed the worms to deeper parts of the soil and, except after heavy rains, their runs do not show on the surface. It would therefore not be worth while to plant a castor bean hedge around a hotbed yard.

Working Hours

One thing can be said about the moles, they seem to have a perfectly organized union established among themselves. I have not paid attention enough to the subject to find out of how many hours their working day consists but I am certain they all conform strictly to rules. You will always find them very busy from four a. m. to eight a. m. Then follows a night- or rather day-shift. This lasts till about ten a. m. Then work commences again and lasts till 12 m. I have not observed them close enough to know how they divide the other part of the day.

Of one thing I am certain they are a close corporation, like the railroads, and have always stuck to standard time. Daylight saving has never appeared to them, perhaps because there is no daylight to save where they work. How they are able to measure the time when the sunlight does not penetrate the ground and when their eyes are so poorly developed that they could not perceive it if it did, is something that has always puzzled me. I must say, too, that I have always admired them, for though they possess not as many laws as we people who live above the ground, yet they strictly observe those they have.

Of course, it is possible to catch

Women Drivers

NOTICED in the Pennsylvania Farmer that S. W. does not like the women car drivers. I have driven for 12 years, was car agent for some time. I never killed or crippled any one, but always take my share of the road.

I can drive where any man can drive a car. I always put my own tires on. I can repair my own engine. It just acts kind of funny. I believe I could repair the car better than S. W. could. As to speeding, S. W., don't sleep on the highway. Step on the gas, but watch your speedometer. A cop never bothers me one bit. I believe S. W. would not find fault with me. He could get to smile once in a while at a lady. Then he would cheer up. If he lingers long enough it may be we will have women cops in the future. **Elsie Shams**, Lycoming county, Pa.

To Boss a Bull

TAKE a rawhide about 18 inches long, braid six inches, tie to a stick two feet long. When your bull gets to be six months old use this lash once a day. Talk to him, make him obey, let him know that you are his master. When you let him out always have the lash in your hand. He will not turn on his master. **D. R. Brensinger**, Schuylkill county, Pa.

Dope for Crows

I HAVE always had trouble with crows taking up corn in the spring. Some years my corn was badly damaged in this way and even almost ruined if the field were located near the woodland.

Last year my nearest neighbor and I both procured a preparation made to keep crows off and applied it to our seed corn before planting.

My neighbor planted a few days before I did. He reported that the crows went to his corn field and took up a few hills, only one or two hills in a place. They left his field and did not bother it any more. They came to my field and sampled a few hills, found it not to their liking and left it, no doubt to search for corn with a more agreeable flavor.

Other corn fields in the community were pretty badly damaged by the depredations of crows. I had always before trusted to catching a crow in a steel trap and scaring them away in that way, but often there was much damage done before I could catch the crow. **A. J. Legg**, Nicholas county, W. Va.

Keeps Axe on Handle

It is always annoying and often dangerous to have the axe fly off the handle while it is being used. During dry spells the handle gets loose and before one is aware of it off flies the axe.

I worked the left glove of a new \$1.50 pair of gauntlet protectors to shreds one afternoon. The axe persisted in coming loose and I rammed the handle so hard against the butt end of a post repeatedly that the end of the handle turned back and splintered. The shattered end cost the loss of the glove.

I know better now. With a center punch, a brace and bit for boring through metal and a tiny wooden peg, all loose axes have come to be a thing of the past. A tiny hole will answer the purpose during the life of the axe and will be ready to hold any number of handles that may be required. **Robert I. Weigley**, Lebanon county, Pa.

Assure yourself of that extra \$20 on 20 cows it means \$400 more

DON'T bank too much on fresh pastures. Cow profits are not made in one or two months but over the full milking period. Invest now in late Summer, Fall and Winter milk. The extra milk in the pail means \$20 per cow for the season. And that extra milk comes from full feeding.

Sack-of-Silage supplements early pasture—and gives it a better chance to last through the hot summer months. It's sweet, clean and adds just what the grass lacks—helping you get that extra milk. Better herd health, better profits. Write today for our cow book that tells the complete story.

JOHN W. Eshelman & SONS
(ESTABLISHED 1842)
LANCASTER, PA.

Since 1842 four generations of the Eshelman family have been in the feed business. Located in Lancaster County, one of the richest farming counties of the country, the men who make Eshelman Feed for you are most of them farm-raised. They bring a knowledge, an interest, a pride to their work—which produces better feed.

Eshelman
GUARANTEED FEED

for cows, calves, steers, hogs, horses, pigeons and poultry

Eshelman
LANCASTER 20 DAIRY FEED

An efficient milk producer carefully built and balanced. A complete ration when fed with average grade roughage, such as good mixed hay.

Eshelman
CHICK STARTER

Suits exactly the baby chick's delicate digestive organs. Easily assimilated. Full of life-giving vigor.

Eshelman
GROWING MASH

Should be fed from the time chicks are six weeks old to maturity. Meets every need of growing chicks. Feed dry—in self-feeders.

There is an Eshelman Guaranteed Feed to meet every feeding requirement of live-stock and poultry—backed by 87 years' experience—made of only the finest materials—economical.

THE YOUNG PEOPLE

Why I Am Staying with My Dad

Won't Desert the Colors
First Prize

I AM a farmer boy, seventeen years of age, and I am going to try to tell you why I am staying on the farm.

We have fifty acres in Western Pennsylvania and we grow mostly fruit and truck for market. In the first place, I like farm work. I have my own team and do the plowing and other team work. Dad just tells me what to do and then does not interfere. He also tells me not to work too hard.

I get all I can eat, all the good clothes I need and lots of time for fun and play. I never need to ask Dad for spending money for he always sees that I have plenty. My bank account is slowly climbing, too.

I think a man can make as much money farming as he can in any other work; that is, if he knows how

as much as he wants; go when he feels like it and come back when he gets ready.

Of course, when the boy's pig becomes his father's hog and his colt becomes his father's horse, that makes the boy feel like wishing for something more than the farm.

When fall comes and the crop is gathered and stored away for the winter's use and the ground is white with snow, the farmer sits by the warm stove enjoying what he worked so hard for last summer. The man in the city must go to work, rain or shine, and whether he feels like it or not.

No city life for me!
West Virginia. Everett Craddock.

Greatest Business in the World
Third Prize

I BELIEVE that a boy can have a better time and be happier at home in the country than anywhere else. If a boy stays with his parents and does what he can to make them happy and to make his home a pleasant one to live in, he is sure to be a happy boy and his reward is certain.

Agriculture is the greatest business in the world and I want to help Dad make the farm produce bigger crops by learning better ways of farming as I go through school.

The farm has many inducements and advantages for me. I have splendid parents, a good place to sleep and three good meals a day. If I get sick I am well cared for and among my own people. Many boys who left the farm are today walking the streets looking for work with no prospect for the future.

So you see how it is. Dad and the farm need me and I need the farm and Dad—so I've decided to stay.
West Virginia. Victor Rinehart.

Picked Paragraphs

I DON'T know how other people are but I like to eat at my mother's table better than at some one else's. If every boy knows what is best for him he will stay with his Dad.
Hershel H. Gardner.

His Own Boss
Second Prize

I HAVE often heard that a farmer is the only independent man in the world and I believe it. I live on a small farm back in the hills of West Virginia, out of sight of everything but what can be seen in the valley. Of course that couldn't be much. Sometimes an airplane can be seen floating across the blue on its solitary way.

The farm sometimes seems a discouraging, unhappy place, but in thinking over the matter it is the only place for me to live. The farmer raises nearly everything that he needs—his labor is about all that it costs him. When he gets up from the table he knows where the next meal is coming from and doesn't have to dig down in his pocket to pay the grocer. He can eat when he pleases.

WHEN THE PET LAMB GREW UP

GRAND-DAD LOST HIS RHEUMATISM-----AND HOW?

Second Prize
B. Butcher, West Virginia

WHEN PET LAMB GREW UP

First Prize
Mercy Clark, Pennsylvania

Read About New Contests

Dear Boys and Girls:

ABOUT the hardest job the Young People's Editor has is to find space to print all the really good letters and cartoons which find their way to this desk. There really isn't anything we can do about it unless the Editors get big hearts and give us two pages instead of one. You might write a letter and tell them how you feel about that.

This week we read why Leonard Koedel, Everett Craddock, Victor Rinehart and some others are going to stay on the farm. First and second prize cartoons show Mercy Clark's and B. Butcher's ideas of what happened "When the Pet Lamb Grew Up." Next week there will be more cartoons, three prize letters on "Why I Am Leaving the Farm" and "What Manners Mean to Me." Don't miss reading these.

Any reader of the Young People's Page may enter the contests which are announced from time to time. Ten fine prizes will be given for the best letters on the following subjects—

1. Why I Want to Go to School.
2. Why I Don't Want to Go to School.
3. Cartoons—"The Last Day of School."

All letters must be written with ink. Use white, unruled paper and India or black ink for the cartoons. Give your name, address and age when submitting letter. Contests close April 18th.

Send all letters to Contest Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

Young People's Editor.

This year Dad is going to give me some ground and I am going to plant potatoes and see if I can't raise better potatoes than Dad—so why should I leave the farm? James Hampton.

I am now living in the city but wish I were back on the farm. If my Dad were living that is where I would be. It is the best place for a boy. He can hunt, fish and swim without anyone to stop him. He can have all the pets that he wishes and take a horse-back ride after the cows every day. In town you must go to the store

for milk and then it doesn't taste "Old Molly's." When I get through school my mother and I are going back to the farm. Cecil Danley.

If I stay at home I can have a calf but if I leave I will have nothing. Junior May.

A thousand or more school children and other spectators looked on.

2. New York City.—Little Mary White, 5, with some of the prize rhododendrons at the 17th International Flower Show at the Grand Central Palace.

3. While the average motorist would be more inclined to stuff his ears with cotton to silence fuel knocks in his engine, Uncle Sam's engineers at the Bureau of Standards in Washington pursue a different course and patiently

listen to them with a stethoscope in their tests to secure a standard of comparison for various motor fuels. The tests are being made by a cooperative committee of engineers representing the automotive and petroleum industries.

4. An especially posed and approved portrait study of Sir Ronald Lindsay, distinguished English diplomat, who has recently arrived in Washington to assume his duties as British Ambassador.

5. Chicago.—The first picture of the new trans-neptunian planet discovered by the Lowell

Observatory, obtained by Professor George Van Biebroeck of Yerkes Observatory of the University of Chicago at Williams Bay. The planet is indicated by the arrow. To the right is the nearby star Delta Geminorum, which is easily visible to the naked eye. The halo surrounding the star Delta was caused by reflection of its light on the backside of the plate.

The light of the planet is twenty-five thousand times fainter than that of the star Delta. This picture was obtained with the 24-inch reflector and is from a 30 times enlargement.

6. Lawrence, Kansas.—Photo shows to left of center F. L. Hunt, piano tuner, with his collection of structures (many of them made of spoons) for the comfort and well-being of birds.

Fence for bigger PROFITS

PAGE Fence has helped thousands of farmers to earn more per acre. Crops can be systematically rotated—fields can be pastured—livestock can be fattened on food and grain that would ordinarily be wasted. Long life makes PAGE Fence the most economical fence obtainable. It costs less because it lasts longer. Ask your dealer to show you the style you need.

The Story of Woodbine Farm

By W. D. ZINN

(Continued from Last Week.)

I NEVER met Prof. Latta, who was Director of Institutes during the two years I was in Indiana, but I have always felt very kindly toward him for the interest he took in my work. If a hard trip was to be made I always had a kind letter from him telling me at what hotels I should stop. At one time he wrote, "I am sending you to They are all Germans there and I hope you will be able to interest them." I arrived at nine o'clock a. m. The hall was already full of farmers. Again I was the only speaker. I spoke twice before noon and twice in the afternoon. When I was closing my last talk in the afternoon I happened to look at my watch and saw that it was four o'clock. "I beg your pardon, friends," I said, "You people are dairymen and it is now milking time." An old farmer looked up and said, "Oh! We are not tired. If you are not too tired we would like for you to stay another hour." I could not get away and so I stayed until five and talked with them.

Ohio a Leader

Of the nine states in which I have done institute work, Ohio, under the direction of the late F. L. Allen, has been the best organized and the farmers take the most interest. The institutes continue for two days, and five sessions are held, making twenty sessions during the week. I was out one week when our average attendance was three hundred and seventy-five people for the fifteen sessions. At Smithville, Wayne county, we had an average attendance of 580 people at the five sessions and at Loudonville, Ashland county, we had an average attendance of 480 at the five sessions. Institutes have been held for more than forty years in Ohio, and yet the interest is as good as it was twenty years ago, or better. The state holds 352 state-aid institutes each year and besides these there were over 400 independent institutes held last year.

It was my privilege some years ago to spend four weeks in the bluegrass region of Kentucky in institute work. The meetings were poorly attended in many places. The Lord has done so much for these people that they do not feel that it is worth while for them to know so much about soil improvement, crop rotation, etc. However, many of these farms are being well managed, and the farmers are prosperous.

It was my pleasure to visit the state of New Jersey two winters in succession, visiting each of the twenty-three counties. The late Franklin Dye was Secretary of the Board of Agriculture, and had charge of the institute work of the state. While in the state I had the pleasure of sitting at the feet of the late Dr. E. B. Vorhees, and learned many lessons about soils, fertilizer and lime from him. Dr. Vorhees ranked high as a chemist and as an authority on these subjects. If I have been helpful at all to my fellow farmers it is due largely to the fellowship I have had with such men as Dr. Vorhees, Dr. Charles E. Thorne, Professor Alfred Vivian, Dr. Cyril G. Hopkins, Mr. Alva Agee, Professor T. C. Atkeson, Dr. H. P. Miller, Mr. T. B. Terry, Dr. W. I. Chamberlain and Dr. Firman E. Bear.

The Sunny South

While traveling in West Virginia in institute work I was favored by having as my co-laborer the late Edward Van Alstyne of New York, and our friendship for each other grew very warm. Later Mr. Van Alstyne became Director of Institutes in

YOU CAN RIDE TO PROFIT, FASTER THAN YOU CAN WALK

How the Centaur does the work of man and team

The greater power of the improved Centaur tractor means that it does all work better and faster. You can plow a full 12-inch furrow, disc deeper, harrow cleaner, cultivate with single or double row cultivators, do all operations, faster, cleaner, better while you ride. Tools are available for all tillage work. Centaur has taken the small farmer off his feet and put him on the seat—you feel like working, there's none of that afternoon tired feeling. You do more with the Centaur as it carries you over the fields doing the work of man and team at any speed from 1 to 3 1/2 miles per hour.

If you are running a small farm, an orchard or vineyard, send the coupon for more information.

New York and invited his West Virginia friends to do institute work in the state. I recall having spent the part of a certain winter in Virginia in institute work. Up to the end of January, I had seen no snow but little frost, most of my work being in the southern part of the state. On the morning of January 6th I took a sleeper for New York. I saw the state for New York. I saw the capital in Richmond, and people were sitting around the grounds enjoying the beautiful sunshine.

Not a Joke

I took a sleeper at Richmond that led me into New York City at six o'clock in the morning, but just a little too late to catch the train that would have taken me to the St. Lawrence River, in the northern part of the state. At six o'clock that evening I took a sleeper for my destination, arriving at six a. m. the next day where I found the thermometer at 25 degrees below zero. It was quite a change, but I lived through it and spent, at that time, six weeks in the state.

This was in the days when every hotel had a saloon in its lobby. Many were the nights when I was forced to sit and hear a great variety of stories, some interesting, others distastefully vulgar and profane, told by those who stood by the bar and drank. It has been a pleasure in recent years to stop at hotels and see and hear some of these things. The institutes in New York at that time ranked possibly second to Ohio. The entire time was taken up with lectures and discussions. No time was given for entertainment. The speakers in the evening gave nothing but practical talks, and only those attended who wanted to know more about farming. Aside from my own state, there is no state I have covered so thoroughly as Virginia. For years the railroads of the state furnished the trains and equipped them. The Department of Agriculture furnished the speakers. These trains covered every mile of railroad in the state. Hon. G. W. Koiner was the commissioner, and a very agreeable task-master did he prove to be.

No Place Like Ohio

Institute speakers are often very good story tellers. One such was J. F. Gordon, of Ohio. He had a story that he sometimes told of a boy who was passing a church in a city in Ohio, and hearing singing on the inside went in, taking his seat near the door. This was a revival meeting, and the boy became interested. He went up closer each night toward the pulpit. Saturday night came, and the boy was on the front seat, and the preacher after speaking of the great revival they had enjoyed said, "All who want to go to Heaven stand up." All arose except the boy. Then the preacher said, "All who want to go to hell stand up." The boy still remained seated.

Turning to the boy, the preacher said, "You do not seem to want to go anywhere, please explain." The boy arose and said, "I do not want to go either place, because Ohio is good enough for me."

Mr. Gordon speaking on one of these agricultural trains in Virginia was telling this story to an audience of colored people. When he said, "All who want to go to Heaven stand up," every one in the car stood up. Mr. Gordon told his audience to be seated and went on with his speech, not attempting to finish the story.

The colored people are noted for their responsiveness to the speaker. On one occasion I was speaking of soil improvement to a crowd of colored people, and when I denounced the practices of leaving the land bare through the winter, and of the one-crop rotation, a number of darkies in the crowd continued to exclaim, "That's right, Boss, give it to 'em; That's right, Boss, give it to 'em; That's right, Boss, give it to 'em."

(To be continued.)

THE CASE-OSBORNE mower—popular with farmers for many generations—has the steady power and drive to slash right through the toughest going and keep it up indefinitely.

The secret of this unusual ability is the internal gear type of drive which insures steadier, more positive power because at least two and one-half teeth on the counter shaft pinion are in mesh with the drive gear all the time. This is impossible with an external gear.

Farmer's Business Letter

BUSINESS conditions continue to be the important factor in livestock trade. Reports this week on the trend of business are on the weak side.

The Hog Situation

Hogs weakened off early in the week, but recovered at the close on very light runs. Short supplies were the only element of strength in the market. The combined total at the eleven leading points was 465,000, against 518,000 last week, 473,000 the same week last year and 529,000 two years ago. Average price was \$9.85 this week against \$9.90 last week.

The futures market was in the main a little stronger than last week. May lights sold at \$10.45@10.60, and September lights at \$10.40@10.65. May heavies sold at \$9.75, and September heavies at \$10. These prices are 10 to 35 cents above last week.

The first month's business of the futures market amounted to 184 cars sold, representing 13,250 hogs, weighing 3,036,000 pounds. Hogs actually delivered on contracts amounted to 315,470 pounds. Prices have ranged from a high of \$12 per hundredweight for September lights down to \$9.50 on March heavies.

Lambs Again Lower

There was a further decline in lamb prices this week, the average price for the week dropping to \$9.30, lowest since November, 1921. Last week's average was \$9.75. The weekly average price is now \$7.60 under a year ago. It is entirely a matter of heavy marketing, with no relief in sight.

The run here was 92,000 this week, against 89,000 last week. A year ago this week the run was 67,000 and the year before that the same. The difference between '29 and '30 tells the story, and it is not for one week alone, but week after week. Western feeders contributed 60,000 head this week. Nor are they through yet. In the meantime the springers are starting to run, Kansas City having some Arizona spring lambs this week that sold at \$13.

Heavy Steers Higher

The spread between heavy and light cattle has widened further this week. Compared with the high time last week yearlings are as much as 75 cents to \$1 lower, and heavy cattle show a gain of 50 to 75 cents during the past two weeks. It is all a case of relative supply. Heavy cattle of quality are scarce, while the supply of light steers is liberal.

Butcher stock has shown little change, except good, light heifers, which have declined with light steers and about as much. Light marketing is the only thing holding the cattle market up.

The run here this week totaled a little over 30,000, about the same as recent weeks, and in line with a year ago. To date twenty markets have had just a few more cattle this year than at the same time last year. Both this year and last, however, are well under steepers.

Top steers sold at \$15 this week, averaging 1,444 pounds. Best lights brought \$14.35, with top heifers at \$13. Average steer price this week was \$12.30, comparing with \$12.40 last week and \$13.15 a year ago.

Beef at wholesale is just a little

higher than a year ago. The market for the coming summer will depend entirely on business conditions.

Weather Grain Factor

For the time being the weather has displaced the Farm Board as the principal factor in the wheat market. Prices advanced this week on reports of dry weather in Kansas-Oklahoma territory, and lack of moisture for seeding in the Northwest. Both domestic and foreign buying was stimulated, and the price gain was around 10 cents over last week.

Private crop reports put the winter crop at around 560,000,000 bushels, a little less than a year ago. These reports also indicated quite a substantial reduction in spring wheat acreage, no doubt gratifying to the Farm Board. Our reporters, experienced in crop estimating, send in estimates which would point to a reduction of fully 10 per cent of the wheat acreage in Minnesota and Montana, about 7 per cent in South Dakota, and 9 per cent in North Dakota, Nat Murray stated. This he compared with the government's report of 5 per cent decrease, a figure secured from questionnaires sent to 50,000 farmers in February.

A Plan to Store Wheat

The Farm Board's Grain Stabilization Corporation announced a move to

work out a cooperative plan with millers in storing the surplus crop and to export American wheat in the form of flour.

"The Grain Stabilization Corporation," the statement said, "has placed before the wheat flour milling industry a plan which it is believed will be helpful in accomplishing the objective of the corporation and at the same time increase the operations of the mills. Increased operation in turn stimulates the demand for cash wheat, increases the available supply of mill feeds, and to some extent increases the consumption of cotton used in bagging mill products. The plan makes available to the corporation a large amount of mill elevator storage room, otherwise idle at this time of the year. Mill storage, however, will not be used to such an extent that it will interfere in any way with the movement of new crop wheat, at or after harvest time."

The plan provides, first, for an arrangement whereby the stabilization corporation may store wheat with the miller, which the miller may later purchase as his needs require, and second, a similar arrangement in regard to the storage and sale of wheat to cover export sales of flour.

Farm work is well advanced everywhere, and with favorable weather from now on corn will go in early. In some places there is doubt about oats seeded two or three weeks ago, on account of the snow and cold since then. Chicago, April 8, 1930. Watson

LIVESTOCK

PITTSBURGH

Cattle

Monday's supply was light, about 30 carloads. Good weighty steers were not numerous and were all wanted at an advance of a quarter or so over last week's prices. The good fat handy-weight steers were also stronger, but ordinary light butcher steers showed little change. One load of weighty steers brought \$13.25 and others \$12.25@13.10. Useful weighty steers but a little plainer went at \$12.25@12.60. Good fat handy-weight steers brought \$12.40@12.75, with fair fleshy kind \$11.75@12.00, ordinary around \$11. Useful light killers went at \$11.25@11.50, ordinary kind \$10.50@10.75 and common on down. No stockers or feeders were offered. A few choice cows brought \$8.75@9 but not many were good enough to beat \$8. Canners went at \$5@5.50, late sales largely around \$5. Bulls were stronger, best heavy going at \$8.50@8.75 and best handy-weights \$9. Ordinary to fair bolognas brought \$7.50@8.

Hogs

Monday's supply was about 30 double-deck carloads. Demand was good and trade active at an advance of a dime or so. Handy-weight hogs went mainly at \$11, with best heavy mixed at \$10.75 and heaviest of around \$10 lbs. at \$10.50. The good 140@150-pound hogs went in with handy weights, light going at \$10.50 large. Light Yorkers, 125-150 lbs., 10.90@11.00. Heavy Yorkers, 155-180 lbs., 10.40@10.50. Pigs, 90-110 lbs., 10.40@10.50. Roughs..... 8.75@9.00
Stags..... 5.00@7.00

Sheep and Lambs

The lamb market eased off last week, closing at \$9 for tops. Monday's supply of sheep and lambs was about 22 carloads, probably one-third of them sheep. The sheep market was very slow and lower, with \$6 the top for handy wethers. Some sheep were held above that figure but buyers refused to bid more. A few choice heavy ewes went at \$5, most of them for less. Good fat lambs were firm at \$9 per

cwt., but the other kinds were slow. Culls sold at \$5@7, largely for medium class mainly \$7.50@8.80. Lots of spring lambs arrived, the tops selling at \$16 per cwt.

Clipped
Good to best wethers..... \$5.75@6.00
Good mixed..... 5.25@5.50
Fair to good, do..... 4.50@5.00
Common to fair..... 3.75@4.00
Inferior sheep..... 3.00@3.50
Good to best lambs..... 7.50@8.00
Medium lambs..... 7.00@7.50
Culls and common..... 5.00@7.00

Cattle
Receipts on Monday were close to 1,000 head. Good veals were steady at \$11 per cwt., seconds \$11@11.50 and others making \$8@10.

CHICAGO

Cattle

Chicago, April 7.—Today's receipts totaled around 13,000 head. The market was steady with best steers at \$14.65. Common to fair steers..... \$8.75@10.00
Fair to prime yearlings..... 10.25@11.00
Fair to prime corn-fed..... 10.50@11.00
Cows..... 6.00@9.00
Heifers..... 7.50@10.00
Bulls..... 6.00@9.00
Canners and cutters..... 4.50@6.00
Stockers..... 8.50@11.00
Feeder and feeder heifers..... 8.00@11.00
Stocker and feeder cows..... 7.50@9.00

Hogs

Thirty-five thousand hogs, including 14,000 "directs," made up the supply. Market a quarter higher with top at \$10.60 and bulk selling at \$9.90@10.60. Top pigs..... \$9.75@10.00
Underweights, 140-160 lbs..... 10.00@10.50
Light, 160-180 lbs..... 10.40@10.60
Light butchers, 180-220 lbs..... 10.25@10.50
Medium butchers, 220-260 lbs..... 10.25@10.50
Heavy butchers, 260 lbs. up..... 9.75@10.00
Stags, 70 lbs. down..... 8.25@9.00

Sheep

Eleven thousand sheep and lambs were on sale. Market strong to 15c higher. Top lambs brought \$9.75.
Native lambs..... \$7.50@9.00
Western lambs..... 8.25@10.00
Shorn lambs..... 7.50@9.00
Feeding lambs..... 8.25@9.00
Wethers..... 6.00@8.00
Yearlings..... 6.00@8.00
Ewes..... 4.00@6.00

LANCASTER

Cattle

Lancaster, April 7.—Beef steers were steady to strong on the Lancaster market today. Early top was \$12.75, while the bulk sold at \$11.50@12.25. Bulls were slow, she-stock fully steady.

Calves were steady to weak with the vealers bringing \$14.50 per cwt.

Hogs

The market on hogs was steady to strong. Top hogs, in the 160 to 210-lb. class, brought \$11.85.

WOOL MARKET

While the Boston wool market continued quiet some business was done last week in fine and half-blood wools at fairly steady prices, and American was a purchaser at recent London auctions. The board market is said to be overshadowed by uncertainties concerning the activities of the National Wool Marketing Corporation, fearing that the policies of the organization will be unsettled and unsettling for a long time to come.

The Buffalo, Wyoming, pool of 65,000 fleeces is reported sold to a Boston broker at 23c, while some growers in bright wool states have been selling to dealers at 22c. Shearing is spreading and the clip movement is expected soon. Fine strictly combing at Boston is quoted at 32c, fine clothing 23@24c, half-blood strictly combing, 32c, half-blood clothing 27@28c, three-eighths combing, 32@33c, quarter-blood combing, 32@33c, clothing 29@30c, common and less 26@27c.

Philadelphia Produce Review

THE long expected advance in the potato market was realized this week when gains of 25c to 50c per hundred were registered in Philadelphia and the receipts of Pennsylvania potatoes dropped off sharply both by rail and truck. Most of the Pennsylvania stock offered at this time is in poor condition as is often the case near the end of the season. The buyers were taken readily and sales were reported at \$3.50 per hundred.

It is uncertain as to whether this advance is a temporary price flurry or whether it is more or less permanent. A few of the leading shipping states have a wider outlet for Maine's and other prices gained and the daily average during the week was around 800 tons, with heaviest shipments from Maine, Minnesota, Wisconsin, Colorado and Idaho. Recent local estimates show the remaining holdings in Idaho at 1,200 to 2,500 cars.

Apple Market Improves

The apple market continues to show improvement, and prices of good quality are higher. Shipments are light and the supply of eastern apples of good quality is limited in both Philadelphia and New York. There is a wide range in quality and this is responsible for what appears to be inconsistent price reports. Some 2½-inch apples are selling for less than 2-inch stock and quality to quality. Yorks sold at \$2.75 per bushel in New York and at most sales around \$2.25.

Green Vegetables

Receipts of green vegetables from early sections are increasing. Some of the nearby growers are making a make in cutting their spinach at this time. The plants are too small to sell well in competition with the supplies of Virginia and Texas. Turnip greens, collards, rape and field cress are meeting a fair demand but there is no uniformity in the quality or price. California and other distant areas are shipping asparagus in excellent quality but prices are averaging lower than usual for this early in the season. If this condition continues it is not likely that nearby grass will open the season at high prices.

Eggs and Poultry

The Philadelphia egg market during the past week was rather sensitive but the variations were not wide. At the closing of the week prices declined a half cent and the market was unsettled. Buyers were quick to sense the situation and held off, limiting their purchases to most urgent needs. Toward the middle of the week prices were steady to weak and the market was more satisfactory.

Fancy large white and brown near-by eggs were in good demand on the New York market and the market for the cheaper grades improved. Pennsylvania and New Jersey white eggs were from 27 to 36c per dozen, and from 27 to 33c and mixed colors 24@29c.

The live poultry market was weak during the latter part of the week and demand was slow. Fancy heavy birds were wanted but average receipts

were slow. The best broilers sold readily. Colored fowl brought 30@33c per pound, Leghorn fowl 28@27c, chickens 24@24c and broilers 25@42c. Fresh killed hot-house broilers were in more liberal supply and prices declined about 2c a pound. Prices ranged from 30@48c per pound.

Butter

The butter market improved during the week. The market opened weak on Monday but a better demand developed. Arrivals of fresh butter were rather liberal but there was a scarcity of the better grades. The larger users of storage butter have turned to fresh goods to supply their trade and this has helped to prevent accumulations.

Speed Growth with the **Sunshine-Feed**

Abundant Sun Vitamins!

Even after you've supplied growing birds with a feed that contains every element needed to build bone, muscle, nerve, blood and feather—there's one more vital element you must supply to get the greatest growth from that feed. SUN-VITAMIN D!

This Vitamin D is the one that helps growing bodies more than anything else get the full food values from what they eat. Sunshine is the natural supply of the D Vitamin. But where can you get an unfailing supply of sunshine in the cold damp days of early spring when birds are just going on a growing ration?

At ¼ the cost and none of the bother of cod liver oil

Cod liver oil is unhandy. Feed that contains enough of it doesn't keep well. Pratts have found the PRACTICAL way. By special processing, their laying mash is now enriched with abundant Sun-Vitamins. This new feature of an old standard feed is as important as its choice cereal, mineral and animal protein ingredients. Just as important as the painstaking care used in buying and blending the dried buttermilk, feeding oatmeal, corn meal, wheat middlings, meat scrap, fish meal, alfalfa meal, and vital

mineral elements. For fine as these ingredients are—they can't do their best work in building bone, muscle, nerve, feather and constitutional strength for long profitable laying, unless birds get abundant Vitamin D at the same time. Pratts Buttermilk Growing Mash makes most growth and health at least cost per pound. See your Pratt dealer. Be sure your new pullets have this up-to-date feed from the start. We'll send you the name of the nearest Pratt dealer upon request.

Farm Facts and Fancies

By ALVA AGEE

THE moves advised to checkmate crop production remind one of a game of chess. The United States grows more cotton than the world's markets will take at a fair price. When forty-seven million acres were grown in 1926 the price fell below twelve cents a pound. Last year the acreage was forty-six millions of acres and naturally the United States Bureau of Agricultural Economics advises: "Other enterprises that offer equal promise of income or that make for reduced farm and family expenses should be substituted for cotton wherever possible."

The Federal Farm Board, speaking a little more fearlessly, tells the planters that they should lop off six million acres from last year's area. This advice seems sound, and the result would be a big increase in the South's corn acreage, the production of far more of its meat, and a corresponding reduced demand for the products of the Corn Belt.

Another Move

The Farm Board is trying to cause the wheat growers in the spring wheat region to cut acreage heavily. This advice is sound, but it would mean the production of more corn, barley and meat. The Corn Belt again would feel the competition. The substitution of crops is the rational course on individual farms and in big areas of production when a devastating surplus in the chief line of production looms up, but as a national policy to be advocated by our authorities it has its embarrassments.

If conditions permitted the substitution of products that we now are importing, we should be getting somewhere. This sort of substitution has its talking points of course, but in fact our farmers have been sufficiently wide awake to try new crops and are not producing many of them in any considerable amount only because there is no money in doing so. Substitution is not a nation-wide cure for over-expansion of our farming area.

This is mentioned in the interest of clear thinking. If we learn what we cannot do, we may stumble on something we can do. What we really need is a big shrinkage in our total farm area, and it continues to be our national policy to increase the area through reclamation by aid of public funds.

Unjust Tax Burdens

One could make a long list of things that the United States does in a most competent way. One thing we do badly and that is the levying of taxes. We get the money, but through methods that are so unfair that the wonder is that the people stand for it. I have been studying a technical bulletin issued by the U. S. Bureau of Agricultural Economics, wanting to see what hope there may be for improvement of conditions. The present ills are so grounded in human selfishness and public inertia that I found little in this analysis that was comforting.

The general property tax is the chief burden on farmers. It provides most of the revenue for local purposes. The most of this money comes from a tax on tangible property, and that means property that the assessor can touch and see. The contribution made by bonds and stocks and notes is relatively small. A rather large part of this intangible property is made tax-free by legislation, and a big part of the remainder is kept concealed.

According to Ability

Inequalities in appraisement of farm lands are glaring. Competent appraisers would help, but this would not bring a reduction in the total obtained from a property tax. The system of a general property tax is working out badly when made the

chief dependence of government. It should be sufficiently skilled in government to place the chief cost of its maintenance on those who benefit most under it. They should be made to pay going and coming, and the farmer would pay less while standing still. What we need in this country is a square deal and we are far from having it.

These statements do no particular good. People have been making them a long time. The influence against change is seemingly too strong. Little headway is made through taxation of automobiles, gasoline, insurance, and in some states, income, but the farm continues to stand and take the brunt.

Some economists have held that the best tax was the one easiest to collect. A tax on the farm fits into that exactly, and the owner does not make an effective protest. We need more headway in distributing tax burdens according to ability to pay.

The Homely Farm

One of the choicest words in our language is "homely," and who ever gave it a twist in the wrong direction was in poor business. It describes that which is homelike, plain, simple, familiar and worth-while. The economist finds tens of thousands of homely farms that he classes as marginal because the soil isn't very productive and the owners do not have much cash income. These people make homes, have enough to eat and to wear, enjoy life and let others do the worrying.

If food were what we lived for, instead of being something to live on, soil fertility would be about the only consideration. Land has other values and one is its ability to fit exactly into the needs of hundreds of thousands of people who want homely farms. They pay little attention to the tariff and debentures and export demand, providing largely their own market for their products, and many of them are rich in satisfactions that the census people neglected to list for questioning. They like a homely farm, and the Creator has provided that which the ultra efficient do not covet.

I may be thinking of them because a prosperous caller the other day told me that the only cure for overproduction was the return of all some what infertile land to trees. I should like to be among those present when the suggestion of moving off was made to some people I know. They are native Americans, know they are within their rights, and are greatly well convinced that most people who have income taxes to pay are not getting much out of life. A nation of homely people, living on homely farms, might not make the world hum, but how do we surely know that the world profits from humming?

CARROT seed should not be planted too deep, just barely out of sight. Yet it may dry out before sprouts. There is less danger of this in the early part of the season. Some home gardeners have a trick of laying boards along the row to hold the moisture. However, these should be removed promptly as soon as the seeds start.

The soil for carrots should be firm and moist so that their growth may be rapid. All root crops are best when they grow quickly.

Thin carrots to two or three inches in the row, but a first thinning may well space them one inch. To give every other one for early use will complete the thinning.

Standard varieties are Danvers Half Long and Chantenay, but a relatively new variety called Nantes-Coreless is superior in quality, though it yields somewhat less.

N. Y. College of Agriculture

Give the bull an exercise lot. He should not be confined to a small stall but should have room to exercise whenever he wishes. A small barn that is always open gives protection from bad weather and the bull can be fed inside the shelter. An outside pen of permanent construction is important. L. W. M.

Another Narrow Escape

ON March 27th the writer visited Mr. William Smick of Salem county, New Jersey, in company with Mr. G. I. Ball, the county agricultural agent. Mr. Smick at once informed us that he had narrowly escaped being killed by his four-year-old bull on the day previous. Here is the story as Mr. Smick told it:

"The bull was in a far corner of the yard when I stepped out to drive him into the barn. I reached the center of the yard when I saw him start rushing toward me with his head down. I picked up a corn stalk, thinking I could frighten him away. He had always seemed like a gentle, peaceable fellow up to this time. The corn stalk failed to stop him.

"I started to run but the bull caught me on my right side with his head and threw me 15 feet—right against the manure spreader which stood near the stable entrance. He struck me the second time, but I managed to crawl under the spreader before he reached me again. He was mad all right. If the spreader had not been loaded he would have upset it and 'got' me in spite of anything I could have done to save myself.

"Today I feel badly bruised and battered. That bull must go into a bull pen or to the butcher shop right away. I own him in partnership with the owner of this farm and must see my partner about this matter at once."

Protectors of Wild Herds

We were anxious to see the wild animal that had made such a sudden attempt at murder. There he stood in one end of the milking barn, tied by heavy leather straps through the two rings in his nose. He looked frightfully dangerous. The wide open eyes with large portions of white showing reflected his battle charge of the day before. His weight was 1,700 pounds and he possessed unusually good type and breeding. His ten daughters, all calves and yearlings, are a promising lot.

This particular bull's instinct caused all the trouble. All bulls over 18 months of age are inherently and potentially dangerous and should be treated as the rhinoceros, tiger or lion of the circus. The early male ancestors of our modern sires fought against most any kind of wild animal of the herd of which they were head. Domestication has not eliminated that instinct to conquer and kill. Today a bull's brains should be thought of as dynamite that can suddenly be set off by the match of instinct. No one can truly say when that match will be ignited.

Pens built of strong, heavy material must be built for our powerful bulls of today if they are to be properly handled. I can recall 26 dairymen who have told me during the past several years that they narrowly escaped being killed or seriously crippled by their herd bulls. In addition I knew

two others who were killed and am also acquainted with two successful dairymen who were confined to the hospital for six weeks on account of serious injury by bulls.

Besides this safety factor there is another which is influencing thousands of dairy farmers throughout the country to build adequate pens. This is the factor of keeping the bull fit, thus insuring vitality and longevity which will enable him to prove himself through his offspring. The demand for good proved sires is growing rapidly throughout the country. The dairymen are growing tired of taking a chance on a new bull every two or three years. As herds grow healthier, aged sires are being exchanged, leased, or purchased after they have proved they can transmit those qualities of production and type which are so essential in this day of high production costs. E. J. Perry.

Days of Good Horses

ON returning to the farm I was working in 1911, I found in the pocket of an old overcoat a list of colts for sale—responses to a want ad we had run in the paper of an adjoining county. This list contained upwards of twenty young horses, three and four years old—from one to half a dozen to the farm.

We bought one of these horses in February for \$200, running in a lot with several others. This horse was "puffy" when bought and stalked badly as soon as tied up in a planked stall. He was that way to the day we sold him to a Boston buyer for \$255 eighteen months later when past five years old. He weighed 1,905 pounds when led from the blacksmith shop with his shipping shoes on.

Another team of three-year-old colts was held at \$425, which we passed up but bought two months later for \$415. By the terms of the buy we had to drive after these colts over twenty miles from our farm. On the way home we came to a covered bridge and the horses refused to enter. We drove through the bridge with the buggy, took out the old pacer and led him back where we placed him between the colts and led the three through the bridge with no trouble.

These were a chestnut and a strawberry roan, not mated even in type but always worked well together because raised together. They sold at public auction to a neighboring farmer when coming ten years old for \$400. The horse shipping business had already fanned out.

Last fall we attended a dispersal sale of a local horse trader, where the animals sold from \$14 to \$160, every horse seeming to have from one nick to several. When you buy a draft critter these days you can't think of selling him to Boston or New York—you buy for keeps, so we took on three young mules that went to a price scare of \$150 apiece! G. P. Williams.

John Deere
KL Cultivator

Quick, Easy Adjustability for Good Work In All Row Crops

The John Deere KL is efficient weed-killing equipment quickly adjustable to any row crop on your farm. With the KL you can cultivate rows as narrow as 28 or 30 inches or as wide as 40 inches by a few simple, easily-made adjustments in the cross axle and shaft. Definite markings on these parts insure proper settings. Wedge clamp permits adjusting shanks for narrow or wide cut.

Easy handling in the field is a feature of the KL you'll appreciate from the minute you start down the row. Convenient lever controls for depth, rig spacing and dodging are within easy reach as you ride along. You can raise or lower both rigs with the handy master lever without stopping the team at row-ends.

John Deere NJ
Two-Row Cultivator

The Two-Row Cultivator built especially for good work in narrow row crops. Spacing lever enables you to follow rows planted with one- or two-row planter. One master lever raises or lowers all rigs—no stops at row-ends.

John Deere Cultivators have the features that mean more good work per day with less effort on your part. See them at your John Deere dealer's. Write to John Deere, Moline, Illinois, for information regarding the type that interests you. Ask for booklet K11-756

Just DIP seed potatoes in Semesan Bel for a BIGGER YIELD

Semesan Bel treated seed produced this bumper potato yield for Reed Brothers in Maine.

Saves time and labor in treating Controls seed-borne diseases Improves quality of crop

Why waste hours of valuable time on messy old-fashioned soak treatments for seed potatoes, when a quick and modern treatment is at hand?

Du Bay Semesan Bel does everything that a seed potato treatment should do. It controls surface seed-borne infections of scab, Rhizoctonia and black leg. Tests and practical use have proved that it improves stands and increases yields.

But Semesan Bel does more. It saves time and labor. For this treatment is instantaneous! No soaking—just dip the seed and plant. That's all. By this modern method, one man can easily treat as much as 400 bushels of seed potatoes a day.

Reports from practical growers are equally convincing. Daniel Leasure harvested an increase of 60 bushels per acre on his Maryland farm. From Maine, A. H. Christie & Son report that their Semesan Bel treated seed outyielded untreated seed 5 barrels an acre and produced 7 barrels more per acre than corrosive sublimate treated seed. J. F. Kendrick of Ohio writes that Semesan Bel increased the yield and prevented development of seed-borne diseases. In New York tests, Semesan Bel treatment gave a 20% increase on early potatoes, and one of 15% on late potatoes.

Semesan Bel for sweet potatoes

Semesan Bel treatment also improves sweet potato yields by controlling surface-borne black rot and scurf or soil stain. Just treat the seed and dip the sprouts before setting. J. E. Dutton & Son, Delaware, report their yield from treated seed was "bright, clean and disease-free."

Easy, inexpensive treatment

One pound of Semesan Bel will treat from 16 bushels of small seed to 22 bushels of large seed potatoes. And treatment is both easy and safe! Ask your dealer for free Semesan Bel pamphlet. Or write Bayer-Semesan Company, Inc., 105 Hudson St., New York, N. Y.

RUPTURED

people enjoy new comfort with this improved sanitary appliance

Whether you play golf or lead a less strenuous life, an appliance has been perfected that holds ruptured, increases comfort, and promotes healing. Surprisingly light in weight, constructed of materials that are cool, sanitary and non irritating—it has been adopted by many leading doctors. In a scientific manner, night and day, at work or rest, it holds the tissues in place and hastens healing. Write today for 10-day trial offer and Free Rupture Booklet. Sent in plain sealed envelope. TWO inquiries concerning the starting of asparagus beds have come to hand and deserve detailed consideration. I know from traveling over a rather wide area that asparagus is not properly appreciated as a spring and early summer vegetable (maybe it is not a vegetable, but I don't know what else to call it). In the area along the Atlantic seaboard it is as staple an article of food from April to July as bread or potatoes. When properly planted and attended asparagus will turn off a surprisingly large amount of good, healthful food.

One of the inquirers asks whether roots at \$3 per hundred is a good buy, and if one should plant two or three-year-old roots. There is no need of paying such a price to start a bed. The best roots can be had from \$10 to \$13 per thousand, and to the second I would answer, plant good one-year-old roots in preference to either. Some growers of roots make a practice of grading their one-year roots into three grades, calling the best and biggest three-year-old roots, the second size two-year roots, and the culls are sold as one-year-old roots. This is a most reprehensible practice. I would not plant the culls if they were given to me. Order one-year-old roots and insist that they be good vigorous plants. It is the only kind worth planting.

When I decided six years ago to plant about three acres of asparagus, and not having the ground ready that spring, I decided to grow our own plants. I did not at first know how to go about it, nor could I find anybody in my community who ever had grown any. I hunted through one of my gardening books and found the process is simple. I went into one of Philadelphia's many good seed houses and bought one pound of Mary Washington seed (the best variety I know of) and prepared the soil according to instructions. I selected a piece that was as free as possible of weeds.

It was made as fine as possible, rolled with a lawn roller, and raked until it was thoroughly fine and level. Then I applied a generous dressing of high-grade fertilizer and this was well worked in. The garden seeder was then made ready by adjusting and setting so as to sow just the right amount of seed. A garden seeder is an invaluable machine for the gardener, as it will sow more evenly and cover more uniformly than it is possible to do by hand. Besides, it sows rows in such alignment that hoeing and cultivating is easy, a condition that I fully appreciated later.

I awaited anxiously for the plants to appear. I did not know what to look for, having never seen any baby

asparagus plants. I waited and waited, and was about to conclude that the seed was bad at the end of two weeks. There was not a sign of anything but the common garden variety of weeds showing themselves. Finally, I saw tiny green spears here and there that were different. A heavy rain and hot sun had baked the fine soil so that I doubted if such delicate shoots could get through. So I ran a little corrugated rolling implement over the rows and broke the crust. Then came a gentle rain, and I was agreeably surprised in a couple of days to see a perfect stand in every row.

Asparagus plants are small and brittle at first and require care in weeding and cultivating. Here is where another garden implement comes in handy,—the push cultivator. By putting the sweeps on, and running them shallow, weeds can be cut off below the surface and the work can be done close to the rows. Here is where the value of a seeder is shown,—the plants are evenly placed in the row. Cultivation was continued throughout the season, and by fall the plot was a solid mass of fine, feathery asparagus plants, several thousand of them.

Early the next spring the piece of land in which we had grown potatoes the year before was plowed deep and harrowed thoroughly. Next, it was staked off in rows seven feet apart. A plow was used to make the furrows, a round trip to each row and an extra furrow made in the bottom. This made a trench about ten inches deep. The plants were spaced out of their setting and sorted, only the largest and best being set in the main plot. Some of the culls were planted in a piece of row by themselves, but these never paid for the trouble of setting.

In setting the roots care must be taken to spread them at least two ways, leaving the crown upright under the soil. I found that by grasping the clump with the left hand and inserting the third and fourth fingers into the mass of roots, I could separate the numerous roots into two nearly even groups. The set was then placed in the bottom of the trench, crown up, and the right hand was used to draw dirt around and over the plant. After the row or rows are filled with plants, a cultivator may then be run between the rows and this rolls dirt down over the plants. Three or four inches of dirt is sufficient at first. Shallow covering allows the sun to warm up the plants and a few days later the cultivator is again used, and so on until the ground is level.

I hope readers will excuse this rather detailed description of asparagus planting, but many have asked about it.

Marvin V. Brubaker planted one acre of Irish Cobbler potatoes on St. Patrick's Day, March 17, 1930. He is known as an early planter, having started his crop last year on March 21st.—Luke W. Martin.

Governor Fisher laid the cornerstone of the new State Farm Products Show building at Harrisburg on April 1st. The building, which will house all of the annual winter farm show under one roof, is now under construction. Much of the steel structure is in place and the outside walls are going up. This building will make available three times the space covered in former shows and is expected to be finished in time for next year's event which is scheduled for the third full week of January, 1931.

More Logging Frolics

By G. W. BUNNELL

job, and elevated to the position for which it was intended; and the crevices "chinked" with moss and clay. Against one gable a fireplace was built from rough field stones and clay, for both heat and culinary purposes. The skill with which this work is done is attested by the fact that some of these chimneys are still erect and unsupported after close to one hundred years, and long after the logs of which the structure was composed have decayed and returned to the soil.

The Task of Clearing Land

Shelter thus provided, the herculean task of clearing the land of the heavy growth of timber was begun and extended over a considerable term of years. The first operation was "under-brushing." This consisted in going over the tract and cutting as close to the ground as possible all except the larger timber. This accomplished, that remaining was felled at right angles to the slope of the land, trimmed of limbs and cut into "logging lengths," usually about twelve feet.

It was all done with axes, as saws were very little used at that early date; and when we first participated in a "clearing" in 1866 axes were still relied on almost exclusively. It was deemed advisable to do the felling as far as possible when the trees were in leaf, as it was of assistance in getting a good "burn," which very materially lightened the labor of clearing, as much of the small stuff was entirely consumed without piling.

Fallows were usually "set" in late July—another operation in which the neighborhood joined; and then followed the "logging," which was almost universally accomplished by "logging bees." They were afternoon affairs; and the attendance was by no means limited to three or four "crews." Every one within a reasonable distance was almost sure to be on hand, enough to log up almost any cutting in a single afternoon.

The methods here in vogue were similar to those described by Mr. Kester with slight variations. Three men and a pair of cattle constituted a "crew," one man handling both team and chain, while two did the rolling.

Sections having been staked out and assigned, operations were begun at the foot of the slope, a location selected for a heap and the first log placed. The oxen, being accustomed to the work, needed but little attention; and it was seldom necessary after the heap was once started to go to their heads, they alternately bringing in a log first from one side and then from the other until the pile was completed.

When drawn to the heap and the chain "dropped" the logs were quickly taken care of by the "rollers." Their equipment consisted of a skid and a hand-spoke each, no canthooks or peavies being used here at that early date. The second log was rolled snug against the first. On this the skids were elevated and the third log dropped in the depression between the two on the ground. The fourth log formed the foundation for the third tier that when finished contained three logs. This operation continued until the pile was as high as could be conveniently rolled, usually as high as the men's shoulders.

The hand-spikes were used until the log was waist high, when they were dropped and the men used their bodies to propel the log to its destination.

Should any "sogs," as the down and partially decayed timber was called, be encountered, they were placed in the center of a pile and surrounded by hardwood that assisted in the burning.

The pile being completed, the men moved up the slope to the edge of the unlogged timber, and another heap was begun. Much good natured rivalry was always in evidence, spurring the men to do their best; and they loved the work.

What appetites it produced. During the logging the ladies had been busy in preparing a feed that, while snails or garnishes were conspicuous by their absence, was entirely satisfactory to the begrimed workers and had staying qualities. A roasted sheep or lamb was popular as the piece d'resistance, but was not always obtainable. Following the supper, dancing was often indulged in until late in the evening when the company dispersed only to get together again the following afternoon and "log up" another fallow.

A Community of Interests.

These were days when conditions were primitive, and there was much that seemed hard and unyielding, but men were men, hearts were large and sympathetic, and there was a community of interests and unity of purpose that is rarely discernible in these latter days. The frequency and popularity of these gatherings for mutual help is shown by the fact that my father often related how for three weeks one fall he attended a logging bee every day. He had two yoke of oxen, and alternated them from day to day.

But it is regrettable that much of this land was ever cleared of its timber, and at a time when it was practically all burned. Thousands of acres that supported a splendid stand of timber is, under present agricultural conditions, a liability rather than an asset, and not worth the taxes assessed against it. Although this strip of country has many fertile farms on which are attractive homes housing an industrious population of farmers, it is our belief that had

A LED BULL

THE man who leads a bull by a rope or a strap takes a chance. Oliver Walton of Nine Points, Lancaster county, Pa., learned this when he led his bull to water April 4th. The bull suddenly attacked Mr. Walton and laid him up with several fractured ribs. Another bull story appears on page 3 of this issue, along with some wholesome advice.

ENDORSED BY SCIENCE

SCIENCE has sauntered up to verify the verdict of small boys and others who have long held the watermelon in high esteem. Tests made by the Bureau of Home Economics, U. S. Department of Agriculture, reveal vitamins in the juicy fruit. This stamp of approval can add little to the fame of the melon in certain quarters, but it may be a hint that most things good to eat are all right, before or after investigation.

COST OF PRODUCTION

THE representatives of Kansas wheat growers recently held a conference at Wichita to consider the problems before them, particularly competition with other areas where wheat may be grown at low cost. They concluded that they can compete with anybody anywhere if they utilize the lessons of agricultural science in increasing yields per acre and the economies of modern machinery in doing their work. Strange as it may appear nobody even mentioned marketing, stabilization or price-fixing as methods of perpetuating the wheat industry of Kansas.

A NEW BUREAU

AGRICULTURAL engineering is becoming more and more important as agriculture advances. It includes farm power, machinery and implements, rural electrification, buildings, water systems, sewage, land drainage, irrigation, erosion of soils, and a host of things incidental to these. Now the subject is represented in the United States Department of Agriculture by an obscure division in the Bureau of Public Roads. It should be taken out of that obscurity and that illogical relation and given a place in consonance with its importance in the industry of agriculture. Because it is of such great and growing importance we are in favor of the

movement of the American Society of Agricultural Engineers to establish a Bureau of Agricultural Engineering in the Department of Agriculture. The sooner it is done the better. Only a decade ago we were told by certain authorities that there was no such thing as agricultural engineering, but now these same authorities admit that they were wrong, recognize the work and the members of the new profession and respect both. Let us give them both proper recognition in the Department of Agriculture and everywhere.

NEW USE FOR RADIO?

TWO radio stations have applied to the Federal Radio Commission for permits to operate on low frequencies for the purpose of destroying insect pests. Nobody appears to know just what these stations hope to do or how they plan to do it, so there is plenty of room for conjecture. May we hope that some day, by some use of the etheral wave, we may chase away or destroy the bed bug, the squash bug, the potato bug and the host of other pestiferous bugs? And if bugs may be so controlled why not other things as well? The germs which destroy so much life and property, for instance. Probably we shall find that "low frequencies" will apply more to the instances of such pest eradication than to the means of it.

WHEAT SCHEMES

NEARLY every week somebody comes along with a plan whereby wheat production may continue on a large scale and prices may be maintained. All of these plans are based on the theory that the government can perform commercial miracles regardless of actual conditions and not one of them is worthy of serious consideration. We have been asked by a few of these theorists to give a better plan before condemning theirs, so here it is: Leave the regulation of wheat prices, the time and method of marketing, the movement into distribution and consumption, the area seeded, the volume of production, and all other problems of this kind, to untrammelled commercial and natural influences. Let the studious reader carefully consider this little scheme and all it implies, then tell us wherein it is defective. It is old-fashioned, of course, apparently clear out of style in these days of meddling and monkeying with economic forces, but what new-fangled plan is as good?

TALKED SHUT

LAST week a bank was forced to close its doors after a long and almost successful struggle. The bank's officers state that while it had survived eight years of deflation and depression it could not survive four years of talk, or what they call "vicious gossip, with no foundation in fact." In other words this bank was talked out of business. So many depositors were induced by the current gossip to withdraw their money that the bank could not go on. This is not the only bank that has been talked shut, nor are banks the only things that have suffered by too much talk. How much has been talked off the price of farms during the past ten years, even though a great deal of the talk was not vicious but well meant? Nobody can say how much, but it is a fact that too many investors have been talked out of land just when their support was most needed.

INCONSISTENT

THE Congress of the United States enacted a law for the purpose of regulating grain exchanges and trading thereon so that manipulation and control of markets would be impossible. The Supreme Court of the

United States declared that law to be unconstitutional. Then the Congress was so impressed with the necessity of preventing manipulation that it enacted another law, reciting therein the statement that trading on exchanges "is susceptible to speculation, manipulation and control." That law is now in effect, administered by the Department of Agriculture through the Grain Futures Administration. There may be some difference of opinion about the value of the law but there can be no doubt about its purpose. It was enacted with the clearly expressed purpose of so regulating markets as to prevent manipulation and control.

Seven years after the enactment of the above law the Congress of the United States enacted another law which authorizes manipulation of grain markets and finances it with public funds; also provides an agency to do just what the earlier law was intended to prevent or prohibit. For no matter what we may call the market operations of the federal agency and its subsidiaries they necessarily amount to speculation and manipulation on a vast but thus far unknown scale. And the head of the Department charged with the duty of enforcing the first named law is one of the federal board authorized by the second law to violate the first law's fundamental purpose. There are other inconsistencies in the legislation referred to but this is enough for one time.

ABANDONED FARMS

THE Cornell Experiment Station has recently published an interesting bulletin on Abandoned Farm Areas in New York. In it we find that during the forty-five years 1880-1925 the area of land in farms in New York declined 19 per cent, but the area of land in crops declined only 9 per cent. During this period the production per acre increased 17 per cent and the total production increased 7 per cent. All of which is ample evidence of better farming. The investigators say that New York can abandon still more poor land and yet increase food production to provide for its growing population. Better farming will produce more food on fewer acres.

One striking fact is that abandonment of unfit land is "an exceedingly slow and painful process." In most of the areas investigated abandonment has been going on for fifty to seventy-five years and is still "far from complete." Farms don't remain abandoned. Every time abandonment is found necessary by one group there is a new group willing to try to do what their predecessors have found to be impossible—make a living on unfit land. Perhaps the best lesson farmers or would-be farmers can learn from this is to stay away from land that never was good. Land that was once productive may be made so again, but land that is naturally poor is hopeless—at least it is so for the man who must live by farming.

FROM LIFE

OVER a century ago a young civil engineer died of typhoid fever while engaged in the construction of a canal. He was poor and his family was scattered. One boy of nine years was "bound out," as the custom then was, to a man who did not supply him with shoes to wear during the winter. An older boy, bound to the same man, got shoes for the younger one, whose relatives came and secured his release. That was the last time these two boys saw each other for seventy-four years. Then the younger heard of a very old man who bore the same name as his benefactor. He went to see him and thank him. They recognized each other at once and had a glorious reunion. Facts are often stranger than fiction.

New Jersey Farm Comment

By G. W. HARRIS

A YEAR'S meter record on five New Jersey dairy farms shows that the cost of cooling each can of milk to 50 degrees Fahrenheit by electric refrigeration was less than if ice had been used.

The approaching warm weather and the more strict regulations being enforced by milk dealers to meet demands for better quality milk are now turning the thoughts of dairymen toward some method of dairy refrigeration. Most producers who ship to high quality milk markets are required to cool their milk to 50 degrees Fahrenheit, a demand which in many cases requires the use of ice or mechanical refrigeration.

This has brought about an increasing interest in comparative costs of electricity and ice for refrigeration. W. C. Krueger, New Jersey extension specialist in rural electrification, has compared these figures and finds that the initial costs are comparable. The ice house and storage approximate the cost of a refrigerating unit and box.

Mr. Krueger has taken representative figures for New Jersey and estimates the home storage of ice is costing farmers about \$3 a ton and, since 50 per cent more ice than is needed must be stored to allow for melting, the ice actually used for cooling costs \$4.50 a ton. A charge of six cents per hundred pounds of ice is added for the icing of a tank, making a total cost of 28 cents per hundred.

From 27 to 30 pounds of ice are required to cool and hold a 40-quart can of milk at 50 degrees, the amount depending on the size of the cooling tank. This figures the cost of milk refrigeration by ice between eight and nine cents a can.

Refrigeration by electricity on five New Jersey dairy farms cost but six cents for every can of milk cooled and held at 50 degrees Fahrenheit. The year's meter records on these farms show a variation between .6 and 1.7 kilowatt hour for each 40-quart can cooled, the average being one kilowatt hour. Six cents per kilowatt is a fair average charge for such power in New Jersey.

Mr. Krueger warns dairymen against buying too small cooling units, for they are inefficient and costly when overloaded. Many, who have tried to keep first cost of installing electric dairy refrigeration at a low figure, have bought units with a too small capacity for their needs and now find the operating expense is too high to be economical. Even under maximum load and in hottest weather; a refrigerator should not have to run much over half time.

ALTHOUGH only about 2,000,000 acres of land in New Jersey are devoted to agriculture, it is one of the leading states in the production of vegetables.

Based on the quantity produced last year New Jersey ranks second in the production of asparagus for market while California is first. New Jersey holds second place in the production of string and snap beans, egg plant, peppers and tomatoes for market while Florida markets the largest volume of these vegetables. In growing tomatoes for manufacture New Jersey is exceeded only by Indiana.

Even in the production of that vegetable despised by children, spinach, New Jersey rates third place. Among the nine late states New Jersey is second in the production of cantaloupes and Colorado is first. Among all states producing cantaloupes, New Jersey is sixth, California first, Colorado second, Arizona third, Maryland fourth, and Indiana fifth. In the production of celery New Jersey holds sixth place, California first, Florida second, New York third, Michigan fourth and Colorado fifth.

In the entire country New Jersey places fifth in the production of cabbage, Texas is first, Louisiana second, Virginia third and Florida fourth. New Jersey's rank in the production of cucumbers for market is seventh, Florida first, Texas second, South Carolina third, Alabama fourth, North Carolina fifth and Louisiana sixth.

Sweet potato production in New Jersey is in eleventh place as compared to other states. In the production of cranberries the state is second, Massachusetts ranking first. New Jersey is fifth in peach production. California being the first, Illinois second, Georgia third and Arkansas fourth.

FOX and Son Poultry Farm entry of White Leghorns with its record of 1,392 eggs produced since the opening of the Passaic County Egg-Laying Contest continued to lead all New Jersey en-

tries at the end of the twenty-sixth week. This flock ranks first in its class and third among all competitors.

Birds from the Spartan Rock Farm at Nutley lead their breed division with 1,312 eggs and stand sixth among all entries. White Leghorns from the Darfield Poultry Farm, Preakness, are second in their class with 1,297 eggs to their credit and rank seventh among all contestants. The United Poultry Farm flock from Toms River is eighth with 1,286 eggs. In the same class the Quality Poultry Farm entry from Montville, with 1,281 eggs recorded, stands ninth in total production.

NEW JERSEY'S highest scoring entry in the Vineland Egg-Laying Contest, a Rhode Island Red pen from Woodview Poultry Farm, Mount Holly, improved its position during the twenty-sixth week of competition by advancing from

City Man's Idea of Farm Census

fourth to third place among all contestants.

The total score of the Woodview Farm Reds is 1,382 eggs, or 109 less than that of the leading pen from the Scott Poultry Farm, Groton, Mass. Only one other New Jersey flock is listed among the first ten entries in total production. This is the Rhode Island Red entry owned by Louis D. Schable of Shiloh. A 1,359-egg score puts this flock in fifth place.

FOR the second time the flocks in the Hunterdon County Egg-Laying Contest have produced the highest weekly percentage of eggs of all the contests in the state. During the twenty-sixth week of the contest 2,483 eggs were laid, giving that contest a 71.37 per cent production record. Vineland's high record is 69.95 per cent and Passaic's is 68.93 per cent. Production of the Hunterdon flock, which is under the direction of G. H. Schmidt, is now approaching that of the other two contests, even though it got off at a slow start in the beginning.

Leading the contests is the White Leghorn flock from Fox and Son Poultry Farms at Little Falls with its total score of 1,236 eggs. Second place is held with a 1,193-egg record by a pen of Leghorns owned by Jerseyland Farm, Point Pleasant.

In fact, eight of the highest ten records are held by New Jersey owned birds. Kerr Chickeries, Frenchtown, placed fourth with its flock of Rhode Island Reds laying 1,165 eggs; Lauderdale Brothers, Lambertville, fifth with White Wyandottes, 1,128; United Poultry Farm, Toms River, seventh with White Leghorns, 1,124 eggs; Broadview Farms, Blawenburg, eighth with White Leghorns, 1,095; and Joseph Joachim, Riverton, ninth and tenth with two pens of White Leghorns, 1,087 eggs and 1,083 eggs.

THE New Jersey Department of Agriculture is on the air. If you tuned in your radio last Monday afternoon at 4:45 on station WOR you heard Wm. B. Duryee, Secretary of Agriculture, tell of some of the trends of agriculture in New Jersey in the first of a series of talks that will be broadcast by the Department each

Monday over WOR.

If any housewife wants to know how to tell a good egg from a bad egg, how to make New Jersey eggs good, or how to get more of these eggs on the breakfast tables in New Jersey homes, just tune in on WOR at the scheduled hour next Monday and listen to Alben E. Jones' discussion of "Jersey Eggs for Jersey People."

Each Monday afternoon at 4:45 o'clock for 15 minutes duration the Department of Agriculture will broadcast as follows:

April 28.—What Animal Disease Control Means to Human Health—Dr. J. H. McNeil, Chief, Bureau of Animal Industry.

May 5.—Feeding New Jersey's Increasing Population—H. B. Weiss, Chief, Bureau of Statistics and Inspection.

May 12.—The Machine Age in Agriculture—Secretary Wm. B. Duryee.

May 19.—Adventures in the New Culture of an Old Fruit—Miss Elizabeth C. White, of Whitesbog. Miss White is New Jersey's famous woman horticulturist, whose accomplishments in blueberry culture are known throughout the country.

May 26.—Quality Factors in Milk—Secretary Duryee.

June 2.—Either Mr. Weiss or Mr. Edgar G. Rex, entomologist in charge of plant pest control, will speak of "The Insect Onslaught upon Human Food."

June 9.—Fresh Fruits and Vegetables for the Consumer's Table—W. W. Oley, Chief, Bureau of Markets.

June 16.—Combating the Japanese Beetle.

AN interesting situation has developed in the early potato growing counties of Maryland and Virginia Eastern Shore this spring. In the face of a vigorous campaign for limitation of acreage, put on by the Bureau of Agricultural Economics of the United States Department of Agriculture, by the state marketing organizations and by the Interstate Early Potato Commission, and sanctioned by the Federal Farm Board, the farmers of these counties have planted about 7,000 more acres in potatoes than they did last spring.

Numerous meetings were held in the early potato area, and speakers used charts and graphs and much oratory to prove that any increase over the 56,000 acres grown in Virginia and the 14,200 acres grown in Maryland Eastern Shore territory last year would mean lower prices, agricultural distress and perhaps even bankruptcy. And the farmers promptly went back home and prepared more acres for planting!

Potato growers on the Shore received an average of around \$1.25 a bushel last year. Two years before, when they had a bumper crop and potatoes from the Far South came into market abnormally late because of weather conditions, the price fell to around 60 cents, and even below. A good many acres were never dug. The federal and state marketing specialists seem agreed that this year holds promise of similar disaster, basing their judgment largely on acreage totals. But the farmers, apparently, are willing to gamble on another factor—the weather.

Normally, the Eastern Shore furnishes a large share of the potatoes handled in the big Eastern markets in July and August, and usually has little competition. If the potatoes from Florida and the Carolinas are well out of the way before the Eastern Shore crop is ready for market—and there seems a fair chance that just that may happen this year—the judgment of the growers may turn out to be better than that of the market forecasters.

R. B. T.

AT the request of North Jersey vegetable growers who are seeking a means of cutting their high labor costs, the Extension Service of the State Agricultural Experiment Station has scheduled a two-day demonstration of labor-saving machinery and equipment for April 25 and 26.

The turn of Paul Scoles on Paramus Road, four miles from Mackensack, has been selected for the demonstration.

Poison Ivy, Poison Sumac and Their Relatives

By Dr. E. M. GRESS
Pennsylvania State Botanist

MANY people are very susceptible to ivy poisoning, which is caused by a non-volatile oil. These minute particles of oil come in contact with the skin and cause inflammation followed by little watery blisters which itch and burn, and spread rapidly over the body if not checked. All parts of the plants are poisonous and at all times of the year. Some people are so sensitive to the poison that they believe they get it by merely walking past the plant without coming in contact with it. It might be possible to carry the small oil particles on dust or pollen, but more likely the persons affected have unconsciously come in contact with the plant or perhaps they have got the poison by handling their shoes or some other parts of their clothing that have come in contact with it.

A young man who was working in the biological laboratory unconsciously laid his coat on a dried specimen of poison ivy. A few days later his sweetheart had a very severe attack of ivy poisoning on her cheek. She declared that she had got it by walking by on the leeward side of a poison ivy vine.

Prevention is easier than curing, and those who are susceptible should be cautious and, if possible, not come in contact with the plant. If they have come in contact or suspect that they have been exposed to it, the exposed parts of the body should be washed thoroughly with hot water and soap, or bathed several times with grain alcohol.

Preventives and Remedies

The non-volatile oil is soluble in alcohol and is emulsified by alkalies such as are used in most soaps. Indeed, a good preventive for one who is very susceptible to the poison is to cover his hands and face with a thick lather of soap, if he knows that he is going to be exposed to the poison. The lather dries on the skin and the particles of oil settle on the film instead of coming in contact

with the skin and may easily be washed off, thus preventing an attack.

Another preventive is a five per cent solution of ferric chloride in a mixture of 50 per cent water and 50 per cent glycerine. This should be rubbed on exposed parts of the body and allowed to dry without wiping.

Numerous remedies for curing ivy poisoning are recommended. One very highly recommended is a three per cent solution of potassium permanganate. The photographers' hypo is also very effective on some people. A 50 to 70 per cent alcoholic solution of sugar of lead is an old and reliable remedy. This is also used in the form of a salve.

Poison ivy is a vine climbing by means of aerial roots which cling by terminal disks to trunk of trees, fence posts and other supports. It is sometimes confused with Virginia creeper from which it may easily be distinguished by its three instead of five leaflets and by its white instead of blue berries.

"Leaflets three quickly flee,

Berries white, take to flight."

There is a low erect shrub form of poison ivy which sometimes covers large areas. These upright branches spring from creeping underground stems. Many people are acquainted with only one form of the plant, and therefore do not realize that they are both equally poisonous. Both the high-climbing and the low, erect shrub form are very common.

Poison ivy is very abundant and of no economic use whatever, consequently every effort should be made to eradicate the plant. It is difficult to eradicate by digging, because of the danger of becoming poisoned. However, there are several chemicals which may be used to kill it. More than one application may be necessary, because as long as the underground parts are alive new plants will come up.

Among the remedies used in killing poison ivy are the following: Spraying the plants with sodium arsenite—one pound dissolved in five gallons of water; or with iron sulphate—two pounds to one gallon of water; or with sulphuric acid—one pound

Poison ivy—high-climbing and shrub forms.

to five quarts of water; still another spray may be made by adding one pound of white arsenic and two pounds of sal soda to five gallons of water.

Caution: Care must be used in mixing sulphuric acid and water; heat is generated which may cause an explosion. The sulphuric acid must be added very slowly while stirring, and the mixture should be made in an earthenware vessel. This, as well as all the other chemicals, should be handled carefully and kept from the skin and clothing and away from children.

Poison sumac, swamp sumac or poison elder (*Rhus vernix*) is a shrub or sometimes a small tree even more poisonous to the touch than poison ivy. Fortunately, it is not so common, being found only in swamps and bogs especially the latter. It is a near relative of three other shrub forms of sumac: the stag-horn sumac (*Rhus typhina*), the smooth sumac (*Rhus glabra*), and the shining or copal sumac (*Rhus copallina*), none of which is poisonous but all of which are suspected by those who are not acquainted with the poison form.

In the poison sumac the stem (rachis) to which the seven to thirteen leaflets are attached is round and not broad and winged like that in the shining sumac, which is a very marked distinction between these two species. (Continued on page 14.)

1. Poison sumac, a shrub or small tree which is even more poisonous than poison ivy.
2. This picture shows typical leaves and flower of poison ivy.
3. Shining sumac, a non-poisonous shrub.
4. Smooth sumac is another non-poisonous member of the sumac family.
5. Stag-horn sumac is common in this state. Like the smooth and the shining sumacs it is not poisonous to touch.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

CHAPTER I

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Stoom, Inc.

AT the outset, it must be explained that the Mastermans (relatives of the present writer), also the Woodbridges and many other settlers, of several different nationalities, went to the Peace River country on the strength of information they had received that the new line of the Grand Trunk Railway, of Canada, would immediately be constructed through to the Pacific Ocean by way of the valley of the Peace. It was sure to go that way, they were told, and an alluring prospect of fertile farms near that fine line of railway was what induced them to migrate so far north.

The hopeful settlers preempted excellent land in the vicinity of Moberly Lake, and raised good crops of wheat for three years.

But no trust in railroads—before they are built! As a result of much exploration and many preliminary surveys of different routes through the Rocky Mountains, the railway engineers finally chose what is now known as the Tete Jaune, or Yellow Head Pass route, and the new line was constructed through the mountains to the sea, at the new terminal town of Prince Rupert, two hundred miles south of the Peace River valley.

The pioneers were greatly disheartened. Twenty or thirty years might pass before another railroad would go that way. They now saw they might live all their lives in that remote region with no means of transportation southward, save by horse teams.

The Masterman boys—Quinby, Jesse and Welcome—were not the kind of young men to settle down with so cheerless a prospect for the future. They sold their stock, abandoned their new farm and, after returning to Edmonton, journeyed to Prince Rupert. Following the building of the railway, this young city of the Pacific was then enjoying a grand "boom," as its seaport. All real estate was soaring in value. My young kinsmen promptly invested in house lots, but were caught on the reflux wave of the boom, following the World War, and lost rather heavily.

Still undismayed, however, they voyaged on across the inlets to Skidegate Harbor, in Queen Charlotte's Islands where, having yet a few thousand dollars left, they purchased a small steamer "Whaler" and embarked in the business of hunting "sulphur-bottom" whales—and at present are making a great success of it, clearing as much as twenty thousand dollars from a single cruise of a week outside the Islands! So much for youthful energy, courage and a determination not to lose out in the battle of life.

The case of the Woodbridges was somewhat different. They were "Americans," as settlers in the Northwest who hail from the United States are commonly called; and at the time they migrated north, the family consisted of the father, Freeman Woodbridge, a daughter Milly, her older brother Winthrop, and for a time a kinsman on the maternal side who was generally spoken of as "Uncle Horace."

THEY came originally from Hartford, Connecticut. But they had lived in Iowa for several years, afterwards in North Dakota, and later still, in the state of Washington.

Freeman Woodbridge—as once mentioned in our Tales of the Peace River Country—was one of those peripatetic geniuses whose mission seems to be to wander through life looking for water powers and building mills on them. As a boy in Connecticut, he had set up water wheels on a brook; and as a man and millwright, he had a record of two grist mills in Iowa, three sawmills in Dakota, and two or three in Washington: a mechanical genius, yet possessing "no head for business." Always some financial disaster drove him on, to look for new mill sites. Some hard creditor invariably got his mill from him.

From Washington he migrated to British Columbia and finally reached a remote creek near the Peace, with the firm conviction that lumber was sure to be in great demand for the new houses of the future settlers.

As compensation, perhaps, for his many disappointments in life, fortune had given him a wife who had been his good genius, comforter and caretaker. She had perished, however, in a flood that swept away their last mill in Washington. Her daughter, Milly, was much like her—prudent, practical and courageous in adversity. In fact, Milly, after her mother's death, was the mainstay of the family; she it was who held it together and kept things going. Several of her adventures in this

new land showed this characteristic of her nature; how their shack was robbed of the "Rosomaka"; how the "Chinook" came; how their Jersey, "Brighteyes," which the Mastermans gave them, ran away; how "Barty," a blind bear, came to be a pet with them, and how Winthrop found "Old Peregrinations"—a horse which miners on their way to the Klondike had turned adrift, years previously.

When the writer had the pleasure of meeting the Woodbridges, shortly after they settled on the Peace River, Milly looked to be a strong, healthy girl of fifteen or sixteen. As I remember her she had clear hazel eyes, abundant light-brown hair, lips often rising at the corners in an engaging smile and a complexion brightened by exposure to outdoor air and sunshine. In short, she seemed of a happy disposition and very attractive, so much so that the evident admiration of my young cousin, Quinby, was easily understood.

Winthrop was very little like Milly. He much resembled his father. He liked to work in the mill and tinker with machinery; but what he really loved was wood carving, making homely wooden utensils and even images and busts. He had a knack and a gift for that sort of thing.

The creek where Freeman Woodbridge had succeeded in building a sawmill was a long way from the wheat farm where the Mastermans had settled. But they were neighbors in a pioneer sense,

The Cheerful Plowman

PLANT A TREE NOW!

PERHAPS you neglected in pioneer days to set out some trees by fences and ways; in the rush of those times with the wolf at the door, first thought was of food and of shelter and store, while beauty and sentiment, said 'tis to say, were forced to bide time till a happier day; but it's not too late, so go make you a vow, go buy you a sapling and plant a tree now.

Perhaps in the hurry of building your shed, of building a shelter for table and bed, you didn't have leisure for planting a pine, a spruce, or a fir on the boundary line; perhaps in the hurry of breaking the sod and wringing a crop from the glebe and the clod, you had not a moment for setting a birch by the side of the road where the robins could perch; but it's not too late, so go make you a vow, go buy you a sapling and plant a tree now.

Perhaps there were illness in those early days, when hardship appeared in a thousand of ways, perhaps there was death and a burial lot and grief at its sternest that had to be fought; perhaps the crops failed and the larder was bare, perhaps an old ladder was used as a stair; perhaps there was flood, or heat, hoppers and hail that crowded out thoughts of a grove in the dale; but it's not too late, so go make you a vow, go buy you a sapling and plant a tree now.

Perhaps things went well from the very first year that you broke up the soil in the valley lands here and wealth came in quickly and brought you a thirst for money and power that was lacking at first; perhaps on acquiring your mind has been set until not a tree has been planted as yet; perhaps in your eagerness, greediness, pace, you've crowded all sentiment out of the race; but it's not too late, so go make you a vow, go buy you a sapling and plant a tree now.

J. E. T.

and visited to and fro at times, particularly the young folks. It was quite plain, indeed, that a warm attachment had sprung up between Milly and Quinby. When, therefore, the Masterman boys gave up the idea of farming there and resolved to migrate to Prince Rupert, they were very desirous of having the Woodbridges go with them. Milly and Winthrop wished to do so. The obstacle was their father.

Freeman Woodbridge still believed in his mill. He and Winthrop were at that time sawing about a thousand feet of lumber a day; and despite all arguments and probabilities to the contrary, he still believed that a considerable sale of lumber could presently be made. "People will soon be settling all round here," he said. "They will want houses. Lumber will sell."

He obstinately refused to leave. His health had been failing of late; he was coughing badly at times. "I never intend to leave here," he constantly exclaimed when Milly sought to convince him; that they would better accompany the Mastermans. "I've been moving all my life," he said. "I'm tired of it. Here I stop."

No doubt this decision of Freeman Woodbridge was a greater disappointment to his daughter than any one knew, save herself. But loyalty to her folks was one of the sterling traits of Milly Woodbridge's character. She acquiesced in her father's determination to remain, although her own better judgment convinced her that it was a mistake to do so.

Lonesomeness fell heavily upon them, after the Mastermans moved away, upon Milly especially. Months dragged by. No one came to buy lumber. Such settlers as remained were poor and built their houses and barns of logs. The Woodbridge board piles grew in number; but only two thousand feet were disposed of in six months, and these for potatoes instead of cash.

Cold weather and short days came on; they passed a deplorably hard, lonely winter. No mail now reached them. They had heard but once from the Mastermans. It was Quinby who wrote again urging them to abandon their place and come to the thriving new seaport on the western ocean;—the Prince Rupert boom was then at its height.

Freeman Woodbridge, however, remained fixed in his resolve to live and die in the Valley of the Peace; and throughout the summer that followed he and Winthrop went on sawing lumber—which no one was likely to buy. Neither he nor Winthrop possessed much aptitude for cultivating crops, or they might have raised a field of wheat, potatoes and garden vegetables. For short as are the summers there, the warm, long days of June, July and early August force all vegetation forward at a pace far more rapid than in more southerly latitudes where the nights are longer. Up there at the summer solstice the sun shines twenty-two hours daily. Seventy-six days suffice to raise a crop of wheat.

Early in June Milly planted a garden and had new potatoes in August, also turnips and lettuce. A single acre of wheat would have stood them in good stead for the winter; but throughout the season Freeman and Winthrop went on sawing boards.

THE summer crept by and winter came on apace. No lumber had been sold during the last six months; and now their sole remaining money had to be expended for food supplies, mainly canned goods, at the Hudson Bay Company's store at Fort St. John, and they had to make a boat trip on the river to fetch it home. During that summer, too, Uncle Horace, grown discouraged by the bad outlook, had left them and returned first to Edmonton, and thence home to Connecticut.

One can hardly imagine a gloomier situation than that of the Woodbridges through the ensuing cold season. Influenza had penetrated even to that isolated region. Freeman Woodbridge was ill of it from December till March and his cough got worse. Medical aid there was none within seventy miles. Days of painful brooding oppressed the poor man; and to Milly and Winthrop, who saw no likelihood of improvement in their affairs, those long weeks of wintry solitude and darkness must have been inexpressibly dreary.

Once during the winter Milly had ventured to ask her father whether it would not be well, in view of the lack of market for his lumber, to change their plans and go to reside in a less solitary part of the world. At first he was angry, then bade her respect his decision. "I hope you will not bring this subject up again," he said shortly. "I shall never change my mind," he added.

(To be continued.)

The Farm Home

Sunny Monday with Modern Washer

9 p. m. Sunday.—Around the piano with Pa and the children singing hymns.
6:30 a. m. Monday.—Baking waffles and eating soft boiled eggs at the daily breakfast gathering with all the family.
7 o'clock.—Putting the farm kitchen in order for the laundry work.

Sorting the Wash

7:30.—Starting the motor that makes washday a day not to be dreaded, whether electricity or gasoline does the work. Home-maker goes over rest of wash, removing stains and mending slight tears.

7:45.—A second tub of wash is started, and Sunny Monday rinses and hangs out the first clean sweet clothes.

8:15.—The third wash is started, the second rinsed and hung in the air.

8:45.—The men's overalls, etc., are now given their turn in the motor washer, while our happy Sunny Monday finishes rinsing and hanging all clothes previously washed. If the day is bright and airy the lines are folded, ready for ironing.

9:15.—The last dirty clothes are clean. All are out flying in the breezes. The kitchen is quickly put to rights and Sunny Monday steps gayly out to the letter box and may now glance over the morning paper.

10 o'clock.—In Sunny Monday's house, peace and order reigns. The usual daily picking-up is done, beds are made, baby has had his bath and plans are well under way for the noon-day meal.

11 o'clock.—More clothes are ready to be removed from the line and folded to put away or to iron.

12 o'clock.—Smell the tapioca pudding fresh from the oven, and look at those huge baked potatoes, that crispy salad and the cream of spinach soup.

1 o'clock.—Finds our Sunny Monday with dishes scalded and in the drainer, the tots having a little frolic before naps, and the last clothes being gathered in.

The rest of the day in the Sunny Monday home is one among the flowers and very early garden things; the little chicks are better for having had her several visits, and her family is happy.

This Week's Prize Cake

Husband's Delight

FOUR egg whites, one-half cup butter, one and one-half cups sugar, one cup sweet milk, two and one-half teaspoons baking powder, two cups flour, one teaspoon vanilla.

icing: Three-fourths cup milk and butter, three-fourths cup sugar, one-fourth cup nut meats, four egg yolks.

Boil the sugar, butter and milk until it threads when poured from a spoon. Then add the chopped nut meats, remove from the fire and slowly add the egg yolks well beaten. When cool ice the cake. To chop the nuts lay on a piece of bread or waxed paper and use a knife. I find if they are put through a food chopper they are greasy. Mrs. Warren A. Cope, Pennsylvania.

Note.—This is a lovely cake and very pretty for your Easter table.

Timely Tips

FEED-SACKS supply me with towels, I ravel, bleach, cut in two so that one side is selvage, and hem, and firmly sew loops on each end. If I have tape I use it. Otherwise I make a long strip of muslin with doubled-in edges, and use it for the loops. We aim to have a fair supply of Turkish towels for "Sunday" but ordinarily we have these I have described. They wash easily, iron very smoothly, and if you are in a hurry they can be tak-

en off the line carefully, folded, and not ironed at all.

And while I am on the subject of saving on the ironing I will tell you that I fold my sheets with precision, and lay them on the table over the ironing-blanket, and by the time a few articles are ironed the sheets begin to come off, one at a time, and as I fold them away for the shelf, they look scrumptious, if you know what that means.

As I iron I lay out the things that need mending, and that comes next in my list of duties. All I possibly can, I do on the machine. I split the legs of overalls, set the patch neatly, then sew up the leg again with as small a seam as possible, and presto, the deed is done. Sometimes I merely sew on the patch on a fairly good garment, and later hem it down by hand. But if I did not go right after the missing buttons, torn button-holes, barbed-wire rents and heelless socks, I am afraid I would postpone it till that more convenient day that never comes. This spring I have been having an orgy of turning frayed collars on shirts, not forgetting to neatly catch down the worn edges after I turn them underneath, or the iron will catch its nose in them.

Nellie R. Nesselroede.

The Hostess Gift

IN our family circle we have a very pleasant custom, at least we think it is, of buying a gift for the hostess who entertains the clan at the yearly reunion. It is no small matter to have the house in good order, tables provided for the lawn, coffee made and the various chores done before the gathering, to say nothing of the cleaning up afterwards.

A collection is taken to defray the expenses of postage and some other little items, and then the rest is placed in the hands of a committee who carefully investigate what would be pretty, appropriate and well liked by the hostess. It may be a small piece of furniture, books, a lovely piece of table linen, an ornament or a mirror, but always it is something that will remind her of the good time in her home, and the appreciation of the rest of the family.

Hilda Richmond.

Let Us Help You

Have you ever seen the farm bulletins 1497 and 1474? The former is on Methods and Equipment for Home Laundering, and is full of helpful ideas. Bulletin 1474 discusses Stain Removal and gives a variety of ways to remove every sort of stain from every kind of fabric. Both are free from U. S. Department of Agriculture, Washington, D. C.

If you would like some more literature full of suggestions as to methods, soaking, softening water, better rinsing, washing special fabrics like woollens, rayons, silks, etc., send a self-addressed envelope (stamped, too) to Home Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa., and your Blue Monday will be a thing of the past.

Rub-a-Dub Makes Mundy Blue

9 p. m. Sunday.—Out in the shed (part of the house) putting clothes to soak in tubs on a wash bench.

6:30 a. m. Monday.—Hurrying the half-fed youngsters out of the crowded kitchen to make room for the bench and its laundry tubs.

7 o'clock.—Pumping and lugging water from the outdoor well to fill the tubs and boiler.

Sorting the Wash

7:30.—Rub-a-dub-dub at the old wash tub.
7:45.—Rub-a-dub-dub at the old wash tub.
8:15.—Rub-a-dub-dub at the old wash tub.
8:45.—Rub-a-dub-dub at the old wash tub.

Mundy Blue is hurrying to rinse a few sheets and get something on the line. The work of washing stops when she leaves the board, for both women are mothers of four young children not of a helping size.

10 o'clock.—More dreary rubbing, and wringing, and hanging. Children growing fretful, mother getting very tired and cross. No morning housework has been touched; no thought of a bath for Junior, no bite for noon in the oven.

11 o'clock.—The baby does not feel right, something is missed, and he does not sleep in his usual nap period. His perpetual crying upsets the whole family.

Since the father and hired man must be fed at twelve, Mundy Blue leaves her last lot of wash to soak while she warms over a few potatoes and some left-over Sunday meat and vegetables. And poor, tired Mundy Blue, with a group of whining children round her knees has more farm socks and overalls to rub, dinner and breakfast dishes to clear away, the kitchen and porch to scrub. This indeed is life in many homes without a motor washer.

When "Mother's" blue, the world is too!
She'd be a good sport—if she ever got through.

Perennials

MORE and more our busy farm women are thankful for the old-fashioned garden of perennials; the spice-pink, narcissus, lilies of the valley, peonies, columbine and a dozen others known only to the lovers of the things that endure. First year flowers from spring plantings of perennials are rarely possible even with the careful handling of the roots. The life germ seems to need a year's growth to adjust itself to any change.

Fall tree planting shows a like need, and advantage that points the way, but the gathering and saving of summer crops must have first place on our autumn programs and this fact does hinder fall planting of perennials.

The fact of our need of dollars, we are learning, must be balanced by the stern fact that great ends are rarely gained without such enrichment of the spirit as only a growing love of beauty can provide. Only a great desire, a great hunger can lift human aims to ever higher levels. We cannot desire or hunger for that which we have never seen or known. Herein is a great argument for beauty in the daily life, in the home.

Even a score of the first spring flowers, usually narcissus, will fill a living room with their rich fragrance as well as a real delight in their beauty. Perhaps a winter as generally trying as the one just past prepares us for a keener appreciation of spring-time beauty. Certain it is my narcissus never seemed so beautiful, so fragrant as this year. My best wishes for every farm home is an old-fashioned garden of perennials.

Hepsy Neff

No. 6801.—Misses' dress. Cut in three sizes: 10, 12 and 14 years. A 12-year size requires 2 1/2 yards of 39-inch material. To finish with bias binding requires 5 1/2 yards of 39-inch material. The belt of contrasting material requires 1 1/2 yards 39 inches wide, cut crosswise. Price 15c or two for 25c.

No. 6794.—Ladies' dress. Cut in eight sizes: 26, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. A 46-inch size requires 4 1/2 yards of 39-inch material. For contrasting material 1 1/2 yards 39 inches wide cut crosswise is required. Price 15c or two for 25c.

No. 5909.—Ladies' apron. Cut in four sizes: small, medium, large and extra large. A medium size requires 2 1/2 yards of 36-inch material. For binding as illustrated 7/8 yards will be required. Price 15c or two for 25c.

No. 6812.—Girls' dress. Cut in four sizes: 8, 10, 12 and 14 years. A 12-year size requires 3 1/2 yards of material 39 inches wide. The belt of contrasting material requires 1 1/2 yards 39 inches wide cut crosswise. Price 15c or two for 25c.

No. 6837.—Ladies' apron frock. Cut in four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 3 1/2 yards of material 35 inches wide. For collar and sash of contrasting material 1/2 yard is required cut crosswise. The width of the frock at the lower edge with fullness extended is 2 1/2 yards. Price 15c or two for 25c.

No. 6817.—Girls' dress. Cut in four sizes: 2, 3, 4 and 5 years. A 3-year size requires 1 1/2 yards of material 32 inches wide. For contrasting material 1/2 yard cut crosswise is required. To finish with bias binding requires 2 1/2 yards 1 1/2 inches wide. Price 15c or two for 25c.

No. 6414.—Lingerie set for junior and miss. Cut in four sizes: 14, 16, 18 and 20 years. A 16-year size requires 2 yards 40 inches wide. Price 15c or two for 25c.

No. 6413.—Ladies' slip. Cut in four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 2 yards of 40-inch material. Straps of ribbon will require 1 yard. Price 15c or two for 25c.

No. 6418.—Girls' dress. Cut in four sizes: 4, 6, 8 and 10 years. A 10-year size without sleeves, requires two yards of material 36 inches wide or wider. If made with sleeves, as shown in the small view, 2 1/2 yards will be required. To finish neck and armhole edges as illustrated requires 4 1/4 yards of bias binding. Price 15c or two for 25c.

No. 6226.—Ladies' apron. Cut in four sizes: small, medium, large and extra large. A medium size requires 1 1/2 yards of 36-inch material, together with 8 1/4 yards of bias binding. Price 15c or two for 25c.

No. 6005.—Ladies' undergarment. Cut in four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 1 1/2 yards of 36-inch material if made with shaped shoulders. If made with camisole top, 1 1/2 yards is required. To trim as illustrated will require 4 yards of lace banding or edging. Price 15c or two for 25c.

HOW TO ORDER

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Five cents less is not always five cents saved!

The money you "save" by buying cheap flour is not always money saved.

For one thing, more than your whole saving can be wiped out by one baking failure. Again, the cheaper flour may not go as far. It may not give as fine a flavor to your foods. And it may not work successfully with everything you bake.

In the long run, while Pillsbury's Best Flour may be priced at a few cents more, it usually proves to be most economical. Pillsbury's Best is dependable—it will not cause a failure. Pillsbury's Best is milled from rich wheat—it goes farther, and gives a finer flavor to your foods. Pillsbury's Best works perfectly with anything you bake—bread, biscuits or pastry. It may cost a few cents more, but millions of women can tell you it's money well spent!

Pillsbury's Best Flour

A rich flour, milled for finer flavor and more certain success in all your baking—bread, biscuits and pastry

The trip to town

ON SATURDAY NIGHT the farm family drives to town. Boys and girls to the movies. . . Young fellows for a date. . . Dad and mother to purchase the weekly provisions.

But buying isn't such hard work as it used to be. It's a real pleasure trip, indeed. Goods come in packages and each sack or carton has a label. Mother knows what she wants. Father has his mind made up too. Under the farm account book at home they keep a "needed" slip. There all goods to be bought are listed. So are the brands to buy. Shoes, breakfast food, and syrup, gloves, tires, overalls.

If you're a practical farmer, you have learned that you can't spend valuable daylight hours gossiping at the crossroads store, or arguing with the grocer. You realize the advantages of reading advertisements, for you can trust advertised products and the stores that sell them.

The dealer who sells an advertised product does not have to resort to clever salesman's tricks. He sells his merchandise for what it's worth. He knows that you've had a chance to read about it, to compare it with other lines, to come to him with your eyes open.

Advertised goods have the public's approval. Accepted as standard, they remain on the market. Advertisers know that their products must be worth the money asked, or otherwise the public won't buy them.

Read the advertisements in this farm paper, because it will save time and get you greater value per dollar.

Remember this: When chicks are six weeks old they still have a lot of growing to do. They need a growing mash that will keep them growing and develop the body capacity and vitality for heavy egg production. Do not take chances with an unproved feed.

Seven years ago Larro Growing Mash was merely one of the feeds under test at the Larro Research Farm. Test followed test and results were checked and double checked for three years with more than 60,000 birds before it was offered to poultrymen.

Since then the number of birds raised on Larro Growing Mash has climbed into the millions. Thousands of poultrymen have checked and double checked its results against other feeds and have found that **Larro Growing Mash grows the best birds and the most profit.**

Larro feeders remain Larro feeders because every sack of Larro checks to the same high standard—it always contains the same uniform balance of ingredients and is always the same in feeding value.

When your chicks are six weeks old feed them Larro Growing Mash and Larro Growing Grains—then they will grow that body capacity needed for heavy egg production.

You cannot afford to use your farm as an experiment station—That's why feeds are constantly being tested at the Larro Research Farm. When you buy Larro Feeds you eliminate guesswork.

Walter M. Robinson is one of the many poultrymen who have built up outstanding flocks on Larro. "Since we adopted Larro, it has been a case of continual improvement in our White Rocks. It is always a satisfaction to see a customer of ours feeding Larro to the birds he gets from us. We know then that they will do their best. Larro Growing Mash is certainly a profitable investment to a poultryman and so are your other feeds. I have tried a good many brands, but Larro is the best."

Walter M. Robinson
Benjamin Farm, Middleton, Mass.

Nest Box Notes

By R. L. SCHARRING-HAUSEN

AT this season of the year, when most of us are brooding chicks, troubles are bound to arise, and one of them is picking. Sometimes this causes serious losses in chick flocks, and even when not serious chicks that are picked are usually stunted if they live, and each death means the loss of a broiler or a pullet.

It has been pretty well established that picking is not the result of any deficiency in the ration, but rather a vicious habit, which, once started, is hard to control. Prevention is the best. Among the causes of picking are such things as lack of water or feed, too high temperature in the brooder house, and crowding. Proper management will do a lot to eliminate picking.

ONCE picking has begun, all injured chicks should be removed from the flock at once and put by themselves until the wound has scabbed over. Daubing with pine tar, roofing paint or one of the patent antipick remedies on the market will sometimes prevent further picking, but is not always effective. The house may be dimmed by curtaining the windows or painting them with a blue wash, and the habit may be further controlled by putting half a head of cabbage in the pen for the chicks to pick at instead of at each other.

PICKING often becomes serious in laying flocks as well, and I have a number of letters at this time from readers asking what to do for this trouble. It seems that lack of water or crowding may start this vice in older birds, and there is also evidence that when birds are fed grain heavily, especially corn, they may become too fat and for some reason begin to pick at each other's vents. I have also noticed that birds which have not been laying well during the winter sometimes suffer prolapsis when the spring urge causes them to lay, and such birds are of course attacked as soon as the other hens see the protruding membranes.

Whatever the cause, this picking gets to be a vice, and some individuals contract a vicious habit which starts them to picking for no reason at all. Sometimes a little watching will disclose such birds, and they should either be removed from the flock or have the upper part of the beak trimmed down to the quick so that they cannot pick.

AMONG young birds crowding is one of the worst things that can happen at this season, and is one of the commonest reasons for chick flocks going bad. When the young chicks are first put out they don't take up much room and we are likely to put more than we should in a pen. They increase in size so rapidly that the house is soon overcrowded, and then they trample all over each other, pile in the corners, and because there is not enough room at the hoppers and drinking fountains, the weaker ones are pushed aside and do not get enough feed and water, so that they become stunted.

AS soon as it is possible to tell the cockerels, it is a very good plan to separate them from the pullets; it is a good plan to put them by themselves. They are the stronger birds and push the pullets away from the hoppers and generally make a nuisance of themselves, so that the pullets will do much better alone. When this separation is made, it is a good idea to give the young birds more room. I recently separated my oldest young stock, putting what had been in three pens into four pens.

SOME people in starting chicks put them on bare sand under the hover, which I think is one of the worst things that could happen. If this is done, and the chicks are not

fed at the same time, they will eat so much sand that they get packed solid from stem to stern, and many of them will die.

There is pretty good evidence that chicks may be fed as soon as taken from the incubator, despite the old recommendation to starve them up to 72 hours before feeding. Whether they are fed at once or later, an abundance of sand at the first is not the proper thing.

IN starting young chicks, I make a mixture of mash and chick grain, sprinkle a little grit over it, fill the drinking fountains with lukewarm water, and put the feed out in flat pans before the chicks are put out. I never have any trouble from chicks eating sand or litter, and they certainly do well. I have used peat moss for brooder house litter for a number of years, and never had a bit of trouble from it, although some people say the chicks eat it. It has been my experience that if the chicks have feed and water before them they will not eat litter.

IF chicks are to be held before feeding after being taken from the incubator, chick shipping boxes are the best place to put them until they are ready to be fed. The same is true if they are to be held after being received from the hatchery. The boxes should be kept in a dark, comfortable place free from drafts, but should not be put in the brooder house, as it is too warm there with the stove going, and the chicks will be overheated or smothered.

IN feeding small chicks grain it is much better to feed it in a trough or tray than to scatter it in the litter. A good feeder can be made by taking a piece of eight-inch board as long as convenient, and nailing plaster lath around the edges so as to form a tray about an inch deep. These feeders can be made of scrap lumber, and there should be several of them in each pen. If grain is fed on these, there should be very little wasted, as is so often the case.

I AM not in favor of using fiber board or sheet metal to confine the chicks near the brooder for the first few days. If the brooder gets too hot the chicks are bound to suffer. Small mesh wire is much better, as the chicks can get some fresh air if they need it. If the house is properly constructed, there should be nothing to fear from floor drafts; and if it is not, the chicks should not be put into it until everything is right.

Range Paralysis

My hens are dying and are apparently healthy. Their combs are red and they eat well, but they seem to lose the use of their legs. They fall around when they try to walk and finally get so they can't walk. Mrs. John T. Jones.

THE symptoms you describe are those of range paralysis, for which, I am afraid, there is no certain remedy. Poultrymen in New England have been using a preparation known as enteritis powder for this trouble, and some of them report good results.

I think it would be advisable to separate any birds showing paralysis from the rest of the flock, and to give the house a thorough cleaning, using any of the poultry disinfectants that are for sale liberally.

A Triple-Yolked Egg

YESTERDAY one of my Plymouth Rock pullets laid a very large egg. When broken in the frying pan it showed three fully developed yolks. This is the first instance of the kind I have ever heard of. Are triplet eggs very rare? W. K. Hall

Trend of the Industry

By H. C. KNANDEL

WHAT is the present trend of the poultry industry? With eggs selling for less than at any time in the last ten years; with at least 25 per cent more chick orders booked in advance over last year, with broilers, roasters and turkeys selling for less than the average for several years past; what is the future? Prophecy is bad business. It is no business in which a poultry editor should engage—at least not this one. There are, however, certain facts which must be carefully considered and it is on these facts that one can make his future plans.

As has been said, baby chick orders are far ahead of those of last year. That looks hopeful, but these orders were booked months ago when egg prices were good. There is always a correlation between egg prices and baby chick orders.

Poultrymen have seldom received such good prices for eggs over a long period of time as those of last year. August to January of this year. Good early hatched pullets were rather scarce. The supply of good, fresh eggs was readily absorbed by the public. Hence the relatively high price of fresh eggs. Now what has recently happened? Egg prices have tumbled and tumbled badly.

Early Broilers

Many poultrymen during the winter months have endeavored to cut down overhead expenses of brooding equipment by raising early broilers. This is always a precarious job. The year it has proved less remunerative than for several years. The reason is simple; demand has not kept pace with supply.

With more chicks being hatched this year than last, it would seem reasonable to suppose that more pullets would be raised and more broilers placed on the market. What will this mean? It seems inevitable that poultry products like dairy products during the present year will be relatively low in price.

In the country north of us, steady progress has been made over a period of years in the standardization of Canadian eggs. Housewives throughout the provinces of Canada, when they buy eggs, buy them on grade. Farmers and poultrymen sell their eggs to wholesalers and retailers on grade. The result has been that Canadian eggs bring a high price. But most important the annual per capita consumption has steadily increased until today Canadians are eating two eggs to our one. What a change there would be in the poultry outlook in the United States if egg consumption were to double!

National Egg Week

For several years the National Poultry Council has fostered National Egg Week during the first week in May. Posters and stickers are supplied at nominal cost. The former are placed in conspicuous places about towns and cities and bring to the attention of city folks the food value of eggs. The small stickers, which tell the same story, can be placed on baby chick boxes, egg cartons and letters. Every farmer and poultryman in the United States should help foster this movement. It is a good investment for him personally.

Should chick production be increased the number of pullets reared will probably be the greatest in the history of the country. It will, therefore, be necessary to cull rigidly and thoroughly every individual which does not exhibit the potential ability to lay a profitable number of eggs. During the next twelve months the number of eggs a hen must lay to be profitable will be greater than for any year during the past decade. The final outcome will mean that the poorly managed flock will be eliminated and the better trained poultryman will go on his way rejoicing. The poultry business has always righted itself. It will again but it will do so a little more quickly if every one does his part.

50,248 eggs from 910 April-hatched pullets by midwinter

This flock of pullets was used in an experiment conducted on a Northern Ohio farm under the direction of the Research Farm of Dr. Hess & Clark, Inc., Ashland, Ohio. Results given in detail below.

Without any special care or attention, a pullet will lay the first spring following her hatching date. It's only natural that she should do so. But the pullet that lays her first fall and winter... she's not fulfilling any command of nature. What she is doing is repaying her owner for the special care and attention he gave her while she was a baby chick and during her pin-feather days.

THOUSANDS of pullets that lay the first fall and winter are repaying their owner for giving them Dr. Hess Poultry Pan-a-min regularly. For many poultrymen have learned to rely on Pan-a-min to grow and develop their pullets into early profit. In the picture above is a typical Pan-a-min flock. Starting with 2000 day-old chicks early in April, 3 pounds of Pan-a-min was mixed with each 100 pounds of starting mash to build up vitality and to help the chicks avoid the little-chick ills. Pan-a-min was mixed with all their developing mash, and finally, in every pound of mash fed to the layers.

At 10 weeks, 1975 of the original 2000 chicks

were alive and vigorous. Only 25 had died. The cockerels were sold... 987 pullets remained.

On Sept. 1st, 77 culs were cut out—leaving 910 pullets. These were placed in laying quarters.

In September these pullets laid 2698 eggs. And by the first day of February—midwinter—they had laid 50,248 eggs that sold for \$1959.42.

Charging all feed consumed from the beginning, the original cost of chicks, fuel for brooding, cost of Pan-a-min used—crediting eggs, cockerels and culs sold—this flock has produced \$906.66 over and above all expenditures.

Allowing credit for 910 hens valued at \$1.50 each, there was a net profit on the first day of February—less than ten months from the day the chicks were hatched—of \$2371.66—before the average flock had started to lay in earnest.

If you expect your pullets to start laying ahead of the crowd, you'll have to commence now to speed them along to early maturity. Start now feeding them Dr. Hess Poultry Pan-a-min.

Remember, Pan-a-min does not take the place of feed. But no feed can take the place of Pan-a-min. Dr. Hess & Clark, Inc., Ashland, Ohio.

53 More Bu. of Potatoes Pay for Spray Material and Show Extra Profit..

CHALLENGED to make a convincing test of Pyrox in comparison with bordeaux, George S. Ranck, of New Holland, Pa., made such a test on his farm. The results showed that the acre of potatoes sprayed with Pyrox yielded 53 bushels more than the acre sprayed with bordeaux. The fine Pyrox spray gave better protection against blight. Mr. Ranck writes:

"In discussing Pyrox with your dealers, A. B. Groff and Son, at New Holland, a challenge developed which resulted in my making a test of Pyrox and home-made bordeaux sprays on my farm this past season.

"A two-acre plot with uniform soil was selected and one-half was sprayed with bordeaux mixture 8 times and the other half with Pyrox 8 times. All other conditions—preparation, seed, time of planting, and cultivation—were the same.

"Potatoes from test rows in each plot were weighed at digging. The acre sprayed with Pyrox yielded 53 bushels more than where home-made bordeaux was used, the yields on the two plots being 337 bushels for Pyrox and 284 for the bordeaux mixture.

"During the growing season the fine Pyrox spray gave greater protection against blight, as all the leaf surface was covered. Better protection, increased yields per acre, and lower cost of production all help to make greater profits."—GEORGE S. RANCK.

Another Grower Gets \$97 per Acre Extra Profit

Another Pennsylvania grower who has made extra cash from potatoes by using Pyrox is Mr. Miles B. Landis, of Lancaster, Pa., who got \$97 per acre increased profit with Pyrox last season. He writes:

"Before this year I have al-

Mr. George S. Ranck of New Holland, Pa., exhibiting Pyrox-protected potatoes which yielded 53 extra bushels per acre.

ways used a regular bordeaux mixture. This year I tried Pyrox and certainly feel well satisfied with it because of its time and labor saving qualities. I further believe that I get a better control of disease and insects with Pyrox.

"The quality of my potatoes this year was very high. I am getting a premium of ten cents per bushel over the regular price here. I figure that my increased yield due to Pyrox was 45 bushels per acre."

MILES B. LANDIS
November 5, 1929

These big extra profits are possible because Pyrox, the scientifically-prepared all-purpose plant spray does three things at once. It kills bugs, prevents blights, and other diseases, and stimulates plant growth. Reduces production costs. Does away with the costly labor and doubtful results of home-made spray mixtures, and eliminates all danger of "burning" and other damage from improperly mixed chemicals. Easy to use. Gives the finest mist—will not clog nozzles. Sticks like paint to plants. Now priced lowest in 31 years. Write us or ask your dealer for a copy of the free Pyrox Spray Guide.

Air Transport for Poultry

It is understood that the leading air services are making arrangements that will enable them to deliver birds from the Continent to the Crystal Palace, London, when the Fourth World Poultry Congress is ready to take delivery.

The ordinary means of transport, though excellent and carefully thought out, can hardly compete in point of speed or directness with the airplane. Many owners of valuable birds may welcome the chance of sending their exhibition stock direct in the carefully designed cases that the air services will supply, and we may take it that birds sent by air will arrive at their destination in the pink of condition.

A Step Forward

The fault of the average agricultural or livestock show is that it develops very largely on the utility side. A collection of sheds, marquees and rough outbuildings, set up in ordered disarray, may serve all the purposes of responsible parties and call for no criticism. But the Fourth World Poultry Congress, which is also the first to be held in England, must have a better considered setting, and with this end in view steps are being taken to lay out the buildings, grounds and exhibits in harmony with the grace of design and beauty of embellishment which is associated with the Crystal Palace.

A. Fraser.
Kent, England.

Poison Ivy, Poison Sumac

(Continued from page 8.)

In the staghorn and the smooth sumac the leaflets are toothed while in poison sumac there are no teeth on the margin. The characters for distinguishing the four species which might be confused may be summarized as follows:

1. Rachis or stem to which leaflets are attached winged—Rhus copallina.
2. Rachis not winged
 - a. Leaflets with teeth—Rhus typhina and Rhus glabra.
 - b. Leaflets not toothed—Rhus vernix.

Poisoning from poison sumac is caused in the same way that it is by poison ivy, therefore, the same preventive measures and curative remedies are advised. No one should be careless or negligent about poisoning from poison ivy and poison sumac, for death in a few cases has been the result and some people who have been immune have suddenly become susceptible. Only he who has had a bad case of poisoning knows how intense is the suffering.

More Logging Frolics

(Continued from page 5.)

the timber remained standing until this day, unmolested by the ax of the settler, it would represent more money value than does the cleared land with all its improvements. But not in over fifty years has any such wasteful clearing been indulged in. The last in this locality was in 1878 when a tract of nine acres was "chopped" and cleared, most of the labor being performed by the writer, and but a small percentage of the growth was used for any purpose whatever. Since growing older, I know better.

The Easy Way to Kill Lice on Poultry

No matter how big the flock or how lousy, only a small paint brush, a can of "Black Leaf 40" and a few minutes time for "painting" it on top of the roosts are required to rid an entire flock of body-lice. Do away with old laborious and disagreeable methods of dusting, dipping and greasing!

Paint the Roosts Just Paint the Roosts with "Black Leaf 40"

About a half hour before fowls perch, "paint" "Black Leaf 40" on top of roosts. When fowls perch upon roosts that have been so "painted", fumes are slowly released that permeate the feathers, killing the lice. The treatment is so easy, effective and cheap that poultry owners need never be bothered by lice on their flocks. Think of the time and labor and expense that this method saves! There is no individual handling of fowls, no individual handling of roosts. "Black Leaf 40" is sold by poultry supply stores, \$1.25 size treats 100 feet of roost. Ask your dealer or write us.

for Economical Transportation

A stronger, more powerful SIX-CYLINDER TRUCK -at greatly reduced prices!

Vitaly improved in every feature that makes a truck desirable for service on the farm—yet selling at greatly reduced prices—the new Chevrolet Utility 1½ Ton Truck is winning overwhelming preference in rural communities everywhere.

The famous Chevrolet 6-cylinder valve-in-head motor has been increased in capacity to 50 horsepower—for extra pulling power on hills and bad roads—as well as faster pick-up.

New bronze bushed pistons—a new hot-spot manifold—and a heavier 48-pound crankshaft assure greater smoothness at every speed, less destructive vibration, and consequent longer life.

A bigger, stronger, more powerful rear axle makes Chevrolet stamina, reliability and durability more pronounced than ever before.

And, most impressive of all, Chevrolet's amazing fuel economy has not only been preserved—but maintenance costs have been reduced to an even lower level!

Add to all these outstanding qualities the time-tested efficiency of such famous Chevrolet features as the rugged over-size frame, the perfected 4-speed transmission, the powerful non-locking 4-wheel brakes, the full ball bearing steering mechanism—and you will quickly realize why farmers are turning with high enthusiasm to this latest Chevrolet achievement.

See your nearest Chevrolet dealer today. Get a trial load demonstration of this remarkable truck. Learn for yourself how much more it gives you—in power, in strength, in capacity and in performance—for every dollar you pay!

A SIX IN THE PRICE RANGE OF THE FOUR

WHAT I LEARNED FROM TEN POST CARDS

"NEVER before did I get such a big return on an investment," writes a farmer friend. "I wrote to ten advertisers who offered interesting and valuable booklets. Here's how I benefited.

1. "First of all a book on rearranging the farm gave me an idea on planning my fields for better crop rotation and greater convenience.
2. "One of my postcards brought back a book that I wouldn't sell for \$10. It told me how to raise chicks for the early broiler market.
3. "Just one suggestion out of a booklet helped me to rid my hogs of worms. It was the McLean County System of Swine Sanitation all boiled down in one, two, three order.
4. "Then there was a formula for treating metal surfaces, so paint would stick, particularly galvanized iron. This pointer cost only a penny.
5. "I was surprised to know there was anything new on horse feeding. But here, for a penny postcard, I learn how to feed less hay, keep my horses in good working condition and actually save on feed bills.
6. "And I learned that cows, just like humans, eat more when things taste good. So, now we pay considerable attention to taste and variety in the cow barn and our milk check shows it.
7. "One book I received from a smart manufacturer taught me how to save fodder. We recut and grind it now, there's no waste and you should see the steers go for it.
8. "One of my postcards went to a seed-corn man and I learned how I had been fooling myself by striving for big ears. Now I grow corn that ripens early and produces medium size ears—lots of them.
9. "A cement company sent me plans for a septic tank that was so easy to build my wife wanted to know why we didn't do it ten years ago.
10. "And even so simple a thing as firing the stove or furnace. I learned from a coal company's booklet how to put in the coal to get more heat and less smoke."

If you could look behind the scenes, you would be amazed at the time and talent that go into the making of interesting, informative booklet offered by advertisers. Many represent years of study and research. These booklets and printed matter render real service. Write for them and mention this paper.

The New OAKLAND EIGHT

PRODUCT OF GENERAL MOTORS

Illustrated above: The 4-Door Sedan - Body by Fisher

An Eight of Superior Performance and Remarkable Economy

The year 1930 will see many farmers driving their first eight-cylinder automobiles. And those who select the New Oakland Eight will find themselves enjoying a number of special

advantages. Among these are Oakland's superior performance and remarkable economy. For the engine of the New Oakland Eight is even smoother and more flexible than you might expect an eight to be. In addition, it develops full horsepower for each 37 pounds of car weight. That is the reason for its tremendous pulling power, its snap and getaway, its impressive speed on hill or straightaway. And this fine 85-horsepower engine, with its full down draft carburetion and manifold system, consumes no more gasoline per mile than many sixes of equal weight. Other sources of economy are its many features leading to long life. One is a short, rigid crankshaft which has no vibration period within the speed range of the engine. Another is a new two-plane cylinder head producing uniform impulses of uniform intensity. Main bearings are large and easily lubricated. Water jackets of unusual capacity surround the valves and pistons, affording, in combination with the new water recirculation system, exceptional cooling efficiency. And still other features which lengthen Oakland's engine life are a full pressure lubrication system, rifle-drilled connecting rods which supply oil under pressure to wrist pin bushings, and the crankcase ventilation system which keeps water out of the engine oil. See the New Oakland Eight now on display in the showroom of your Oakland-Pontiac dealer. Notice the smart beauty of their bodies by Fisher—the variety of their new Duco colorings. Then arrange for a demonstration. This we believe will make you an enthusiastic admirer of General Motors' lowest-priced eight.

A LIFETIME OF REAL SERVICE

REMINGTON makes a wide range of patterns designed especially for farm use. It pays to buy good cutlery—the only kind that Remington makes. Here are knives and scissors that are sharp. More than that, they'll stay sharp a surprisingly long while. And when the time comes for resharpening they'll take a keen edge.

Remington scissors and shears are forged from solid pieces of high-carbon steel. They are hollow-ground, and are perfectly fitted so that they cut smoothly and evenly from the joints to the points.

The blades in Remington pocket knives and butcher knives are of the finest steel obtainable, hardened and tempered to insure uniform-

ity. Household slicers and paring knives are of Klein-blade (stainless) steel, with handles of walnut, or of Bakelite—a handsome material that looks as well in the dining room as in the kitchen. These knives have received the seal of approval from the Good Housekeeping Institute—a guarantee of tested quality.

Remington Cutlery is sold where good cutlery is sold. If you don't find it at your dealer's, send his name with the price of the items you select and they'll be forwarded promptly. Remington Cutlery Works, Bridgeport, Conn.

Distant Pastures

By S. W. FLETCHER

NOW that spring actually has come, and the glories of a Pennsylvania summer are just around the corner, perhaps we may be permitted a calm and collected view of the recent super-heated land promotion activities in southern Texas. The borough of State College has fallen for them, and fallen hard. No less than a dozen of our reputable citizens, with bulging money bags (no college professors among them) journeyed to the New Eldorado, mostly on transportation provided by the promoters. Several returned with less gold but more real estate. If all of Pennsylvania was worked by these high pressure salesmen as thoroughly and effectively as this little borough, they reaped a golden harvest.

It is noticeable, however, that these expeditions to the Rio Grande are organized only in midwinter, when any land having a reasonable degree of warmth and sunshine looks fair as the garden of Hesperides to the hardy survivors of a Pennsylvania winter. But there is another side to the picture. How many Pennsylvanians would invest in Texas land, with a view to founding a home, if their introduction to it was in July instead of February? A comparison of the Lone Star and the Keystone states would be far more favorable to us in July than to Texas in February. Hot? Yes, hot; very hot, in fact. Flat? Yes, flat; very flat, in fact. A man who has lived among the green hills of Pennsylvania might pine away in southern Texas. He would miss them mightily, anyhow.

Pennsylvania Has Climate Too

This brings me to my first observation—that Pennsylvania is not disposed to take a back seat to Texas, or Florida, or California, or any other state, on climate the year around. Of course, it would be nice to drop down to Texas for a month or so, in midwinter, for a change; but that is quite different from living there all the year. I hope, moreover, that nobody will try to run a Texas farm from Pennsylvania. I know people who have attempted to operate an apple orchard in the North, in the summer, and an orange grove in Florida, in the winter. The scheme does not work. There are enough uncertainties in agriculture at best without adding the hazard of absentee ownership. Long range farming seldom pays.

I am reading again, with keen appreciation, the literature of "The Magic Valley." "Literature" is the right word, for the prospectus certainly exhibits vivid flights of the imagination. My appreciation is more for the salesmanship craft than for the proposition itself. This prospectus, running true to form, is written in the red ink of superlatives.

How Figures Talk

In the bright lexicon of "The Magic Valley" there is no such word as conservatism—not yet. If one grapefruit grove nets \$1,000 an acre this year, it necessarily follows that all other grapefruit groves, even those yet to be planted with the 6,000,000 young trees still in the local nurseries, will net \$1,000 an acre annually. If a seven-year-old avocado tree produces

THE YOUNG PEOPLE

Why I Am Leaving the Farm

Dad Collects the Profit First Prize

I AM going to leave the farm because I have always had bad luck in anything I have tried to raise or do. I have worked for other people, earned quite a lot of money, and my father collected the money.

When I tried to raise crops I would never be able to sell or keep it because Father always said I would get my pay in food and clothes.

I had a dog one time and it was just large enough to be a great play-fellow. One day when I was away from home a man came to our place and gave my father five dollars for the dog. When I got home and went to the barn to feed him, the dog was not there. I ran back to the house and asked my mother what became of my dog and she said Father had sold him. When I heard this I can't tell you how I felt to think my playfellow was gone.

It was not only my pets my father sold, but everything I raised—pigs, chickens, ducks, sheep and some calves—they were all sold and it was the same old story.

Now, if that isn't enough to turn any boy from a farm I don't know what is. Disappointed Boy.
Pennsylvania.

NO TIME TO PLAY Second Prize

I'M going to leave my father's farm because I have to work in the barn; because I have to spade and hoe, and doing that I cut my toe.

I have to pull and hoe the weeds. And then help out with the kitchen needs. After that it's this and that—

So you see the reason I'm leaving Dad. "Now water the horses and milk the cows." That all comes with the daily wows. "Chase out the ducks, chickens and geese." "Look after the sheep and watch their fleece."

"Now mow the lawn and gather the eggs." That's too much strain for my young legs. "The chicks will need some water too." And that was all I had to do.

Then for once I start to run and play—Gosh, there are the pigs coming my way. So I feed the pigs and turkeys too. Now isn't that all for me to do?

"No, take old Nell and make some hay." "And just forget about the play." "And spray the spuds and hoe them too. Now isn't that all for me today?"

So why am I going to leave the farm? With work to do and all that yam. With not a pleasure nor a play. Now can you expect me with Dad to stay? Pennsylvania. Frank Vogenlek.

Congress Needs Some Pep Third Prize

I AM going to leave the farm because I think boys have a better chance to get an education in the city. I want to save my money for a college course. I think I should like to study law and become a lawyer. I like to read stories about the men of history who became great lawyers and afterwards generals or president.

The farmer has a very important job because he raises our food. But Dad knows how to handle our farm.

I hope to get a seat in Congress some day so I can help argue the Farm Relief bills for they sure do need some one who has a little pep. Then if Dad is still living it will help him back home.

That's why I want to leave the farm—I think I can help my father after I have become a congressman. West Virginia. Charles E. Hovatter.

What Manners Mean to Me

First Prize

WHAT do manners mean to me? They mean as much to me as to any self-respecting girl. They mean popularity, respect and a definite feeling of self-satisfaction in doing one's best.

Manners mean much. But they are not a gift, they have to be cultivated. If a person is determined to cultivate her manners, she will do it, but if she only thinks she will do it, it will not be done. Things are done by doing not by thinking.

The person who is well brought up may go anywhere and not feel any embarrassment. Breeding and manners show in every action.

Everywhere a girl may go, her characteristics are brought out by the way she acts. If she is at home, the hospitality she shows to a visitor often leaves an impression which may be imparted to others and increase her popularity.

In the dining room her behavior at the table and the conversation she carries on will, if it is mannerly, gain for her the esteem of the people present.

If, while she is in a street car, she gives up her seat to an elderly person, she has won her respect and the respect of the people in the car by her thoughtfulness.

When she has done her best, she is better satisfied and does not have to look back with pangs of shame, wishing people would forget. But though people forget, or think badly of an unmannerly person, they do not forget a polite, thoughtful, or courteous person and as a reward, her reputation grows as she goes along and may bring her one day her most valued opportunities.

Using such a person as an example I have tried to show what manners mean to me. From this it may be seen that manners form one of the rungs on my ladder to success.
New Jersey. Lily Brodsky.

GOOD MANNERS CONTEST

Second prize.—Bernice Fleming, Pennsylvania.
Third prize.—Mary Simpson, Pennsylvania.
Fourth prize.—Pearl Conaway, Pennsylvania.
Fifth prize.—Arlene Quay, Pennsylvania.

Do You Know Your A B C's?

THE blank spaces can be filled in with letters of the alphabet and the meaning will be clear. There is

still a very fine fountain pen waiting for the boy or girl who sends in the correct answers, accompanied by the best letter with suggestions for improving the Young People's page.

This isn't as hard as it looks and just to encourage you timid ones, we have given the letters in the first two lines. Who needs a good fountain pen? Two letters are needed in each blank space.

The farmer leads no E Z life.
The C D sows will rot;
And when at rests from strife
His bones all lot.

In has to struggle hard
To living out;
If frosts do not retard
His crops, there'll drouth.

The hired has to pay
Are awful too;
They rest when he's away.
Nor work will do.

Both cannot make to meet
And then for takes
Some boarders, who so eat
& no money makes.

Of little finds this life;
Sick in old lies;
The debts he leaves his wife.
And then in dies.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

Upper left.—An especially posed and personally approved portrait study of Sir Ronald Lindsay, newly appointed British Ambassador to the United States, photographed in his full dress formal uniform in which he paid his first call and presented his credentials to President Hoover at the White House.

Upper right.—First photo of the model of the proposed National Archives Building which is to be erected at Washington to provide a secure storage place for valuable historic documents, many of which are now stored in makeshift quarters.

The model is now on exhibition at the Treas-

ury in Washington.

Center.—Philadelphia, Pa.—This photo shows Kathryn Rabe of Haddon Heights (N. J.) High School, runner-up, and James Christie of Chester (Pa.) High School, winner of first prize, at the fourth annual Pierce Interscholastic Spelling Championships held here. Miss Rabe missed out on the word "filigree" which was correctly spelled by Christie.

Lower left.—Winsome little Miss Lois June Allen, five-year-old daughter of a former A. E. F. veteran and now a guest at the Veterans of Foreign Wars National Home at Eaton Rapids, Mich., opens the 1930 sale of Buddy Poppies by

pinning one to the lapel of President Herbert Hoover at the White House in Washington.

Bottom, center.—Burbank, Calif.—America's first all-metal low-wing cabin monoplane, designed by James K. Northrop (who created the "flying wing"), and which is being tested here. The 425 h. p. Wasp motor is expected to drive the new ship at a top speed of 180 m. p. h. and a cruising speed of 150 m. p. h.

Right.—Boston, Mass.—Photo shows a mighty monster of the Atlantic—an odd shot of the liner "Leviathan" as she reposed in her berth at the South Boston drydock where she is being repainted and generally overhauled for the coming tourist season.

PAINTS and PANTS

Buying a can of paint is like buying a pair of pants. One you put on the house and the other on yourself but in both you're looking for the same results. You want coverage. You want good looks. You want durability—you want the pants to stay on you and the paint on the house for a long time.

For best results buy good pants from a good clothing store and Felton-Sibley paints from your Felton-Sibley dealer.

Farm & Dairy

By L. W. LIGHTY

CONTROVERSY is an excellent sharpener of wits, but often at the end we know less with assurance than at the beginning of the argument. Fifty odd years ago I was considered an expert debater and our lyceum met weekly where we shredded all the questions extant. Rather often I convinced the judges that my argument was the best. What was worse, I convinced them it was true when I did not believe it myself but had to hang to my party. These experiences convinced me of the futility of controversial argument to find truth. Any one who has followed the argumentation in our U. S. Senate must be convinced of this.

I feel that my friendly critic R. I. Weigley knows all this, but he loves argumentation so much he is ready to take the hopeless side of the question. Doubtless he would have been a stiff opponent had he met with us in the old Academy more than half a century ago.

As I write this I look out the window to see my neighbor spreading his straw pile with the manure spreader, which he has rigged for the purpose, and it is an easy job which he often does. The sharp coulters on the tractor plows cut the straw, and the plows are so adjusted that between each pair of furrow slices is a light layer of straw which on disking will be completely incorporated with the soil and render it much more retentive of moisture, while the edge of the furrow slice sits on the subsoil and there is not the slightest interference with the subsoil moisture.

That Antique Manure Pile

When some old champions that old rain-soaked, cow-tramped manure pile has a hard row to hoe. In this day that argument needs crutches.

Way back in 1889 a bulletin came to me from the Cornell Experiment Station where the chemists had kept track of several such manure piles which were left only six months to weather and "cure." The result was loss in weight 57 per cent, loss in nitrogen 60 per cent, loss in phosphoric acid 47 per cent, loss in potash 76 per cent. The valuation had decreased from \$2.80 in the start to \$1.06 per ton when hauled out on the land. A number of other observations reported in the same bulletin indicated a very great loss in every instance.

As a struggling farmer that set me to thinking forty years ago. Since then dozens of similar reports have come from many entirely reliable sources confirming the Cornell findings, so that today few farmers allow manure to accumulate unless they can care for it in a shelter and control the moisture supply and the fermentation.

The manure is taken out and spread on the fields where it belongs and there it is well cared for. That dark liquid that my friend points to coming from the field in the runoff water has been examined by the chemist folks and often there are only traces of fertilizer constituents in it, rarely enough to consider. The coloring matter is not plant food.

Relative to poking run at the college man our friend has got me all wrong. My only college experience was that of a visitor and I am accused of too much "fun poking," but I would rather laugh than groan. But no man appreciates and honors the real scientist and investigator more than do I. Where would we be in our soil work but for the great work of a line of chemists and investigators from Liebig, 1850, down to our own Storer, King, Johnson, Hilgard and many others? Would we still buy fertilizer by the odor? But look at the results of putting the findings of the scientific investigators into practice on the farms of this country. The only question now is to dispose of the things we produce on the land.

'Anything else, Sir!'
'No! what else could I want?'

WELL NOW what could he, my friend, want? Here he is in the Hamilton Hotel. His room is furnished right up-to-the-minute. He has a bath and a private bath, white as snow. He has service a-la-carte. He is in an atmosphere of friendly individualism. He has a spacious, beautiful lobby at his disposal. He knows that he is getting \$5.00 worth of comfort and luxury for only \$3.00 a day.

Low in Protein...
Mrs. L. M. Boyd.

YOUR cow apparently gets no succulent feed such as silage, beets, mangels, etc. You could remedy this item by purchasing some dried beet pulp. Soak three to five pounds of it for twelve hours in a gallon or two of water. Then mix the grain feed with the soaked beet pulp just prior to feeding.

Your grain mixture is too low in protein. Corn and oat chop contains only about 10.5 per cent of crude protein. Your cow is evidently getting timothy or mixed hay and with such roughage as this a grain mixture containing from 20 to 23 per cent protein would be more efficient for milk production purposes.

I would suggest that you mix 200 pounds of chop with 100 pounds of cottonseed meal or gluten meal and 100 pounds of linseed oilmeal or soybean oil meal or peanut meal. Feed the cow one pound of this grain mixture for approximately three and one-half pounds of milk if she is a Jersey or a Guernsey. Feed her one pound of grain for approximately four pounds of milk if she is a Holstein or Ayrshire or Brown Swiss.

The cow would give a more liberal supply of milk if you had clover hay or alfalfa hay instead of timothy or mixed grass hay. Nothing can probably be done about the hay proposition at this time of the year, but if you can provide clover or alfalfa hay for next year's feeding you will have much better roughage.

Which Is More Profitable...
A. A. Borland.

am starting on a large farm and would like some advice in regard to which is the more profitable, selling milk to a condenser, or raising calves and selling them. Veal sells here readily. Would cows milk as long with the calves as by hand milking? Cows to be fed for milk in either case.

Frank Brooks.

Low in Protein

I have a cow that freshened five weeks and two days too soon. She got along well, gave two gallons of milk daily for about six weeks, then she failed in her milk and is getting poor in flesh. Has all the hay she will eat. I also feed her chop. Would like to know the cause and what to do.

Mrs. L. M. Boyd.

YOUR cow apparently gets no succulent feed such as silage, beets, mangels, etc. You could remedy this item by purchasing some dried beet pulp. Soak three to five pounds of it for twelve hours in a gallon or two of water. Then mix the grain feed with the soaked beet pulp just prior to feeding.

Frank Brooks.

SINCE you do not state the price of milk at the condenser, or the price of veal calves, I could not tell you which would be the more profitable.

Under ordinary circumstances I would judge that selling milk to a condenser would be the better proposition, but without any note of prices you can readily see that this would simply be a guess.

It is doubtful if cows will milk as long with calves as by hand milking. The calves are not likely to milk the cows so thoroughly as by hand milking and this will have a tendency to dry up the cows.

A. A. Borland.

Cow-Testing Ass'n Report

Lehigh County

THE Lehigh County Cow-Testing Association finished its sixth year March 1, 1930, with seventeen whole-year and two part-year members.

The result for the six year's testing is as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1925 | 260.51 | 8159 | 274.5 |
| 1926 | 236.24 | 8056 | 271.8 |
| 1927 | 236.25 | 8623 | 292.1 |
| 1928 | 189.62 | 5798 | 302.8 |
| 1929 | 259.47 | 8110 | 279.3 |
| 1930 | 229.73 | 8190 | 297.7 |

Six herds with an average of five or more cows exceeded an average production of 300 lbs. of butterfat. A complete list of these herds follows:

| Owners | Breed | Milk | Fat |
|--------------------------|-------|--------|-------|
| Gen. Harry Trexler | R.H. | 7,404 | 383.3 |
| Harold Ziegler | R.H. | 10,583 | 351.4 |
| Allentown State Hospital | R.H. | 10,616 | 338.7 |
| Edna Able | R.H. | 9,701 | 321.3 |
| Saucor Farms | R.H. | 9,215 | 310.9 |
| Wm. H. Rupp | R.H. | 8,897 | 300.2 |

Why Magnetic Force is used in the New De Laval Magnetic Milker

IN the new De Laval Magnetic Milker the important function of creating and controlling pulsations is performed by magnetic force. There is no other method so perfectly qualified to meet the requirements of milker pulsation control, for magnetic force possesses everything desired—unfailing dependability, sensitiveness, instantaneous response and simplicity of application.

Perfect, uniform, fast and regular milking is largely dependent upon pulsations. They must be regular and absolutely uniform. Irregular pulsations have the same effect on the cow as a change of hand milkers. Through the use of magnetic force, timed positively by a gear-driven cam in the pulso-pump, pulsations in the De Laval Magnetic Milker are uniform and regular to a split second. No matter how many units are in operation at one time, every pulsator moves as one. Every cow is milked the same at each milking with resulting beneficial effects.

For perfect milking, the saving of valuable time and labor, and the substitution of pleasure and satisfaction for drudgery, the De Laval Magnetic

Milker is distinctly in a class by itself, offering new high standards of milking. Outfits for milking one to 1000 or more cows. Operated either by gas engine or electric motor.

The De Laval Utility Milker For the Low Price Field

The De Laval Utility Milker, designed for the lower price field, is a quality milker ideal for small herd owners with whom price is a limiting factor. De Laval Utility units operate on any single pipe line, a fact of importance to dairymen who want the advantages of De Laval milking, but who feel that they must retain a part of their original investment.

Planting Worries Disappear

when this machine goes to work on your farm

MCCORMICK-DEERING Potato Planter are made in 1 and 2-row sizes. With a tractor the 2-row is best. Both sizes can be operated with either tractor or horses.

The MCCORMICK-DEERING Potato Planter

HERE is a potato planter that will help you to make the most of conditions this Spring. It saves a lot on costly labor, gets work done quickly, and the seed is planted just as carefully as if done by hand.

With the McCormick-Deering, your biggest job is to keep the

3-bushel hopper supplied with seed, and to steer the team or tractor. The seed chamber is open so you can see and be sure that the seed is being properly planted. Get prices, equipment information, and full details from the McCormick-Deering dealer in your town.

Put the Burden of Harvesting on the McCormick-Deering Potato Digger

It digs the potatoes, shakes dirt off, and puts them in easy-to-gather rows. Does away with a lot of hired help. The correctly designed shovel gets all the potatoes. Durable made to stand up under hard work. Write for a folder.

Box 424, Landisville, Lancaster Co., Pa.

Farm Facts and Fancies

By ALVA AGEE

IT isn't the thing to do any hedging when critics of our experiment stations and extension forces point out that the activities of scientists are directly responsible for the surplus of farm products that depresses prices. We do not meet the criticism squarely when we say that the aim is to produce what is needed on a smaller area. If that is the aim, certainly the man behind the gun is a poor shot.

If I could grow four hundred bushels of potatoes per acre on five acres, next year I should plant ten acres to double up on net profit. It is a fact that our experiment stations, our extension work and our farm papers have contributed heavily to the present output of American farms. If it were not so, we should be chagrined: being so, the truth should be granted.

Doubling Capacity

I have been saying a-plenty about the national policy of developing public land into farms when not needed, and hope to say more as the policy continues, but all the addition to our supply from this source can be only a small fraction of the present increase in production over what it would have been if the use of fertilizers had not been developed. The improvement of seed, the immense gains from breeding, the control of disease and insects—the list of forces at work to increase our food supply is too nearly endless to try to mention.

The last I name, and the biggest of all, is the results of inventive genius that lifted us out of the day of the grain sickle. All of these forces are of one sort, leading to continuous expansion of production up to the point that no matter how population increases we hold prices down close to cost of production, throwing in a lot of labor and capital without any accounting. It is so.

As to the Criticisms

Nobody rises today to complain that inventors got us away from the use of the hand-sickle in harvesting wheat. Why not? If we had to depend on it there would be no surplus at several dollars a bushel. We should not have any surplus of milk if our dairy breeds had not been developed to present capacity. Equally we should be wearing homespun clothing if science had not been availed of by others. If our level of living has been raised greatly by increase in productive power among other classes of workers, agriculture must be likewise affected by progress. There is no basis for argument in this matter, and there is no one to blame, if we except governments and policies in Oriental countries that do not give their people earning power.

Then what is the matter with farming? Simply this: All human wants, except in respect to food, have no limit, and those supplying them can make money in doing so. When a man is full of food, all the enterprise and advertising and selling schemes cannot increase his consumption very much. He is full, and that is all there is of that.

What Would You Have?

Would you choose to be in an occupation that had no share in the world's progress, and that could attract and hold only those who are mentally dormant? You would not. A man must have room to use all his skill or he will feel crowded if he has any size worth mentioning. The only course open to the individual is to use all that science can offer him, depending on his ability to hold his own.

He can take the world as it is in this respect, or leave it, but he cannot isolate agriculture as something that will not take its share out of scientific progress just as all other industries do. His best friends are those who know the most of what he needs to know to hold his own. Seems a hard world? Yes, seemingly it may be, but if it were otherwise we should be way back of where the Indians stood when we stepped in and took their land from them. Doubtless they thought it was a hard world.

Incidentally it may be worth mentioning that it would have been easier for the Indians when we were taking their land, and easier for us today, if we had taken less.

Farm Papers

Accepting the fact that farming is an occupation appealing to intelligent people, sometimes I quite idly try to rate the relative values of the educational forces that have helped to make it what it is. A large group of studious and energetic farmers helped to make our farm papers influential. They contributed experience and observation and they created the public sentiment that made experiment stations and agricultural colleges possible, or at least put them in the way of financial support by public funds. The farm press has continued to be the surest support of these institutions.

At the same time it has brought forward the facts that men on farms gain through experience, and quite possibly the advertising columns of the agricultural press have contributed as much to stirring us to do things as have all the men who have talked on platforms. Colleges, stations and the farm press pull in the same direction, and the last one named exerts the widest influence because it is the nearest to millions of good farmers in their homes and on their farms.

Fertilizing Corn

A subscriber has a ten-acre field that he is going to plant to corn by hand. A heavy sod was plowed down last November. He proposes to broadcast 20 per cent phosphate and put a little nitrate of soda in the hill. I suggest that he apply 150 pounds of the superphosphate broadcast, and put 100 pounds in the hill. I should mix enough nitrate of soda with the phosphate going in the hill to make the percentage of nitrogen one-third that of phosphoric acid in the mixture. It is entirely possible that a heavier application would bring more net profit, but land that grows a heavy sod for plowing down is pretty good land anyway.

Flock of Cheviot ewes on Lewis F. Nicholas' farm in Northampton county, Pa. Individuals of this flock have been winners at Reading, Allentown, Trenton and Maryland State Fairs.

Eastern Farmers and the Farm Board

FARMERS of the eastern seaboard states are hearing the answer of the Federal Farm Board to their query: "When do we share in federal farm relief?" and that answer may be condensed into one word, "Wait!"

Dr. Frank B. Bomberger, until recently chief of the Maryland State Department of Markets and now in charge of cooperative marketing organization work for the Federal Farm Board, told an audience of wheat growers in Delaware recently that the Board could do nothing for the eastern farmers until its more pressing problems in the West and South had been solved.

In reply to a pointed question as to what the grain growers of Delaware and Maryland might do to market their wheat through the marketing machinery set up by the Board, he said, "Wait." He amplified this, of course, by explaining that the National Grain Corporation does business only with regional groups. There are no regional grain marketing organizations in the East at this time, though it is hoped that one or more may be organized during 1930.

Preliminary Studies

The Board, apparently, is coming around to the idea that it will be impossible to organize cooperative marketing of farm products in the East along the single commodity lines followed in the West and the South, because of eastern diversification in production. Charles S. Wilson, member of the Board, explained this recently:

"Some of us who have made preliminary studies of the problem (in the East) believe the situation may be met by encouraging the development of local cooperative associations equipped with facilities for assembling, grading, packing, storing and loading various kinds of farm products grown in this region," he said.

"In the development of cooperative associations within the area, it may be necessary for growers in a single community to provide buildings and equipment to handle many farm commodities rather than to build a separate local cooperative for each of their marketable products."

"These community locals, receiving many different agricultural products, could then be linked up with national cooperative sales agencies for individual commodities, wherever these agencies are established for the marketing of any of the products handled by the community locals."

A Job Ahead

This suggests something of the job ahead of the Board here in the East and explains why nothing, probably, can be done to aid farmers in disposing of last year's wheat crop. But this does not help the farmer who is facing a loss on his stored wheat.

At the recent annual meeting of the Eastern States Farmers Exchange, in Springfield, Mass., Quentin Reynolds, general manager of that cooperative, voiced a growing feeling among Eastern farmers.

"Farm relief so far as Congress is concerned," he said, "has grown to mean getting more for southern and western farmers out of eastern markets. Politically, the East seems to be regarded as a market for the products of western and southern farmers. The stabilizing groups already organized are buying wheat and cotton so as to get the surplus out of the way to force the domestic consumers—regardless of the fact that many of them are farmers—to pay more. The farmers who are producing grain and cotton are being urged to diversify, although it is obvious that almost all of the crops substituted will compete in eastern markets already well supplied, and that we must meet this new competition or allow still more of our land to revert to deer pastures."

R. B. T.

Raise the Calf, but Sell the Mother's Milk

RAISE YOUR BEST CALVES: that is the right way to build up your herd. But using whole milk makes a calf too expensive, so it is necessary to use a calf meal which takes the place of whole milk.

When a calf is a few days old it can be shifted gradually from its milk diet without loss of growth or health, provided you substitute calf meal gruel made from Amco Calf Meal, with skim milk. By making this shift you can sell the whole milk of the cow and save from \$20 to \$30 within six months.

Amco Calf Meal replaces a calf's natural food by other ingredients which produce the same rapid,

healthy growth, and do it more economically. This Calf Meal contains the best growth promoting materials, in the correct balance to insure profitable and rapid development.

Amco Calf Meal is palatable and highly digestible; the materials are freshly mixed when you get them, so there is no danger of digestive upsets or days off-feed. The calves like it, and it is easy to feed. Feeding directions are furnished with every bag. Your nearest Amco Agent will supply you.

This field will produce BIGGER POTATOES

Niagara Dusts and Dusters Give Certain Protection And Insure A Bumper, Profit-paying Crop

Potato dusting is no longer an experiment! Its success on many of the country's leading potato farms (those, for example, in Armstrong County) is the final proof—here is the *certain* method of crop protection. It is a simple way to safeguard crops, too, and can be accomplished quickly, with a saving of hours of valuable time. And in addition to eliminating the necessity of water, dusting permits the use of much lighter equipment.

Eminent potato growers have abundant praise for the three factors in effective pest control: Niagara Copotex (the insecticide that kills without injuring plants), Niagara Copodust (the disease preventer that's gentle to the foliage), and Niagara Dri-Fog Dusters. . . . Niagara Dusters are built after improved designs, are light weight and give thorough, economical distribution of dust. Specially arranged nozzles insure complete coverage of foliage.

Are you interested in bigger crops of better potatoes? Write for complete information.

By R. P. KESTER

A YOUNG man who aspires to become a writer asks me for some pointers. He says he does not want to be just an ordinary hack writer, but desires to become one such as people will want to read after regularly. In other words he wants to be able to put "punch and personality" into what he writes.

Well, I am like the old colored man who was asked if he could change a ten-dollar bill, but could not. I thank him for the compliment, but I cannot give him any sure-fire rules for becoming a successful writer, for two reasons; first, I do not know any such rules and, second, I could not get them over to him if I did.

I do know this, however, and it applies to speaking as well as to writing. To get a hearing, one must have something to say, and be able to say it in a style that people can readily understand. But if the world is convinced that a man has something to say that is worth hearing or reading, it will excuse a good bit in the matter of manner and style. In the same way, the real worth of a man or a woman is not dependent on the kind of clothes they wear. But the clothes do affect us while first impressions are being made.

I have known a good many popular speakers and writers who were popular because they were able to dress poverty-stricken ideas in such splendid words and gesture that they won considerable applause, at least for the time being. Bluster, noise, verbosity, eccentricity of style will get some attention, but the fame of the Shakespeares, Miltons, Byrons, Shelleys and Lincolns does not rest on such superficial things as studied acting or trick phrases.

However, style is something that cannot be overlooked by one who aspires to public favor. But as with courtesy and graciousness, style in writing is partly an innate quality of character, and partly the result of education and environment.

I have listened to a good many addresses, orations and sermons that consumed time and produced volume of noise, but which left nothing helpful to think about afterward. Plenty of speakers and writers have a good vocabulary, and are able to string words together to an interminable length. In other words, such people are like the colored preacher who was told by one of his deacons: "You-all talks a lot but you don't say nothin'."

The best way for a beginner to begin is by writing down, as if for publication, his thoughts on something he feels strongly about. Then read it over to see where it can be improved and shortened. Shorten the sentences, and see to it that ideas follow each other in a related order. Be generous in the use of periods, and economical in using conjunctions. Above all, don't overwork the poor adjective. It seems, judging by much of the social conversation, as if the English language were short on all words except adjectives.

One of the most common mistakes writing novices make is in stringing their sentences out too long. I received a letter the other day from a lady who wrote two full pages without a period. It was one of the longest sentences I ever saw and, while the handwriting was good, I had to read the letter through three times before I was sure of just what she wanted to say.

During the twenty years I have been engaged in newspaper work, I have been fully convinced that our educational institutions—colleges as well as grade schools—are failing to teach punctuation. Ninety-nine per-

cent of the manuscripts that come into an editorial office require some punctuation, however well written they may be otherwise. And since I have seen many which were written by teachers and professors, I probably can guess why the layman does not know how to punctuate a manuscript or letter.

But all this is probably far from the few short, simple rules for becoming a good writer which my correspondent hoped to get. All I can say that is worth while may be summed up as follows:

Begin to write. Be a merciless critic of your own writing. Once an article is written, tear it apart; do it over, pare it down, cut out superfluous words, and, finally, if it does not suit you, burn it and try again.

Friendly Talks

By
Edgar L.
Vincent

A YEAR with plenty of rain and sunshine, a year of good honest hard work, and you have the satisfaction of looking into the finest crib of corn or the best bin of wheat it was ever your good fortune to grow. And then what? An exhibit at the county fair, a blue ribbon and the acclaim of your neighbors as being the best farmer in the community.

And then what? You may settle down content with what you have achieved, leaving well enough alone. That is what many a man has done. That is why we have so many commonplace farmers; that is why farming runs along in such a dead level in a great many parts of the country. We forget that we never have reached the best; we lose sight of the fact that we never can reach the best. We are too much governed by the sentiment that what we have done is "good enough." But, oh the joy, the supreme satisfaction of reaching up, ever reaching up toward the things that are best!

A mother eagle bears her young bird on her back far into the blue. When high up toward the sunlight she suddenly slips away, leaving the young eagle to test its own wings. The chances are that the first time and many a time afterward, with a scared cry the young bird comes fluttering down after its mother, but the old eagle is patient. Again and again she bears the fledgling aloft and a day comes when they are away up in heaven's deepest blue, something new grips the heart of the young bird, and with a wild cry it flaps its wings and sets out for a flight such as neither mother nor fledgling ever dreamed of before.

And it may be so with you and me. Fired with a new hope, inspired by a new courage, year after year we may reach something better than anything we have attained yet, and so achieve success not hitherto deemed possible, and so do our part toward lifting the world to the best.

On the Westward Trail

Listen my children the while we tell of a jaunt to the western coast, of mountains bold and grizzlies old and the placer miner's boast. For beyond the sears by which man mars the valley & the plain there still holds sway in proud array an untamed wild domain. Against the sky the snow caps lie, nor heed the beating sun, while grandeur gleams from woods and streams that will not be outdone. And the sunset trail of the pony mail is the ghost of boisterous days when gold and gain and pride and pain led on the gambler's ways.

HAVING delivered ourselves of the above ballyhoo let us proceed to the corn cure, whale oil and spavin liniment—good for man, beast, bird and bulldog—guaranteed to cure all ills of the flesh and rejuvenate the spirit, perk up the appetite and paint roses on pale cheeks. It will take cricks from oldish backs, lubricate stiff joints and smooth the wrinkles out of furrowed brows.

Last winter we relieved 130 farm folks from the monotony of milking cows and feeding chickens night and morning for ten days, and this summer we offer a similar sample of our farm relief remedy, which is a vacation trip to the Pacific Coast, Western Canada and way stations by way of the well-known Rocky Mountains and much territory on both sides of them.

After harvest and before the rush of fall work farmers need a vacation. We have arranged for one which we believe they will remember. It is an all-expense, personally-conducted, de-luxe journey from coast to coast—and back again—taking in famous mountain scenery and resorts, the wheat and corn belts of the Central West, national parks, gigantic lumber enterprises, the apple industry of Washington and the sunset on the Pacific—a cross-section of the United States designed to instruct,

entertain and recuperate those who go along.

In making up the itinerary of this trip we find that we are able to include a host of some of the most interesting places on this or any other continent. They include Niagara Falls as a starter. We shall not attempt to describe the Falls, but we hear that they are well spoken of. Next will be a stop in Chicago, metropolis of the Mid West, where the antics of grain gamblers and gunmen are trivial compared with the achievements of industry which change a chunk of steel into a shining tractor hitting on all cylinders and ready to turn over a township of sod or perform any of the feats credited to a giant of fairy tales; where a magnitude of commerce is ushered in by the aroma of the stockyards, the acres of cattle pens, the world-renowned packing houses which turn the product of pasture and feed lot into steaks, chops, cutlets and everything else from bologna to harness leather, or from glue to banjo strings. Then there is Boul Mich. You will enjoy Chicago.

From Chicago to the Pacific

Between Lake Michigan and the foothills of the Rockies a thousand miles of prairie and wilderness has been turned into a bread and milk factory such as no other region in any period of the world's history ever knew. There are the dairy farms of Wisconsin and Minnesota, the wheat fields of the Dakotas and the meat ranches of Montana. There are also a thousand lakes and miles of forests, "bad lands" and presumably "good" cities, a region replete with history and teeming with hope. It is worth seeing, and now is your chance.

On the westward trip the party will cross the great plains by way of St. Paul, Minneapolis and return through the grain belt of Kansas and Missouri, across the corn fields of Illinois, Indiana and Ohio, with stop-offs at strategic points to get acquainted with the most interesting parts of the country.

We shall see the sights of western cities, outstanding farms, ranches, bears in Yellowstone National Park and the apex of Pike's Peak. We shall see glaciers, gorges, geysers and the never-ending wonder of the Rockies. We shall inspect a huge lumber camp in Oregon, the famous apple country of Washington, take a boat ride on Vancouver Bay and photograph surviving members of the Indian race in war garb assembled.

We have neither wind, space nor inclination to tell more about the trip at this time, but shall give facts and figures in future issues. Very soon we shall print dates, names and places, a complete schedule which will tell just how and where the party will go. This event is scheduled to take place during the first half of August, and if you are thinking of going it would be well to arrange your plans accordingly.

There are several advantages in taking such a trip in a group. There is the advantage of congenial associates, for a Pennsylvania Farmer vacation tour is a big picnic from start to finish, with the work, worry, ants and spilled coffee left out. There is the advantage of a carefully selected route on which the most things of the greatest interest can be seen in the shortest time, for there is no waiting for trains, no fussing about baggage, no delay at connections, no an-

Blackfoot chief in formal costume. The Blackfeet are famous for the splendor of their dress. Some of them will be seen on the Pennsylvania Farmer vacation tour.

noyance about tips or lack of service. Everything is first-class.

By going in a group we get entertainment and sightseeing trips that could not be had by an individual or small party except at prohibitive cost, if at all. When you buy a carload of feed you expect to get it cheaper than if the same amount was bought in small quantities, and when you buy a vacation in carload quantity you can get the same discount. The total cost of this trip, including everything, is only about two-thirds of the cost to an individual making the journey alone, and the individual could not possibly get all the things which this trip furnishes, even if he spent more money and time at it.

No Work or Worry

The consequences of "all work and no play" are generally admitted to be disagreeable if not disastrous, and the remedy for this state of affairs is as pleasant as it is logical. The value of a vacation, of a change of scenes and activities, is recognized in all industries, and it applies to agriculture as well as to others. By going with a congenial party on a personally-conducted journey not only is the cost reduced to a minimum but the annoyances of travel, such as catching trains, buying tickets, giving tips, making hotel reservations, finding a good place to eat and arranging our schedule so that we shall be at the right place at the right time are all taken care of by the tour conductor. All the tourists need do is go along and have a good time in good company and "see America first." If you would like to take this trip, the first western tour to be conducted by Pennsylvania Farmer, kindly let us know.

Majestic cities built by man where the beaver cut his wood, while ranches rage on scrub and save where the bison chewed his cud. The buckskin shirt of the pioneer now hangs to gather dust, the packtrain crawls past beeting walls and the six-gun lies in rust. The redman rides on his raids no more, the call of the throbbing drum or the warwhoop dies beneath painted skies, which to the traveler beckons "Come."

A scene in Glacier National Park, which is one of the natural wonders to be visited on our vacation trip this summer.

A PUZZLE

THE conferees of the House and the Senate have agreed to a tariff on hides and their products. The duty on cattle hides is ten per cent; on leather made of such hides 12.5 per cent, on side, upper, calf and kip leather 15 per cent, on boots and shoes 20 per cent, on harness, saddles, etc., 35 per cent, and so on. Can anybody figure out great benefits for farmers under such a schedule?

ANOTHER GENTLE ONE

UNDER date of April 12 we have a brief note from Mr. L. J. Stemple, Amboy, W. Va., which says: "Today one of our progressive farmers, Mr. L. Teets, was in the barn with a two-year-old bull, 1,100-pound Guernsey. The bull gored his hand and head, only missing an eye by a fraction of an inch. Mr. Teets is hurt internally; chances are 50-50 to die or get well. . . . Gentle as a lamb but treacherous as the devil!"

A REALIZATION LOAN

ANOTHER loan is to be made to finance the disastrous coffee stabilization enterprise of Brazil. This is called a realization loan, granted on condition that the enormous stocks of coffee be gradually but completely turned into cash during a stated future period. Evidently it is the wisest of all the coffee loans made thus far, for the accumulation is too great to be sold at once or within a brief period.

READY MONEY

THE United States government has \$37,750,000 which belongs to persons who can get their money any time by presenting their securities. These persons are the holders of government bonds or notes which have been called for redemption but never turned in. Most of these obligations were issued after April 1, 1917, but a few are much older. For instance, bonds maturing before 1861 are still outstanding to the amount of \$151,000.

A GLIMPSE

IN reporting the Chicago cattle market for Monday of last week the Drovers Journal says: "Total receipts at Chicago thus far this year are the smallest in more than forty years. The population of the country has

PENNSYLVANIA FARMER

April 26, 1930

more than doubled in that time, yet demand for beef is very limited." This is not a complete picture, merely a glimpse at a part of the picture. But it is significant of changes which are the result of many influences at work during the past forty years.

BEFORE WE LAUGH

ONE of the planks in the political platform of a Texas candidate for the United States Senate is a government cow for every poor man. Absurd, of course, but before we crack any ribs laughing at it we might pause and ask how it compares in principle with government fertilizers, government irrigation, sundry government subsidies and government price manipulation.

FROM LIFE

A CERTAIN man was better known in his community as a tinker, hunter and trapper than as a worker. He never worked regularly or long at anything. The automobile came along and he wanted one. He found that he could buy it on the installment plan but he must work regularly if he made his payments, so he got a job and stuck to it. He never missed a payment. Incidentally he learned that regular work was not so hard, in fact it was easier and better in every respect than his old way. So he kept on working and buying things on the installment plan. He bought the home which for years he had rented, made regular payments on it and owns it now. He bought a piano for his daughter and paid for that, and then several other things including a radio. All this took years to do, but he was happier in doing it than he had ever been before, and he became a real citizen of the community instead of a mere hanger-on. The installment plan has its uses as well as its abuses.

IN THE DARK

WHEN the subsidiary of the Federal Farm Board began to trade in the open market we naturally expected that its transactions would be made public, for it is a public agency financed by public funds and operating under the direction of an official board. But no reports have been published and none even promised. All concerned are in the dark as to the nature and the extent of its market operations, which uncertainty is not only detrimental to the market but unfair to all concerned therein. From the start we have advocated the publication of all information as promptly as is consistent with accuracy, and now others who see the harm done by secrecy are advocating it too. One of them says: "The government, being the people and for the benefit of the people, is not justified in acting in secret to the detriment of any of the people. Their transactions should be made public from day to day."

AN EXCHANGE'S PROTEST

LAST week the Memphis Cotton Exchange adopted resolutions reciting charges against the Federal Farm Board and its agencies and demanding an investigation by Congress. The Exchange charges the Board's agencies with dominating the futures market, "deranging values of the various options and utterly destroying the usefulness of these markets for hedging purposes, thus striking at the financial structure of the South by eliminating the only protection the banks have in financing cotton." It charges further that the alleged manipulation "has resulted in almost complete cessation of demand for actual cotton from mills and merchants for prompt as well as future delivery," has undermined the confidence of mills and foreign buyers in the stability of our market-

ing system, has seriously interfered with distribution and has "reduced the basic value of all spot cotton."

Whatever Congress may do with these and similar charges now, it is evident that the so-called stabilization activities of the Federal Farm Board will result in derangements that will compel attention sometime. And then the reader whose memory is good will remember that we have always asserted that markets could not be stabilized by adding uncertainties to them. That is what the stabilization plan does and must do, no matter how benevolent its purpose or how conscientious its administration—and there is no question about either.

"UPSTANDING CITIZENS"

THERE are two things in the annual report of the Farm Loan Board which deserve some publicity. One of them is that the reorganization of the farm loan system "will tend to assure the strength and the stability of the system in the future." The report says: "Taking all factors into consideration it would seem that faith in the country, faith in the fundamental soundness of the farm loan system and faith in the farmers of the nation would justify confidence in the future growth and progress of the system."

The other thing is an expression which signifies much when we remember that it comes from a body which carries more loans on farm property than any other single agency. After reviewing the difficulties that have confronted and still confront agriculture the Board says: "On the other hand constant and sweeping declarations of pessimism and despair during the past several years have tended to convey the impression that all farmers are insolvent, which is far from the truth. Such unqualified statements create the wrong psychology and are bound to be harmful to the credit of farmers. The great body of farmers of this country are up-standing citizens who meet their obligations as is demonstrated by the experience of the banks of this system."

TRAMP COWS

IN 1929 Wisconsin cow-testing associations reported 40,623 cows with an average production of 7,570 pounds of milk and 192 pounds of fat worth \$173 at a feed cost of \$118. The members of these associations are progressive farmers in a territory famous for good cows, but of their 40,623 cows 2,236 ate more than they produced. Commenting on these records, Mr. H. C. Larson, secretary of the Wisconsin Butter Makers' Association, shows that if a like percentage of "tramp cows" exists throughout the country they would produce 190,000,000 pounds of butter a year at an actual loss to their owners while creating a surplus detrimental to all dairymen. The tramp cow swindles not only her keeper but every other dairyman.

NOMINATE THEM

AS the names of the new Master Farmers are announced each winter it is easy to think of other individuals who should have been considered for the Award. But when the next annual call for nominations is made there is a tendency to leave it to the other fellow to send in the names. Consequently some very worthy farmers never have been nominated. We trust you will use the nomination blank on Page 8 of this issue to name any one you think belongs in the ranks of the Master Farmers. The judges will not overlook what it indicates about his community standing if the man you nominate is also named by several others.

New Jersey Farm Comment

By G. W. HARRIS

Independent truckers claim that they came to the rescue of the public when the railroads fell down on service a few years ago and that they are entitled to support in a fight against encroachment upon their field of operation.

A hearing before the Public Service Commission concerning the application for franchise for this network of truck lines will be held on May 20.

This action has at least brought the independent truckers together and may pave the way for organization for the benefit of all interests.

WHEN I visited Barton Brothers' farm in Camden county last Tuesday I found them bunching truckloads of fine rhubarb ready to send to the Philadelphia market. They had started to pull their 11-acre field of rhubarb that week and accounted for its earliness and size as a result of their method of hilling the rows and fertilization.

Farmer Brown gets his cows safely across the road.

Last fall when they last worked the field the north sides of the rows were hilled higher than the south side. This gave each row a southern slope so that more heat from the sun would be retained early in the spring when it was most needed to force growth of the plants. It was just the old idea which is commonly used in the erection of sash frames practically applied out in the field.

Fertilization played an important part in the early growth. This spring before the plants appeared above the ground 200 pounds per acre of nitrate was applied to the field and two weeks later 200 pounds more were applied. Each acre of rhubarb received in all 400 pounds of nitrate, 200 pounds of potash and 400 pounds of phosphate.

TWO Hunterdon county calf club members made the state honor roll last month with their club animals. The four-year-old Holstein owned by Kenneth Smith of Flemington produced 1,378 pounds of milk and 48.2 pounds of fat during March to make the honor roll for the sixth consecutive month.

Eleanor Tottem of Ringoes was the other club member to get her name on the roll. Her five-year-old Holstein produced 1,469 pounds of milk and 41.1 pounds of fat.

DR. W. J. SPILLMAN, senior economist of the United States Department of Agriculture, blames the stock market crash of last fall for the low prices of dairy products. The unemployment which came about last fall reduced the consumer demand for dairy products and resulted in a considerable surplus, especially of butter and this operation immediately forced prices down to ruinous levels, he told members of the Hunterdon County Holstein Association when they met at Flemington last Thursday evening.

FRUIT and vegetable growers in New Jersey, members of the New Jersey State Horticultural Society, will again meet in Atlantic City this coming December, according to the announcement of A. J. Farley, secretary of the association.

For several years past, members of the Society have held their annual meetings at Atlantic City, but last year the meeting place was changed to Asbury Park. The exact dates of the meeting have not yet been set, but it will be during the week the New Jersey State Grange holds its annual convention.

THE New Jersey College of Agriculture is gradually establishing a museum of early farm machines. The latest gift received by the college is an old Smalley cultivator which was commonly used in Central Jersey years ago. It is the gift of Ira Stern of Middlebush.

John Smalley of Bound Brook patented the cultivator which bears his name in March, 1859. It is one of the first of the two-horse riding cultivators, and its mechanism enabled the driver to raise and lower the cultivator teeth without dismounting. The inventor was the grandfather of George O. Smalley of Bound Brook, a graduate of Rutgers in the class of 1906, and now a member of the State Board of Regents.

A Wage Problem Solved

THE Gloucester County, New Jersey, Board of Agriculture, has found a most satisfactory method of solving the vexing problem of reaching a uniform wage scale for the harvesting of many vegetable crops that are grown in this section. Instead of letting each farmer reach an arbitrary price per package for harvesting, the local county board has had a committee of farmers draw up rules and regulations governing the prices that are to be paid for that season. No hard and fast rates are established, but a tentative range of prices is set up to guide the two thousand growers who employ harvest hands during the season.

This committee recommends a range of rates on asparagus cutting and bunching, another rate for picking tomatoes for table stock and for the canning factories; another rate for peas, beans, white potatoes and strawberries. If a group wants rates established on other crops the committee also takes them into consideration and informs the growers of their opinion.

By adopting such a procedure, they have enabled the growers to get their crops harvested cheaper, as it prevents pickers from working one grower against another in forcing the price upward. It has overcome a practice of forcing an entire community to pay a very high price because some grower with a light crop has had to pay a high price to get the light crop gathered. It frequently happened that the grower with the light crop really establishes the wages for the section.

To meet this situation the executive committee of the county board of agriculture has taken up the entire labor and crop situation and have laid down a fair wage scale for the harvesting of crops, which take into consideration all sizes of yields that are grown. They also take into consideration the possible labor supply that may be available at harvest time.

On harvesting asparagus, they set up a range of 45 to 50 cents per dozen bunches, for cutting and bunching the crop. Where the grower does his own bunching, they contend that 30 to 35 cents per crate is a fair wage to pay.

Tomatoes are handled in the same way. The committee decides that four to six cents per $\frac{1}{2}$ basket is a fair price for this kind of work regardless of whether the tomatoes are for the canning factory or for table stock.

A price of 15 to 25 cents for picking peas is also established with a provision that 20 cents should be an average price for most fields.

On beans, a rate of 15 to 20 cents per $\frac{1}{2}$ basket is advised, while three cents is considered about right for picking up white potatoes. Strawberries are to be picked for 72 to 80 cents per crate.

In announcing these rates the labor committee makes no effort to establish a tight and inflexible rate, but offers them as suggestions for the growers to follow.

This year, they have also recommended a wage of \$40 to \$50 per month with board for month hands and \$70 to \$75 without board. For day hands they have recommended \$3 to \$3.25 without board and \$2.60 to \$2.75 with board. A. K.

Do You Know a Master Farmer?

THIS is the fourth annual call for Master Farmer nominations. Now that our readers know more about the aims and scope of the Master Farmer movement, and we have had more experience in conducting the work, we hope this year's project may be even more successful than heretofore. There will be some minor changes in the rules and methods of procedure. But the fundamentals remain the same.

We trust that this year's selections will bring honor to farmers who are deserving of honor for what they are and for what they have accomplished. But further, we hope the Master Farmers of 1930, like their predecessors, will bring inspiration to all other farmers and will stimulate the growing respect of the public at large for the profession of agriculture.

The success of the Master Farmer work depends largely on the response to this call for nominations. No one can know a man's true fitness for this honor as well as his friends and neighbors. For that reason we depend entirely on the public for nominations. No farmer is considered for the Master Farmer Award until some one sends in his name. So, if you know a farmer whose career is an inspiration to you, give us his name. The Nomination Blank below is for your convenience.

For the benefit of new readers we may explain that the Master Farmer project is sponsored by Pennsylvania Farmer as part of a nation-wide movement whose object is "to dignify agriculture by recognizing and dramatizing its successes; to encourage farmers to take pride in their calling; to inspire farm boys and girls by showing them that outstanding success is possible in agriculture as in other occupations—not only success that is measured in money, but what is more important, the success that comes from an upright and useful life in family and community."

Master Farmers may be specialists, or their operations may be widely diversified. They may hire a hundred hands, or they may do all their own work. They may own their farms or they may be tenants. The only essentials are that they be successful and progressive as farmers, and that they measure up to the high standard of rural citizenship set forth in the Master Farmer Score Card.

The Essential Facts

The Master Farmer Award consists of a beautiful gold medal which is presented to the men elected for the honor at some important agricultural meeting in their state or section. In the past the medals for Pennsylvania, Delaware and Maryland have been presented at a large banquet given by Pennsylvania Farmer in honor of the Master Farmers and their wives in the Ballroom of the Penn-Harris Hotel at Harrisburg during the annual State Farm Products Show. Last year the New Jersey awards were made during the State Farm Show at Trenton and the West Virginia Awards during Farm Week at Morgantown. The new Master Farmers of 1930 will be honored in a similar way.

To nominate a farmer for one of the Master

Farmer Awards it is necessary only to send his name to the Master Farmer Editor, using a letter or one of the Nomination Blanks.

Any one not a full time member of the Pennsylvania Farmer Staff may make nominations. Any farmer living in the following states may be nominated: Pennsylvania, New Jersey, West Virginia, Maryland, Delaware.

Candidates of former years must be nominated again to be considered this year.

No predetermined number of Master Farmers will be chosen from each state, but it is anticipated that about the same number of awards will be given as in previous years.

The names of Master Farmer candidates and of the people who nominate them are not made public in any way.

Likewise, no confidential information received about candidates or from them is revealed to any one without permission.

Nominations should be sent as soon as possible to the Master Farmer Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Penn'a.

How the Master Farmers Are Chosen

All farmers whose names are sent in as Master Farmer candidates will receive an exhaustive questionnaire. It covers every phase of their work, and is to be filled out and returned to the Master Farmer Editor.

The questionnaires will be analyzed and compared carefully and candidates who clearly cannot qualify will be eliminated. All those remaining, including any about whom there is any doubt, will be visited by one or more members of the Pennsylvania Farmer editorial staff who will collect additional information for the Boards of Judges. After they have assembled all the essential facts and visited as many of the leading candidates as possible the judges will choose the men to be honored as the Master Farmers of 1930.

The personnel of the Boards of Judges to make the final selection of Master Farmers in the various states will be announced later.

The men who have been chosen Master Farmers under the supervision of Pennsylvania Farmer follow:

Pennsylvania

1927.—Robert F. Brinton, Chester county; J. Clayton Brubaker, Lancaster county; James E. Eastman, Bradford county; Fred E. Hess, Luzerne county; John Schroepe, Schuylkill county; H. H. Snively, Lancaster county; Eugene Stapler, Bucks county; Frederick Taylor, Lawrence county; J. R. Ziesenheim, Erie county.

1928.—Ray F. Brown, Huntingdon county; E. S. Ferry, Bedford county; Edison M. Hay, Somerset county; Amandus Larson, Elk county; S. S. Lehman, Erie county; William G. Mendenhall, Chester county; Harrison S. Nolt, Lancaster county; Clarence H. Smith, Bucks county; C. B. Snyder, Lancaster county; F. P. Willits and Son, Delaware county.

1929.—George M. Anthony, Berks county; C. R. Baermeister, Somerset county; Henry F. Garber, Lancaster county; Guy L. Hayman, Chester county; Harvey C. Kreitz, Crawford county; Guy A. Leander, York county; Andrew T. and John C. McDowell, Mercer county; Charles F. Preston, Lancaster county; Norman E. Rishel, York county; Samuel L. Smedley, Jr., Delaware county.

New Jersey

1927.—Jacob L. Pittenger (Deceased), Monmouth county; Charles B. Probasco, Mercer county.

1928.—William J. Clayton, Monmouth county; Willard B. Kille, Gloucester county; Clifford E. Snyder, Hunterdon county; Wallace W. Titsworth, Sussex county.

MASTER FARMER SCORE CARD

All of the subjects listed below are considered in judging candidates for the Master Farmer Awards. Full allowance for differences of soil, climate and type of farming are made by the judges.

I. Operation of Farm—

1. Maintenance of soil fertility
2. Crop rotation
3. Seed used
4. Quality, feeding and care of livestock
5. Quality, variety and care of fruit trees and truck crops
6. Efficient use of man and horse labor
7. Adequate tools, machinery and equipment well housed and repaired
8. Convenience of farm arrangement
9. Products of farm, yield and quality

II. Business Methods and Ability—

1. Relation of income to expenses
2. Accounting methods
3. Business reputation
4. Marketing methods

III. General Farm Appearance and Upkeep

1. Repair and upkeep of buildings
2. Appearance of yards
3. Condition of fields
4. Condition of fences and ditches

IV. Home Life—

1. Convenient house
2. Labor-saving equipment in home
3. Character as father and husband
4. Education and training of children

V. Citizenship—

1. Neighborliness
2. Interest in schools and churches
3. Interest in other community enterprises
4. Interest in local and national government

1929.—James C. Ewart, Middlesex county, Charles Fitting, Atlantic county; Franklin G. Rue, Monmouth county; Alfred F. Sloan, Salem county.

Delaware and Maryland

1927.—Frank C. Bancroft, Kent county, Del. 1928.—L. Otis Corkran, Dorchester county, Md.; O. A. Newton and Son, Sussex county, Del.

1929.—Ray C. Norman, Harford county, Md.; John D. Reynolds, New Castle county, Del.

West Virginia

E. S. Humphrey, Wood county; Charles C. Lewis, Mason county; John D. McReynolds, Harrison county.

Master Farmer Awards were given in West Virginia for the first time in 1929. In New Jersey the Master Farmer work has been supervised jointly by the American Agriculturist and the Pennsylvania Farmer after the first year.

Value of a Good Sod

CORN is an American product that the farmer who is growing livestock cannot well do without, and it is a costly mistake to the fertility of the land to plow land for corn if you have not a heavy sod or cover crop to plow down to furnish organic matter which becomes food for the following crops. It would be better for the producing power of the land to defer the corn crop for a year, grow a crop of soy beans, harvest the beans for hay, disk the ground and seed to vetch, rye and crimson clover, to plow down the following spring.

Another practice on many farms that helps to reduce the producing power of the land is that of leaving the corn land of the past year, without a cover crop to protect the land from washing during the winter, with the thought of growing corn or oats the following year.

As an example of such practice, on route number 19 in West Virginia there is a farm of about one hundred acres of which fifty per cent is tillable land, an exception to the majority of West Virginia farms. In the spring of 1929 the owner plowed for corn a piece of rolling land that had a southwestern exposure; the sod on the land was meager, but the broom sedge was fairly rank, to which he applied the match before plowing; the land was planted to corn and potatoes, the harvest was meager.

No cover crop was seeded, the rains of the past winter have made gutters three to four inches deep all over the field, and yesterday I saw the plow at work preparing land for future planting.

I do not think the agricultural agent could find in the county a better place to demonstrate what can be done toward improving the producing power of land that is receiving such treatment, and the worst is that if something is not done the ravages will go on indefinitely.

Harrison county, W. Va. John W. McReynolds.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Stocum, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the vain hope that something will happen to create business for the sawmill they have built. The son and daughter advise following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill.

taking time to fish and cook. It was a risky venture. Of this she was well aware, but what else could they do? There was, in fact, no alternative. They had no means for traveling otherwise; nor could they pass another winter there at their mill without extreme hardship. "Something told me we must go," Milly afterwards said; "that we must trust to fortune to find our way through to Prince Rupert."

"We will pack our cooking kit and other belongings on old Peregrination's back," she told her father and Winthrop, "and lead our Jersey behind him, so as to have milk and cream on the way. I know there must be open, grassy places where they could feed, if we did not hurry them."

In short, Milly tried to think everything out in advance, to be prepared for contingencies. All her life she had been a pioneer girl and knew many of the shifts and expedients to which settlers and campers in new localities have to make resort in adverse circumstances. The most depressing feature of their preparations was their father's frame of mind. The poor man had quite lost courage for this or any other undertaking, and stood about repining, indulging in the most gloomy predictions as to what dreadful fate would befall them on the way. Not a little strength of mind and purpose on

The Cheerful Plowman

BEAUTY COLUMN

NOW, once again I rise to preach, I rise to exhort and to teach the gospel truth of paint. I rise to urge both friend and foe to keep the surface covered so the heart can know no taint.

I see a barn, its humping back is rent with fissure, seams and cracks, its doors are warped and bent; its roof is sagged, and troughed and gray, its window sills are in decay, its joists not worth a cent. Now I recall when that old shack that now has canyons in its back stood forth in all its pride, stood forth a royal type of thing, fit for the ponies of the king and princes' cows beside. Say, I recall when that facade was whole, and sound, and newly made and painted red as socks; it was a pleasure to the eye of every sinner passing by; it was a handsome box.

I thought the thing would stand sublime until the end of measured time, a home for fatted beast, I thought that it would last as long as Stephen Foster's sweetest song, nine hundred moons, at least. What's wrong? I'd like to ask you that. Why has it opened for the bat, why is it now a wreck, why are its eave-boards sagging so, the sport of swallow, wren and crow, what force has bruised its neck?

Why, water, chiefly! Can't you see how moisture, droplets small and wee, one at a time at first, have crept into the pine and fir without a fuss, without a stir, and carried germs immersed? Yes, water did it, that is right. It caused the growth of parasite, bacteria and such, it boosted culture of the germ that made the lumber so infirm. Germs spread to beat the Dutch.

A coat of paint, all water-proof, spread over wall, and sill and roof, with oils and other stuff, would easily have held at bay those carriers of quick decay, and called a halt and bluff.

When surfaces are covered thick with paint that shows no seam or nick wood cannot rot, that's plain, for save the surface and it's true you save all things beneath it too; you must keep out the rain. J. E. T.

Milly's part was needed to bear up constantly under the weight of his low spirits. It was her daily task to infuse a little of her own courage into his foreboding mind—a well-nigh hopeless task.

There were many things to do and much to prepare, but at length all was ready—all that their limited means permitted—not, however, until as late as the third week in June, the eighteenth, I believe. On that morning they bade adieu to what had been their home on Woodbridge Creek for four years. The mill they left as it stood. It had been found quite impossible to sell either that or the lumber. It was the last of the ill-advised enterprises of Freeman Woodbridge's life—his last mill. Some presentiment may have warned the poor fellow that this was the last of his earthly migrations. That may have been the cause of his depression.

Had they known what was before them, it is doubtful whether even Milly would have had the courage to start.

But start they did on what, under the circumstances, was one of the most remarkable journeys ever undertaken. One can imagine that quaint little cavalcade setting off tearfully, by the foot-trail along the north bank of the Peace: Winthrop going ahead, gun over shoulder, Milly leading well-laden Old Peregrinations by his halter, with Jersey Brighteyes following on behind, and Freeman Woodbridge bringing up the rear with a stick to keep her from straying aside.

Blind Barty they left behind, asleep in his den on the other side of the creek. It would have been kinder, perhaps, to have put an end to his helpless life; yet neither Winthrop nor Milly could bear the thought of shooting him. Blindness appeared to have quite robbed Barty of his natural ursine ferocity. Though an inveterate beggar for food, he had become a singularly gentle creature. Once for a moment he had made a transient effort to attack Brighteyes, but a sharp touch of her horn had convinced him of the futility of trying to be a bear again. What his fate would be, left there alone, they did not like to reflect on; but to fetch him with them appeared wholly impossible.

During all her preparations it had been a secret happy thought on Milly's part to surprise the Mastermans—call on them at their new home at Prince Rupert, quite unannounced.

Almost at the last moment, however, she determined to send a letter, saying that they were on their way over land, through the mountains, to join them. This letter was left at Hudson's Hope, several days after they started, to go by mail via Edmonton and Vancouver. By mischance the mislaid letter went to Montreal and London, before being returned to America. When at last, late in autumn, it reached Prince Rupert, the Mastermans had gone from there to Queen Charlotte's Islands, to embark in an ambitious enterprise of whaling in the North Pacific. In consequence Quinby Masterman did not learn of Milly's perilous undertaking until the following March. Made aware from the date of her much-traveled letter that the Woodbridges had left home to cross the great and then little explored wilderness, nearly ten months previously, he was filled with direst forebodings as to what had befallen them. Dropping all other business for the time, he organized a search expedition, with results that will be recorded hereafter.

MILLY'S plans had been carefully laid; and truth to say they were good ones, so far as any possible foresight on her part could reach. Old Peregrinations was to carry their outfit, Brighteyes was to follow after, with the elder Woodbridge guarding the rear; while Winthrop, going ahead with his gun, acted as escort to protect the little party from bears, wolves or other enemies, and also to shoot such game as might be sighted by the way.

They were to travel but five hours each day, in order to have plenty of time for camping, fishing and cooking, also to give the horse and heifer time to graze. Milly thought they might cover two miles an hour and advance ten miles daily. At that rate she reckoned that the journey might be made in a hundred days. Allowing twenty days for wet weather and other delays, she had good hopes of reaching Prince Rupert by mid-October.

A truly brave plan and one we describe as wholly Milly's, for, though her father and Winthrop had a great deal to say, it was Milly's counsels that they almost invariably followed. It was Milly, too, who led the horse and watched over the precious load he bore.

(To be continued.)

The Farm Home

Precautions Against Moths

THERE are two very important precautions to be observed if you wish to protect your woolen and fur garments from moth damage over the summer months. First: Before it is put away the clothing must be thoroughly brushed, beaten, cleaned, and, if possible, sunned. Having it dry-cleaned immediately before storage is a help, but the articles must not be left exposed to moths that may be flying about the house, after they come home from the dry cleaner. They must be put away at once. If the garments do not need dry cleaning they should be gone over vigorously with a whisk broom or stiff clothes brush to dislodge any chance larvae or moth eggs already on them.

Second: The container in which they are stored should be made absolutely tight so no moths can get in later to lay their eggs on the clothing. If it is a trunk or chest, the edges must come together snugly, with no spaces; if a cardboard box, it should be covered with several thicknesses of strong unbroken wrapping paper. The ends should be carefully turned in and tied, or, better still, all laps and crevices should be sealed with gummed paper. If a closet is used, even a cedar-lined closet, the edges of the door must fit tight together or be sealed with gummed paper strips.

It is an additional precaution to put naphthalene flakes or paradichlorobenzene crystals in the containers with the clothing, but the main point is to make the container tight. The same care in preparing clothing for storage must always be used. A tight container, however, is of no value unless the clothing is entirely free of moths or unless naphthalene or paradichlorobenzene is used.

Settle the Moth Trouble

The girls in the illustration, which was taken by the Bureau of Entomology, U. S. Department of Agriculture, are combing the fur and brushing winter coats preparatory to storing them over the summer. Woolen and fur-trimmed garments, blankets and other articles that remain in use as warm weather comes on should be cleaned, beaten and sunned once or twice a month to prevent moth attack. As a rule, moths do not trouble articles in constant use.

There are various ways of fumigating rooms or closets that have become infested. They are described in a farmers' bulletin on clothes moths. Cold storage is another method of caring for valuable fur and fur-trimmed garments, recommended in this bulletin.

Ask for Bulletin No. 1353 to settle the moth troubles. The same request might as well bring you help in fighting other household pests.

Farmers' Bulletin No. 740, Control of House Ants; Farmers' Bulletin No. 1408, How to Suppress the House Fly; Farmers' Bulletin No. 734, Flytraps and their Operation. All are free from U. S. Department of Agriculture, Washington, D. C., or from your Senator.

Something to Do

THE first cry of the waking child-mind is: "What can I do?" No life is ever long enough nor complete enough to fully satisfy this demand of the normal human mind for something to do and more and more we want something to do that counts.

With that insistent inner urge driving them on, men have dared the worst that earth can offer as well as the best. No mountain is too high; no mine is too deep; no climate too hot nor too cold to check this eager spirit. Most of us can understand, something of the satisfying joy that obedience to this inner call brings. But instead of welcoming the creative quality of the groping instinct so often heard in the childish phrase: "I'll do it myself," we too often condemn it and turn a natural and help-

Brush and clean garments well before storing them

ful instinct into a mere, stubborn resistance to opposition.

Some good day we shall learn to use these groping instincts for life's best and cooperate with nature in the growth of body, mind and spirit just as we do in seed and plant and tree. From small beginnings the active mind reaches out to ever larger undertakings and finds growth and health of body and mind in the process.

Happy the boy and girl who owns a few tools, a work bench and a work shop. Work with the hands enlarges brain growth in youth and sustains health of brain in later life. A retired farmer added to his years as well as to his joy in life by alternating an hour in his garden with an hour of rest on his cot under the shade of a tree.

An elderly invalid kept a light camp stool while she worked among her flowers, marking the choicest specimens when at their best, thus keeping a dependable supply of seeds and bulbs for her customers. A shut-in keeps an age-weight-height record for a number of children whose busy mothers find it hard to keep health habits linked with the monthly record of the scales.

After all, there is work enough waiting to be done by alert minds and willing hands everywhere. Hepsy Neff.

Pink cheeks from a good diet, plenty of sleep, sunshine and exercise in the open, do not rub off.

A comfortable height for the kitchen table is generally about eight inches below the worker's elbow.

Rugs should be neutral in color and conservative in design to create an artistic background for a room. A gaudy conspicuous rug may draw so much attention to itself that none is left for the other furnishings.

Madison, West Virginia, celebrated Child Health Day last year by staging a children's festival. Here you see the king and queen in whose honor happy groups of youngsters are playing games. The court house steps provided an excellent throne.

Child Health Day in Your Community

MAY DAY—National Child Health Day, 1930, strikes a deep and vibrant note. Each successive May Day has challenged us to think and act upon one particular thing vital to the health and well-being of childhood, from the correction of their remediable defects to the provision for every child of the right kind of recreation, in the right amount and the right place.

This year May Day addresses itself to the fathers and mothers of the United States. Upon them depends the success of all efforts to ensure a sound mind in a sound body to every child. Therefore, the National Child Health Day Committee of the State and Provincial Health Authorities of North America chose as the special keynote of 1930 "Parent Cooperation in Community Child Health and Protection."

Divisions of Child Hygiene can help enormously to make possible intelligent parent cooperation. They can prepare material that explains what the state child-health program is and how it will protect the child in his home. Schools, both directly through their contacts with the parents and indirectly through Parent-Teacher Association study groups, can still further help parents to the understanding for which they are asking.

Libraries can make a valuable contribution by getting together simple material which has been recommended by local physicians and to which fathers and mothers can refer. Magazines and newspapers can and do help, by every line which they carry on the well-being of children.

These are some of the things of which May Day, National Child Health Day, 1930, would remind us. May Day asks of us all—parents and health workers—intelligent cooperation in the nation's child health program. The President can call a White House Conference on Child Health and Protection; others can say, "Let us consecrate May Day to the children of the United States." But only parents by their cooperation can make the results of the conference helpful and practical in the life of the child, and can translate the ideal of May Day into child health, child happiness, child success. Let each one of us write to U. S. Department of Labor, Children's Bureau, Washington, D. C., and ask for bulletins on Child Health.

Watermelon Cake a Prize Winner

THIS is our favorite "birthday cake" and besides being so good it is pretty, and the "talk of the table."

Three-fourths cup butter, three eggs, three cups (sifted cake) flour, one teaspoon vanilla, raisins, two cups sugar, one cup milk, three teaspoons baking powder, one teaspoon vegetable cake color (red).

Cream sugar and butter, add well-beaten egg yolks and beat again. Add the milk and flour alternately, (baking powder sifted with flour) beating thoroughly after each addition. Add the red color and tuck in a few raisins for the melon seeds. Fold in the stiffly-beaten egg whites. Bake in moderate oven in three layer pans. When cold use this icing:

Blend one tablespoon butter, one cup confectioner's sugar, two tablespoons scalded milk, one-half teaspoon vanilla, and divide the mixture into three parts. Add a few drops of red coloring to one part and spread it between the layers. Cover the entire cake with a second part leaving it natural white color. Use green cake color with the third part and spread this over the outside, covering the whole cake. Then watch the kiddies smile!

Mrs. L. L. Swartz

Pennsylvania.

To prevent soft custard from curdling, keep the water in which it boils below the boiling point. If it curdles it may usually be made smooth by beating with egg beater.

No. 6824.—Ladies' dress. Cut in eight sizes: 36, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. A 36-inch size requires 5 1/2 yards of 36-inch material. For contrasting material, 1 1/2 yard 39 inches wide will be required. Trimming band of lace requires yard. Price 15c or two for 25c.

No. 5935.—Set of short clothes. Cut in three sizes: 6 months, 1 and 2 years. A 2-year size requires 1 1/2 yards of 36-inch material for the dress, 3/4 yard for the trousers, 1 1/2 yard for the rompers, 3/4 yard for the sack and 3/4 yard for the bonnet. Price 15c or two for 25c.

No. 6822.—Ladies' dress. Cut in five sizes: 36, 38, 40 and 42 inches bust measure. A 38-inch size requires 5 1/2 yards of one material 35 inches wide, for jacket and dress. The width of the dress at the lower edge with plaits extended is 2 1/2 yards. Price 15c or two for 25c.

No. 6474.—Girls' dress. Cut in four sizes: 6, 8, 10 and 12 years. A 10-year size requires 2 1/2 yards of 39-inch material. To finish with bias binding requires 2 yards 1 1/2 inches wide. Price 15c or two for 25c.

No. 6476.—Coat ensemble for girls. Cut 5935 and dress 6476 are both cut in three sizes: 8, 10, 12 and 14 years. To make the ensemble for a 12-year size as pictured will require 3 1/2 yards of material for the coat, and 6 1/2 yards for the dress and matching 36-inch material. Two separate patterns 15c for each pattern or 30c for two.

No. 6825.—Girls' set of undergarments. Cut in six sizes: 2, 4, 6, 8 and 10 years. To make the set in a 4-year size will require 2 yards of material 35 inches wide, finish with edging requires 6 yards 3/4 inch wide. Price 15c or two for 25c.

No. 6714.—Ladies' dress. Cut in five sizes: 36, 38, 40 and 42 inches bust measure. A 36-inch size requires 4 1/2 yards 36-inch material. For the tabs of ribbon 36-inch material. The width of the dress at the lower edge with fullness extended is 2 1/2 yards. Price 15c or two for 25c.

No. 6122.—Girls' dress. Cut in four sizes:

TWO HELPERS INSTEAD OF ONE IN EVERY BAR
That's why

FELS-NAPTHA LOOSENS GREASE SO QUICKLY

IT'S the combination of unusually good soap with plenty of naphtha that melts away grease—easily, quickly. No hard rubbing necessary!

Naphtha, you know, is a marvelous dissolver of grease. And there's plenty of "brisk" naphtha (smellie!) in Fels-Naptha. Plenty of it combined with good golden soap. Working together, they give extra help that loosens the greasiest dirt and washes it away.

Use Fels-Naptha in tub or washing machine. For soaking or boiling clothes. In hot, lukewarm or even cool water. It makes things easier for you and brings you fresh, clean, sweet-smelling washes. And this same extra help is

mighty handy for household cleaning.

Your hands will like Fels-Naptha, too. It works so quickly that it gets them out of water sooner, which is a big help in keeping them nice. Get a few bars at your grocer's today.

FREE—a Fels-Naptha Chipper. Many women who chip Fels-Naptha into washing machine, tub or basin find it handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha) just as you need them. Sent free and postpaid on request. Write today. Dept. 7-4-26. Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPHTHA ODOR

FELS-NAPHTHA

NEIGHBOR DAVE SAYS—

"Crooked Crick, out our way, got its name from bein' so windin' an' twisty. Pickin' th' easy way when it was little is what makes it so crooked now, I reckon. An' that's what makes some folks crooked, too—fellowin' th' easy way. It hardly ever pays in th' end. Even buyin' fence it don't pay—tho' I reckon it seems easier at th' time t' buy cheap ordinary rust-for-certain kind o' fence. Leadclad has got seven times as much coatin' as that kind, an' th' coatin' is everlastin' lead. I dare you t' drop me a card for th' catalog. Address—NEIGHBOR DAVE, at th' LEADCLAD WIRE CO., MOUNDSVILLE, W. VA. — Tonight!"

Potatoes Sprayed with Pyrox Yield 50 Bu. More per Acre

"MY 22 acres of potatoes sprayed with Pyrox averaged 50 bu. more per acre than where other sprays were used," writes Mr. J. D. McFaun, Manager of the Hillside Farm, Vintage, Pa., under date of Nov. 5, 1929. He says: "The quality of the potatoes is so good that I am getting \$2.00 per bu.—which means a 20c premium—at the Lancaster, Pa., market."

At \$2.00 per bu., Mr. McFaun's increased yield obtained by protecting his potatoes with Pyrox, amounted to \$100 an acre. Other growers report similar extra profits from crops sprayed with Pyrox.

Pyrox is a combined insecticide and fungicide, the growth of thirty years' experience. It is scientifically prepared to kill insect pests, control blights, and other diseases and to stimulate plant growth. It is quick and easy to use. It does not clog the

Mr. J. D. McFaun, Mgr. of Hillside Farm, Vintage, Pa.

nozzles and sprays in a fine mist. It has the best of sticking and covering properties.

Spraying with Pyrox is a profitable operation. Not only are the increased yields obtained which normally result from spraying, but an additional yield which will pay for any difference in the cost of Pyrox several times over. Pyrox is now priced lowest in 31 years. See your dealer today and get a copy of the new illustrated Pyrox Spray Guide.

Lancaster Co., Pa.

"Instant" Bordeaux Mixture . . .

RECENT experiments by leading Experimental Laboratories have shown the new and easy method of preparing Bordeaux Mixture known as "Instant Bordeaux" to be as fully effective as the well known standard formula provided the correct method is carefully followed.
The most economical and effective form of Copper Sulphate (Blue Vitrol) for making "Instant Bordeaux" is known as "Snow" Blue Vitrol. It comes in very small crystals, about the consistency of granulated sugar. To prepare—into the mixing tank, while water is running into it, place 4 lbs. lime. Then add 4 lbs. "Snow" Blue Vitrol agitating or stirring while adding and until all is dissolved. Then add water to make 50 gallons. Do not confuse "Snow" Blue Vitrol with the powdered "Snow" which is much more economical and dissolves readily. Safeguard the efficiency of your Bordeaux by using only

Nichols Triangle Brand Copper Sulphate
Genuine "Snow" Copper Sulphate

Triangle Brand also supplied in Large and Small Crystals and Powder

HORTICULTURE

By S. W. FLETCHER

To Start an Orchard

We have a lot of farm land that has been idle over a period of years and we now want to develop it as a fruit orchard and vineyard.
It slopes toward the west. If we send you a sample of the earth will you analyze it for us please and tell us what kind of fertilizer we need and just what to do to get started right?
Rosalie Shilka.

AN analysis of a sample of this soil would not indicate what fertilizers should be applied to it. The analysis would show the total amount of each of the essential plant foods that the soil contains, but would not reveal how much of this now is available for plant growth. The only reliable method of determining the fertilizer needs of a soil is to study the comparative growth of crops on different plots that have been fertilized with different kinds and amounts of plant food.

An orchard soil should be well drained, and not too heavy. It is desirable that the surface soil shall be open and preferably contain a considerable proportion of sand, chert or gravel. This makes it warm and easy to work. The subsoil may be clay, but should not be impervious. There should be no hardpan or tight rock within three feet, at least, of the surface and preferably deeper.

For orchard purposes, the physical condition of the soil is fully as important as the chemical composition. A good orchard soil should contain a large amount of organic matter—decayed vegetation; this increases its water-holding capacity and improves its physical condition. If your land has been idle for several years, and has accumulated a considerable growth of vegetation, it ought to be in good condition for orcharding.

The young trees will need very little fertilizer the first few years, provided the land is kept in a cultivated crop, as corn or potatoes. Half a pound of nitrate of soda per tree, or its equivalent in sulphate of ammonia, or other nitrogen carrier, may be applied the first season, soon after the growth starts, and again in July. Spread it in a ring about two feet away from the tree. This may be increased to one pound the second year.

If phosphorus is used, apply it mainly to the crops grown between the rows of trees, and especially in preparing the land for crops like red clover, sweet clover, or alfalfa that are to be turned under for soil improvement.
S. W. F.

Huckleberries

Could you send me a leaflet or information on how to grow bigger and better huckleberries? Gottlieb Kofink, Sullivan county, Pa.

If you refer to the named varieties of cultivated blueberry, write for the following publications: "Blueberry Culture," Bulletin 200, New Jersey Agricultural Experiment Station, New Brunswick, New Jersey. (Free on request.)

"Directions for Blueberry Culture," Bulletin 974, U. S. Department of Agriculture, Washington, D. C. (Thirty cents.)

"Commercial Culture of Whitesbog Blueberries," Joseph W. White, Inc., Whitesbog, New Jersey. (Free.)

The fruits of improved varieties of the cultivated blueberry are much larger than the average wild blueberry, and the plants are more productive.

Owing to the difficulty in propagating them, the plants are quite expensive, but the berries command a higher price than wild blueberries. There are now some hundreds of acres of cultivated blueberries grown commercially in the northeastern states; and there is a considerable industry in Florida. Some have made a fair start by transplanting superior wild plants to the garden.

The cultivated blueberry requires an acid soil, preferably peat or muck,

or muck overlaid with sand, and an abundance of moisture. It will not do well in the ordinary alkaline or neutral garden loam. Another important factor is the presence of a certain root fungus, which has a somewhat similar relation to the blueberry plant as the organisms that live in the nodules of clover and alfalfa.

If you refer to the wild blueberry (also called huckleberry) the "barrens" usually are burned off every three or four years, commonly in early spring. The object is to burn all the old parts of the plants, and surrounding undergrowth, so that the bushes will send up vigorous new shoots. These will bear the year following. Burning, however, is a dangerous practice, and it destroys the organic matter of the soil.

The time is approaching when blueberries will be grown, both commercially and in home gardens, as freely as blackberries are now. This will require alkaline-tolerant varieties; these will be developed by plant breeders. At present, plants of the improved varieties are so expensive, and the conditions essential to successful cultivation are so exacting that commercial blueberry culture must continue to be quite restricted. S. W. F.

Efficiency in Spraying

EVERY fruit grower should aim to spray his orchard thoroughly in the shortest possible time, and with a minimum amount of labor and material, according to A. J. Farley, N. J. extension specialist in fruit growing. This requires adequate equipment operated by men who know how to spray, and the development of a method of spraying that will insure thoroughness of application without the use of excessive amounts of material.

There is no special method of spraying which can be considered the best for all growers or for all orchards. Furthermore, spraying equipment that meets the requirements of one orchard may be inefficient in another orchard.

In some cases it may be desirable to increase the number of portable sprayers, or replace present sprayers with outfits having greater capacity. In other orchards, the installation of a stationary spray plant may solve what appears to be a very difficult problem. Still another possibility is greater use of equipment already on hand through longer hours of spraying during critical periods; improvement in refilling and spray mixing facilities; or some modification in the type of spray gun or nozzles now in use.

Every fruit grower should check up on his spraying operations from time to time from the standpoint of efficiency, bearing in mind that labor constitutes the greatest single item of cost in connection with effective spraying.

Wireworm Injury

EVERY year, especially during May and June, the thin, inch-long, hard-skinned, yellowish or reddish brown larvae called wireworms do much damage in Pennsylvania by boring into newly planted corn beet roots, cabbage roots, radishes and many other root crops. The Pennsylvania State College Laboratory at Kennett Square, Pa., is making a study of the biology and control of these pests. The farmers of Pennsylvania can be of great service in this study if they will send specimens of such injurious wireworms to the laboratory; or if they will notify the laboratory at the time when such injury is being done to their crops, so that the infested farms may be visited and the injury studied. Address all specimens, notices of injury, etc., to C. A. Thomas, Pennsylvania State College Laboratory, Kennett Square, Chester county, Pa.

Truck Crops

By GILBERT S. WATTS

Plant Lice

I am having trouble with green lice on my house plants and tomatoes. I was troubled with them last year. Michael Ewanick, Lackawanna county, Pa.

PLANT lice on tomato and other plants may be controlled by spraying with one-half pint 40 per cent nicotine sulphate and five pounds of hydrated lime to 50 gallons of water (one teaspoonful nicotine sulphate, one cupful hydrated lime and two quarts water).

In greenhouse and plant beds a very effective method is to fumigate by painting specially prepared nicotine solutions on the heating pipes or by burning nicotine papers that should smoulder rather than blaze. These materials may be secured from supply houses and will be found to give best results when used on still, humid nights. Follow closely the directions on the package.
G. S. W.

Fertilizer in the Hill

Is it possible to fertilize in the hill for tomatoes, cabbage, etc? Have been doing this for some years, using poultry manure. This year would like to use complete mixture, using superphosphate, potash and nitrate. Butler county, Pa.
C. J. Burns.

FERTILIZING cabbage and tomato plants in the hill at the time of setting was my regular practice several years ago when the fertility of my soil was lower. We used a half handful of fine ground bone or bone and tankage under each plant in addition to a broadcast application of a complete fertilizer harrowed in before planting.

However, a mixture of superphosphate, muriate of potash and nitrate of soda, or for that matter any complete fertilizer, may be used in the hill if precautions are taken to prevent excessive quantities being applied and to insure a reasonable degree of mixture with the soil. Otherwise serious "burning" may result.

In setting tomatoes four by four feet apart an ounce per plant would require about 200 pounds per acre. With cabbage half this quantity per plant would run into an acre application of several hundred pounds. As a rule very heavy applications should be broadcast and harrowed in before planting, particularly with crops that are closely spaced.
G. S. W.

Pruning and Hot Caps

What can you tell me about tipping early tomato plants above the fourth leaf? Do you think it is likely to delay the picking? I have two sash of Earlys which have grown a little more than I like, due to warm weather and much heat in sash. They are not heavy and are not ready to tip, but it is a long way to planting time, and I heard of this tipping and thought it might hold them back a little, but I am half afraid of it.
What about hot caps for tomatoes and peppers?
Montgomery county, Pa.
J. E. Trumbauer.

The practice of tipping or pruning back young tomato plants is not favored by many commercial growers or experimenters. As a rule little is gained and most growers prefer to lay leggy plants in the furrow with only the desired portion above ground. Roots will be formed all along the buried portion of the main stem. In fact I once saw a small grower set in this way some tomato plants that were fully three feet tall. Of course the handling of these was a delicate and tedious job, but an excellent crop was produced.

Hot caps or paper protectors for early set peppers, tomatoes and other tender crops do not seem to be finding as great popularity in the East as in the West. Possibly this is partly the result of some makes of paper plant protectors collapsing or breaking down in our more humid and showery climate. As a rule a certain amount of ventilation must be provided by slitting the tops of the protectors.

G. S. W.

Always a Great Value
... now greater than ever!

The McCormick-Deering 15-30—now selling at the lowest price ever—is the latest, most modern triple-power tractor. It is a big, easily controlled, fast-working tractor conservatively rated at 22 h. p. at the drawbar and 36 h. p. at the belt. Its heavy-duty power can be applied in three ways—through drawbar, belt, or power take-off. Supplementing the 15-30 is the husky triple-power 10-20 popularly used the world over.

International Harvester Announces IMPORTANT REDUCTIONS IN TRACTOR PRICES

STEADILY-INCREASING popularity of McCormick-Deering Tractors throughout the world has made possible the announcement of new low prices at the season when the greatest number of farmers are actually in need of new tractors. The big, powerful McCormick-Deering 15-30 is now offered at the lowest price ever—the husky McCormick-Deering 10-20 is now priced the lowest in years.

Economies of Large-Scale Manufacture Passed On to Customers

In keeping with International Harvester policy, the economies effected

through large-scale, modern manufacture are being passed on to farmers in the form of substantial price reductions.

You who have been planning to buy a tractor at some time in the future can now save considerable money and begin at once to reap the many advantages of abundant, dependable, low-cost power.

The nearby McCormick-Deering dealer is ready to show and demonstrate these current-model McCormick-Deering 15-30 and 10-20 Tractors. Ask for the new low price quotations the next time you are in town.

SCARFF'S BERRY PLANTS
Grown in the Heart of Ohio
1400 acres of most fertile soil. Small fruit plants and ornamentals especially. Healthy, vigorous stock.
Viking Red Raspberry—Latham Red Raspberry—Van Fleet Red Raspberry—Youngberry (Young Desbross)—New Logan Black Cap—more resistant to mosaic—Calla Beauty Apple—red strain of Rome.
These outstanding new varieties are the best of the standard kinds are fully described in our new catalog.
EVERGREENS—Beautiful, your choice—Flowering Shrubs—Trees—Roses—Ferns and Hedge Plants. Our assortment of varieties is complete and prices reasonable.

SCARFF'S SEED CORN
CASH—Very early, heavy yielding, deep grain, small cob, medium stalk, fine feeding corn.
CLARAGE—Mid-season variety, produces well, good grain, medium to large fodder, general favorite.
Also, Blue Clarage, White Cap, Early Mammoth, Heide Yellow Dent and End-lage varieties. Send for FREE Copy of our Catalog. Everything for Farm and Fruit Garden.

Box F-30 New Carlisle, Ohio

EDWARDS METAL ROOFS
Greatest Values—Lowest Prices
DURABLE—Roof your house or barn with Edwards Metal Roofing, and it's roofed for good! Fire-proof, rust-resisting, lightning-proof, wind and weather-proof. Pure steel, painted or galvanized, or Edwards famous rust-resisting, copper-bearing steel.
BEAUTIFUL—Styles for every purpose (divided, cluster, Spanish tile), sheets (plain or corrugated, v-shaped or standing-ridge).
ECONOMICAL—Our roofs and sell direct to you at amazingly low factory prices. Thousands of farmers have found Edwards Metal Roofing the permanent solution to the roofing problem. You will too. Write for free samples, prices and Brochure Book No. 1391.
The Edwards Manufacturing Company
4241-4281 Butler St. Cleveland, Ohio

DON'T WORK FOR THE CROWS

Planting corn once is job enough. Why let crows and rodents make you do it twice?

Treat your seed corn with LIBERTY CROW SCAT. It's guaranteed to keep crows away or it costs you nothing.

CROW SCAT is non-poisonous—harmless. It won't clog the planter; won't hurt the seed. In fact, it assures maximum germination. Easy to use.

1½ pint enough for 1 bushel seed \$1. 1 pint enough for 2 bushels \$1.50. Order today but SEND NO MONEY. Pay postman on arrival. We pay postage. Remember your money back if CROW SCAT doesn't keep crows away.

Apothecaries Hall Co., Dept. FF4, Waterbury, Conn.

Send me pint (state quantity) CROW SCAT. I'll pay postman on arrival. We pay postage. Remember your money back if CROW SCAT doesn't keep crows away.

ADVERTISEMENTS

are short-cuts to finding out truths. The truths about everything you want to buy. The names in advertisements are names of solid reputation. The labels in advertisements are symbols of satisfaction. It pays to read the advertisements, for then you know what is good. The products they tell you about are being bought, tested constantly. The fact that they're still being advertised is alone proof of their worth.

Top view of a cover-crop disk which has 22-inch disks spaced nine inches apart.

Potato Machinery

By R. U. BLASINGAME

It appears that potato growing in Pennsylvania, among the 400-Bushel Club, has been reduced to a formula. Machinery plays an important part in this program.

Here is about the list of equipment being used by these growers:

1. Tractor—a two and three-plov size.
2. Chisel or orchard harrow, sometimes called "jostler."
3. Tractor plow.
4. Tractor cover-crop disk, 22 inches in diameter, 9-inch spacing.
5. Two or one-row planter which will plant three to three and one-half inches deep and cover shallow—either automatic or assisted feed.
6. Weeder, either horse-drawn or tractor operated.
7. Water tank located on a platform in the field above the sprayer having a three-inch valve and a fire hose for filling the sprayer rapidly.
8. Lower platform with several 50-gallon wooden barrels filled with copper sulphate solution, also barrels (can be steel oil drums, 50 gallons) filled with lime solution.
9. Power sprayer, six to eight-row boom; one horse power for each row sprayed, and a pump capacity of at least two gallons of spray per minute for each row sprayed at 250 to 300 pounds pressure.
10. Water pump and pipe line to the elevated tank in the field.
11. Cultivator, either horse-drawn or tractor.
12. Potato digger equipped with an engine, operated by the tractor power take-off or driven from the ground.

Deep Seedbed

Some potato growers disk down soy beans in the fall and follow with the chisel. The next spring they disk and chisel again at planting time, not using a plow at all.

Others plow down the soy beans in the fall, chisel and disk in the spring. Others plow both fall and spring and disk, then chisel at the time of planting.

Planting

Over half of the 400-bushel growers employ the same make of potato planter. It has two disk openers in front. The fertilizer is deposited on each side of the row and a shoe run-

ner opens the furrow into which the seed is deposited. This is followed by two disk covers which may be set to cover shallow or deep. The shallow covering seems to give best results because the potatoes come up quickly, having little soil to push through, and the heat of the sun causes rapid sprouting of the seed.

Cultivating and Weeding

Before the potatoes come up it is often the practice to run the weeder. This kills out small weeds which would become troublesome. In fact, the weeder is run every week until the potatoes are ten to twelve inches high, "then weed a few more times."

Just before or about the time the potatoes begin to appear so that the rows can be seen, cultivate as deep as possible. After this cultivate as often as necessary to loosen up the soil so that the weeder will take effect. The weeder does not kill weeds if the soil is packed down too hard, thus the cultivation. And, of course, cultivation takes out some of the large weeds which the weeder will not handle.

Spraying

It appears that the growers who are getting the big yields are employing power sprayers of about the following specifications: (a) Develop from 250 to 300 pounds pressure; (b) one horse power for each row sprayed in engine capacity (six-row sprayer should have a six h. p. engine); (c) pump to deliver about two gallons or more of spray per minute for each row sprayed; (six-row sprayer, for instance, to have a pump to deliver at least 12 gallons per minute); (d) some kind of efficient vine turner to protect the potato plants from the wheels; (e) three nozzles to each row.

Begin spraying as early as the rows can be seen and keep it up every week to ten days with Bordeaux mixture. By the way, the spraying should follow the weeding and cultivating so that the spray will not be shaken off the vines.

Mr. J. S. Wile, Montgomery county, says that he pumped the water for his 80 acres of potatoes last year, for each spraying, for about \$1 worth of electricity. He applied at least 100 gallons per acre (100x50) or 8,000 gallons for each spraying.

This farmer with his general-purpose tractor sprays eight rows of potatoes at one trip, using power take-off machine.

Kill Rats Without Poison

A New Exterminator that
Won't Kill Livestock, Poultry,
Dogs, Cats, or even Baby Chicks

K-R-O can be used about the home, barn or poultry yard with absolute safety. It contains no deadly poison. K-R-O is made of Squill, as recommended by U. S. Dept. of Agriculture, under the Connable process which insures maximum strength. Two cans killed 578 rats at Arkansas State Farm. Hundreds of other testimonials. Sold on a Money-Back Guarantee. Insist upon K-R-O, the original Squill exterminator. All druggists, 75c. Large size (four times as much) \$2.00. Direct if dealer cannot supply you. K-R-O Co., Springfield, O.

Read the Advertisements

Advertisements give you a high point of view without any climbing at all. They spread world products before you—servants to serve you, conveniences to please—prices low because so many thousands are using the same. They give you a new conception of what you'd like to own. No longer will a watch or food chopper do—but the highest improved watch or food chopper. No longer just a radio—but one of purest transmission. They make you change your mind about what you started to choose, and choose something more pleasing at no higher price. They help you see the whole field of satisfying wares. They lift you to fresh joys.

The Story of Woodbine Farm

By W. D. ZINN

SPeAKING of the one-crop rotation that has been the curse of Virginia agriculture, we saw thousands of acres of second growth timber standing which doubtless were 40 to 50 years old, and the tobacco or cotton rows could yet be seen in the forests. The land had been cultivated to these crops so long as it would grow anything, and then it was turned out for nature to improve it; and it was doing it by the trees shedding their foliage year by year. A slow but sure way to restore a soil.

Slavery has been a curse to Virginia, for on account of it some men have grown up with the idea that manual labor is undignified. At one of our stops I told how, with my own hands, I had ditched my little farm. A son of a slave-holder came to me after I had given my talk, and said, "I beg your pardon, but allow me to suggest that you do not mention the fact any more that you dug those ditches with your own hands. We think that is work that belongs to the colored man."

To which I replied, "My friend, if I had not learned to do all kinds of work that is done on my farm I would not be here today." I am glad to believe that there are few men and women in Virginia who have that notion of labor today.

The Civil War devastated a great deal of Virginia, but it is getting back on its feet again. All over the state the traveler can see the earmarks of prosperity. I was sent by the commissioner to Albemarle county, Virginia, into a rural district to hold a one-day institute. No meeting of the kind had ever been held there. Arriving before the hour of the meeting I went into a store at the crossroads. I introduced myself to the merchant, telling him for what purpose I had come.

The Squire's Question

He said, "Yes, your meeting has been advertised, and you are going to have a good crowd. Let me tell you something, confidentially. A crowd of farmers was in the store a few nights ago, and they said, 'This man is coming out here to talk to us about farming, and he no doubt does his farming on the third floor of a brick building in Richmond. Let's see if we can't floor him on the first round.'"

"Then," said the merchant, "they organized, and elected Squire . . . as their spokesman." He described the man so that I might know him.

The hour of the meeting arrived, and I took up the subject of soils, and proceeded to discuss it in my usual way. I finally came to the subject of plowing, and the Squire, whom I had already picked out, held up his hand, and said, "May I ask you a question?"

"Certainly," I said, "I should have told you at the beginning to ask me any question you desire at any time."

"Did you ever plow an acre of ground in your life?" inquired the Squire.

I replied, "You take me to be a book farmer. I wish I knew more about book farming than I do, but if you will come over to Philippi, W. Va., and my neighbors do not tell you that I have done all the different farming tasks with my own hands for the last 30 years I will pay your transportation over and back, and will entertain you the best I can as long as you care to stay."

The crowd listened very attentively. After the meeting was over the Squire came to me and said, "I believe you are all right."

"No, I am not 'all right,'" said I, "but I am a farmer."

At that time there was held at Richmond what was called the State Fair. During the different fairs the commissioner, Mr. Koiner, had me to attend and take charge of the agricultural booth which the Department

(Continued on page 28.)

PENNSYLVANIA

Clarion-Forest County

John C. Bostaph Farm—No. 15432—56 acres.—Located on public road leading in a northeasterly direction ½ mile from Vowinkel, the nearest railroad station and shipping point; ½ mile to nearest school and ½ mile to nearest church. Contains 49 acres suitable for cultivation, balance in pasture. Buildings consist of main dwelling, main barn. Soil is clay, watered by spring. Farm adapted to the growing of corn, oats, wheat, potatoes, hay, etc. Sale price \$2,100. Cash \$450.

PENNSYLVANIA

Indiana County

Charles L. Dick farm—No. 20193—94 acres.—Located on public road 1½ miles to Clymer, the nearest railroad station and shipping point; 1 mile to nearest church and ½ mile to nearest school. Contains 90 acres suitable for cultivation, balance in timber. Buildings consist of main dwelling, main barn. The soil is shale, watered by spring. Farm adapted to the growing of corn, oats, wheat, hay, buckwheat, etc. Sale price \$4,000. Cash \$800.

PENNSYLVANIA

Potter County

Jacob E. Ridgway farm—No. 12736—271 acres.—Located in fair farming region, 7 miles east from Coudersport, 2 miles to Seven Bridges, nearest shipping point and railroad station, 1 mile to school and church. Contains 150 acres in cultivation, 37 acres in pasture, 50 acres in cut-over, 30 acres in timber and 4 acres in orchard. Wood dwelling, other dwellings, main barn, other barns and outbuildings. Red and gray shale soil. Watered by natural springs for domestic use. Farm adapted to growing usual crops of community. Sale price \$4,000. Cash \$800.

PENNSYLVANIA

Clearfield County

Leland J. Newell Farm—No. 3719—58 acres.—Located on new concrete road being constructed within about ¼ mile from Sabula to Penfield, ¼ mile to nearest church and ¼ mile to nearest school. Contains 54 acres suitable for cultivation and 3 acres in woodland. Buildings consist of dwelling with fair slate roof and main barn. The soil is of gravelly loam, fair fertility, watered by springs and well. Farm adapted to growing of general crops of the community. Sale price \$2,000. Cash \$400.

PENNSYLVANIA

Crawford County

William Hoffman farm—No. 8340—130 acres.—Located 2½ miles from Shadeland offices (joins this development), 2½ miles west from Springboro, the nearest depot (R.R.), 2½ miles to school and 3½ miles to churches and milk station. Contains 100 acres suitable for cultivation, 10 acres suitable for pasture and 20 acres in woodland. The buildings consist of a 9-room frame dwelling. The soil is clay and of good fertility. The farm is watered by spring and well, and adapted to growing corn, oats, buckwheat, wheat, potatoes and hay. Sale price \$3,200. Cash \$600.

These Farms ARE BARGAINS

THE balance between the cash payment shown and the sale price can be obtained by mortgage running for a period of ten years, with installments paid annually, plus 6 per cent interest.

PENNSYLVANIA

Erie County

Stephen W. Burleson farm—No. 2699—255 acres.—Located 4 miles west from Albion, the nearest town, and ¼ mile from cement road, 1 mile to nearest railroad depot and nearest school and 3 miles to nearest churches and milk station and cannery. Contains 125 acres suitable for cultivation and the balance in pasture. The buildings consist of 8 room dwelling and 2 barns. The soil is clay loam and of good fertility. The farm is watered by wells and adapted to growing hay, grain and potatoes. Sale price \$6,000. Cash \$1,000.

PENNSYLVANIA

Tioga County

Eugene Wilson farm—No. 3660—222 acres.—Located on County road leading in a westerly direction between Wellsboro and Pine Creek, nearest railroad and shipping point; nearest station is 5 miles, Post Office 9 miles; 2 miles to nearest school and 1 mile to church. Contains 222 acres suitable for cultivation and pasture. Buildings consist of dwelling house, main barn. The soil is red shale and of good fertility; watered by springs. Farm adapted to the growing of general crops, such as hay, oats, corn, wheat, potatoes and buckwheat. Sale price \$2,300. Cash \$300.

List of other farms in Maryland, Virginia and Pennsylvania sent upon request.

Seeds of Ideas

ADVERTISEMENTS are selected seeds of ideas planted in the soil of your mind. If cultivated thoughtfully, these ideas will produce greater comforts and better methods of accomplishing your aims. These selected seeds of advertising can help you to live more fully at less cost.

The advertisements in this publication are a record of what the manufacturers are doing for you. They will give you many new ideas and will tell you what you want to buy. And they will help you get the most for your money.

The advertisements are news. They are interesting. Form the habit of reading them carefully and regularly. It will pay you to keep informed of the daily progress of business.

For full value—buy standard products. Manufacturers stand back of advertised goods.

READ THE ADVERTISEMENTS TO RECOGNIZE PRODUCTS THAT ARE WORTHY OF YOUR CONFIDENCE

THE YOUNG PEOPLE

More Queer Pets

Built His Winter Home

ONCE upon a time I found a strange little creature and I took it home for a pet. It was not a dog or a cat or a bird. It was a mud turtle and it lived several years with us. There was a date cut on the under side of its shell—March 22, 1692.

Of course somebody cut it on him not many months ago for a joke. I called him Skeezix and he knew his name and would follow me. I had a pet cat too. Skeezix and the cat were great friends. They would eat out of the same dish and not say a word. Skeezix was fond of green food. When he would go in the garden he would eat everything green that he would happen upon whether we liked it or not.

Skeezix's chain was fastened through a hole in the back part of his shell, but he soon grew so strong that he broke away from his chain one day and left a piece of his shell still hanging to the chain.

Every year in October Skeezix went off. No one knew where he went until the spring. Then a little heap of earth would be found near a hole. Here Skeezix had spent the winter. The hole was at least two feet deep. If the winter was very cold he would go down deeper.

In the spring Skeezix would always come out of his winter home all covered with mud. He would come waddling towards the house puffing and blowing like he had asthma or mud fever. He would come straight on in the house hunting his playmate, the cat, dripping mud all the while. The family would welcome him, but I had to wash the untidy pet. Then he and the cat would be as friendly over their bread and milk as they had been the year before.

But this couldn't last for ever for one day I saw that old age, asthma, mud fever or something was about to get the best of him. He refused to eat. All kinds of good food was offered him but he wouldn't touch it. At last he was found dead in one corner of the kitchen. One thing that seemed so queer was the liking he and the cat had for one another. The cat, which was Skeezix's best friend, sat by the side of her friend and pawed his shell for hours refusing to eat, meowing piteously. No one could doubt that she loved him very tenderly.

West Virginia. Everett Craddock.

Ducky Doollittle, Nursemaid

I HAVE a pet duck. His name is Ducky Doollittle. He is black, white and brown and he wears a long yellow bill.

He was hatched under an old hen out of a duck egg. Of course, you wouldn't expect him to be hatched out of a turkey egg, or goose, or hen egg, would you?

He was the only duck in Mother Hen's family of seven children. When very young he formed a habit of running away to swim in the creek. Mother Hen would run up and down along the bank squawking and clucking as if he were already drowned, while Ducky Doollittle would paddle about as if he were doing it to tease her.

Mother Hen finally became used to it and would busy herself hunting for insects for her baby chicks near the water.

Ducky Doollittle is now four years old. Every year when Mother Hen raises a brood of chicks he can always be found near by, and I hate for them. At night he sits with some of them under his wings and sits contentedly sheltering them.

One thing seems to be a mystery. He can't coax the baby chicks into the water. Orlena Lorraine Flinn, West Virginia.

"Jenny Wren"

ONE bright morning in June, as I lay awake in my bed, I heard a bird singing. It sounded very near to me. I looked out of the window and there on the window ledge I saw a little wren. It seemed to be telling me something for it was looking right at me.

I lay still and watched it but it soon flew away. It returned shortly afterwards with some twigs. This sure did surprise me, for I thought it was coming into my room with them. But it suddenly disappeared behind my shutter. I dressed at once and then looked behind the shutter. There I saw quite a few twigs. Then I knew I was to have company.

This wren did not seem to be afraid of me at all. It seemed strange how we became friends. Every morning and also during the day the wren sat on my window ledge and sang. I soon began to put bread crumbs on the sill and they were soon found by the wren. I used to stand at the window and watch it build its nest but it did not fear me.

It soon finished its nest and before very long I had some more company. I picked cherries and also berries and put them out for it. The wren was always sure to find them. At last it became so friendly with me that it took cherries out of my hand.

The wren's family soon left the nest but the mother wren often returned to my window ledge. At last my strange pet left me but I have hopes that it will return again this spring.

Pennsylvania. Robert Reihman.

Quack! Quack!

I AM a little girl ten years old. I have two pet ducks. I wish you

could see them. They will eat from my hands. When they were small I put them in a box every night. Last summer they were afraid when it thundered. They wanted to come in the house and hide under the bed. When I put on my shoes they would try to take them off. I call them Alex and Patty. They are pretty pets, and I love to feed them.

West Virginia. Gertrude Hopkins.

Likes Fresh Meat

I WILL tell you of the queerest pet I ever had. It was a large black spider. It had a web across a window in our basement. My brother and I would catch flies for it and it would watch for us and then dart out and get the flies. It would not take flies if they were dead; we had to have live ones. We did not fondle our pet but it was very interesting to watch.

Pennsylvania. Vernon Mardis.

Be Kind to Animals

THE Be Kind to Animals Anniversary which is being celebrated this week through newspapers, radio and schools, has a worthy motive in seeking kindly treatment of dumb creatures.

Balaam's ass spoke thus: "What have I done unto thee that thou has smitten me?" Your horse might wish to say:

"Please keep the harness from that sore until it heals."

"That sore spot feels better now since you have bathed and treated it."

"Wait; that cold bit is awful."

"Easy now, this street is very slippery. How about new corks?"

"Why did you hit me when I stumbled?"

"A good, clean bed will save time cleaning me."

"Clean me well, and I will feel better, look better and work better."

"Remember, keeping me good looking is

Before the Pet Lamb Grew Up.
By Inez Mellett, Pennsylvania

good advertising, adds to your dignity and to my comfort.

"I want a blanket when standing; temperature below 40 degrees; in windy places; below 50 degrees; when heated from work; below 60 degrees; in cold stable; below 30 degrees."

"When I fall, loosen the harness and push the wagon back. Hold my head until all is ready, then assist me to rise."

"I want enough good, clean hay. To me it is the bread of life. Three good feeds and water frequently on hot days help me feel well, look well and work well."

"Try me without blinders. You may find that we both will be happier."

"Your whip hurts me and degrades you. It is a bad habit."

"Give me the gift of the Golden Rule."

A CORRECTION

The first prize in our recent cartoon contest "When the Pet Lamb Grew Up," should have been credited to Marvin Detweiler instead of Mercy Clark.

FLOWERY ROMANCE

YOUR seed catalogue will be a great help in finding the names of these flowers. Five book prizes will be given to the ones who send in the correct answers accompanied by the most interesting letter, poem or picture on any subject.

Address: Contest Editor, Pennsylvania Farmer, 7201 Penn. Ave., Pittsburgh, Pa.

1. The heroine's name and the color of her hair. (one flower.)

2. The hero's name and what he wrote with. (one flower.)

3. Their favorite pastime in winter.

4. What he did when he proposed.

5. The ghastly trophy which he offered her.

6. What she said when he knelt before her.

7. The person to whom she referred him.

8. The hour for the wedding.

9. The maid-of-honor and the color of her eyes.

10. The disposition and name of the best man.

11. The four bridesmaids.

12. The color of their dresses.

13. What the bride wore in her hair.

14. What she wore on her feet.

15. The clergyman.

16. The number of guests that attended the wedding.

17. The minister's fee.

18. The length of their happiness.

Little Folks

WHAT IS COMING?

NOW all you small folks under twelve, here is the very easiest puzzle we have had. When you read these sentences you'll think the editor has been very careless indeed to leave out so many letters. But look again! This is where you come in. Read over each word carefully and put down the missing letters on a sheet of paper. They should spell two words. Send your answer back immediately to Little Folks' Corner, Pennsylvania Farmer, 7201 Penn. Avenue, Pittsburgh, Pa., with a letter telling what you are going to do when you grow up. There will be surprise prizes for the ten best letters and correct answer to the puzzle. Be sure to write plainly, give your name, address and age.

Missing Word Puzzle

1. Have you seen Mary's new hat?
2. These spring days are so nice.
3. Millions for defense, but not one cent for tribute.
4. Do you slute the flag?
5. Stand up straight and all.
6. Don't give up the ship.
7. Soon roses will be blooming.
8. It is an interesting sight to see.
9. Happy days are here again.
10. Did you pass your examination?
11. Be sure to write plainly.
12. Think before you speak.

PRIZE WINNERS

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1. Despite the abolition of the famous White House stables, Mrs. Hoover has become an enthusiastic equestrian and is frequently seen galloping along the bridle paths of beautiful Rock Creek Park at Washington, accompanied by house guests and a young cavalry officer of the White House staff.
2. Boston, Mass.—An excellent view of the C. S. S. Northampton, which was christened a few months ago by Mrs. Coolidge, wife of the former President, in drydock at the Charlestown Navy Yard for a painting and cleaning.
3. Aldenham, England.—Photo shows prize pigs at the farm of J. P. Morgan, American capitalist, near Watford, where preparations are afoot for the coming stock shows.

4. Carbon Hill, Ala.—Photo shows footprints of the newly-named, "Cincosaurus Cobbi," found in the hard carbonaceous shale about 30 inches above the Jagger coal seam in Mine No. 11 of the Galloway Coal Co., of Memphis, Tenn. The discoveries in this mine are considered by prominent geologists to be among the oldest and best preserved tracks of prehistoric animals.

5. Speaking from the Cabinet Room in the Executive Offices at Washington, President Herbert Hoover recently inaugurated direct telephone communication by radio between the United States and Argentina, Chile and Uruguay.

Photo shows, left to right, Dr. J. Valera, Uruguayan Minister to the United States, Acting Secretary of State Joseph P. Cotton, President Hoover, Walter S. Gifford, President of the American Telephone and Telegraph Co., and Sosthenes Behn, President of the International Telephone and Telegraph Co.

6. Pasadena, Calif.—Photo shows right, Curtis W. Willock, formerly of New York, about to drive before stepping into his new "self-electric" to drive to the next shot. Advised by his physicians to avoid undue fatigue, Mr. Willock refused to give up his favorite game, but compromised by having this trim little electric car built to carry him between long shots. The novel car will do 11 miles an hour and cost \$1,500 to build.

Concrete for Your Dairy Barn Floor

Concrete is the most economical and durable sanitary material for your dairy barn floor.

A concrete floor is an important aid in ridding the barn of infectious diseases such as tuberculosis and contagious abortion—for it is readily disinfected.

And your time in performing daily routine chores is lessened by concrete floors for they are easier to clean.

Free Construction Plans
Your County Agricultural Agent has a new, four-page leaflet describing how to build a concrete floor and containing plans.

Ask him for your free copy or send the coupon.

New Ayrshire Inspector

THE Ayrshire Breeders' Association has appointed Tom P. Whittaker of Bradford, Pennsylvania, to the newly created position of Herd Test Inspector. Mr. Whittaker will visit breeders doing herd testing, checking feed, production and registration records. In addition, he will cooperate with testers from the various colleges and dairy herd improvement associations, in an effort to improve the technique and methods of the Ayrshire Herd Test.

Mr. Whittaker graduated in 1929 from Pennsylvania State College, where he specialized in dairy husbandry. Since graduation he has been in charge of the Allegheny county, Pennsylvania, dairy herd improvement association.

Garlic

By L. W. LIGHTY

IT ruins the milk and it ruins the wheat. The cattle are very fond of it and run over the field in search of it. An inquirer wants to know all about it. He has heard it can be eradicated. He has also heard that the garlic flavor can be taken out of the milk.

After we have spent millions and made billions of noise about the corn borer, conservative scientists tell us we have to learn to live with it permanently. That is the way with the garlic in your fields. We can reduce it very greatly. Fall plowing, winter stirring of the ground if possible, clean culture with a hood crop will seemingly put it out of commission, but in a few years you will see some garlic again and the fight has to continue.

I have worked and watched the game over two score years; the garlic still shows up when conditions favor, but not enough to do great damage. Small clumps can be greatly discouraged if given a heavy dose of kerosene and then covered with salt. All grasses are killed of course, but the garlic will not show up in that place any more.

Presumably the garlic flavor can be removed from milk, but like changing gross metals into gold it is more theoretical than practical. Under ordinary conditions if the cows are taken off the pasture three hours before milking and the milking done in a well ventilated place the flavor will hardly be noticed. The more garlic bulletins I consult the more confused I become as to the varieties of garlic, but in the end it all smells and tastes the same, and that is where our troubles arise.

"Folks Are Queer"

That was the remark of a visitor I had lately.

He said, "Veal calves are my milking machines. I keep ten to fourteen cows and often have eighteen to twenty calves taking the milk and making splendid vealers. Many of my neighbors want to sell all the milk as soon as it is good after freshening. I buy the calves, they sell the milk and I

Spending millions locally

THE nation-wide business of Swift & Company should not be allowed to obscure its local character. This is explained in an interesting way by the new Swift Year Book.

For example, in the state of Iowa alone, Swift produce plants pay about \$20,000,000 a year to farmers for butterfat, eggs and poultry.

Similarly, Swift packing plants, cotton oil mills and refineries, and other units figure largely in the economic life of their communities. They bring millions of dollars into the states where they are located.

Swift & Company plants buy raw materials in quantity, and the money so spent remains in the community. These plants purchase many other goods and services locally, just as other home industries do.

Moreover, these units employ thousands of local citizens. These employees spend their money locally and many of them own

their homes. They are working to encourage good citizenship, and to develop their local communities into better places in which to live.

Send for Year Book

Farmer's Business Letter

A DEVELOPMENT of the first rank in the agriculture of the Corn Belt this week was the coming of rains to break a drought that was becoming extensive and serious. Hot, dry weather was accompanied by high winds and in some places there were dust storms exactly like midsummer. All sections received rain except the western counties of Kansas and Oklahoma. Hundreds of thousands of acres of wheat were saved, though severe injury had already taken place. The rains had a bearish effect on wheat prices.

Some little corn has already been planted in west central Illinois, the season having been extraordinarily favorable for field work, but generally farmers do not choose to plant earlier than May 1.

Wheat prices have gone off a dime from the recent high point, due mainly to the more favorable turn in the weather. The trade seems to expect lower rather than higher wheat prices in the coming crop. The carry-over promises to be large, and the export outlook is not expected to be good.

Corn has been weak. While receipts were light this week, they have been rather more liberal than expected, with shipping demand only fair.

Attack Farm Board

The fight against the Farm Board came out in the open this week. It was announced that the Minneapolis Grain Exchange had started a campaign among all grain, produce and commodity exchanges of the country in an effort to bring pressure to bear on the United States Chamber of Commerce to put that influential body definitely against the Farm Marketing Act.

The Memphis Cotton Exchange has asked Congress to start an investigation of the Farm Board. In a resolution the exchange asserted that the Board "appears at present to be devoting its attention to artificially elevating prices in defiance of the law of supply and demand."

"It appears that this manipulation has resulted in almost complete cessation of the demand for actual cotton from mills and merchants," the resolution charged. "... It has undermined the confidence of the mill and foreign buyers in the stability of our exchanges and marketing system and has seriously interfered with the distribution of the present crop."

After three months of service W. G. Kellogg has resigned as president of the Farmers' National Grain Corporation and as vice-president of the Grain Stabilization Corporation, the Farm Board's wheat marketing agencies, because "of the pressure of other affairs."

Storage Stocks

Stocks of lard and pork in store in Chicago on April 15 were less than half as large as on the same date a year ago. For the entire United States the latest figures are for April 1, issued this week. The report shows a total of 105 million pounds of lard, against 179 million a year ago, and an average of 136 million pounds for the past five years. Of pork, the April 1 stocks in the United States amounted to 753 million pounds, comparing with 922 million pounds a year earlier, and 823 million pounds, the average for the past five years. These storage figures are strongly on

the favorable side of the hog market, and would have considerable effect on prices if general business conditions were better.

Hogs Lower

With only moderate receipts the hog market worked a little lower this week. Eleven markets had 468,000 hogs, against 483,000 last week and 512,000 the same week last year. Average price for the week, at \$10.10, compared with \$10.25 last week and \$11.40 a year ago.

Weights are fairly strong, average this week being 237 pounds, against 235 last week and 240 a year ago. In the hog futures market, prices in the main were a little lower than last week. April lights sold at \$10.50 to \$10.60, May lights at \$10.50 to \$10.75, June lights at \$10.35 to \$10.40, and September lights at \$10.40 to \$10.50. Heavy hogs for June delivery sold at \$10.10, and for September delivery at \$10.40.

Farmers who have been picking up hogs in the country report paying 10 to 10 1/2 cents for shotes weighing 80 to 90 pounds, with not many available.

Lamb Feeders Hard Hit

Reports from Colorado and Nebraska indicate that the lamb feeders of

those states still have half a million lambs to market, with the first of the California spring crop due next week. It is a discouraging situation. Losses have been running \$4 to \$5 a head, and it is figured that at least half of these big feeders will be unable to finance feeding next year. If this proves to be the case, the demand for feeding lambs will be sharply reduced, unless other feeders make up the difference, which seems unlikely. As yet no lambs have been contracted for fall delivery, which is unusual.

There is some price talk. The feeders are talking five-cent lambs, and the producers ten-cent lambs. The price level come fall will no doubt be somewhere between \$10 and \$11. In all, it would appear that there may be some bargains in the sheep market for those inclined to stock up.

Further Decline in Lambs

The lamb market went off again this week, the decline being 50 to 75 cents, and in some cases as much as \$1 at the close. Average lamb price for the week was \$9.10 against \$9.47 a week ago and \$17.10 a year ago—a decrease of exactly \$8 compared with a year ago.

Receipts were largest in some times—98,700 here, of which no less than 70,000 were Colorado-fed lambs. Sheep were off with lambs, the decline being 25 to 50 cents. There is complaint that

the reduction in lamb prices has not been fully reflected in retail shops, and figures are presented to show that some retailers are asking nearly as much for lamb as they did a year ago.

Decline in Cattle

It was a very light week in cattle marketing—\$4,500 here against \$4,500 a year ago. In spite of this the market was weak, almost demoralized some days. Some recovery took place at the week-end, on runs that were exceedingly small. At that, light steers, which were in poor demand, were 50 to 75 cents and in some cases \$1 lower, with heavy, finished steers, which are scarce, closing about steady with a week ago.

Average steer price this week at \$11.85 compared with \$12.10 last week and \$13.75 a year ago. Best heifers sold at \$14.75 this week, and best yearlings at \$13.75. Bulk of steers sold at \$10.75 to \$11.75, against \$10.75 to \$13.50 last week, \$13.50 to \$14.50 a year ago, \$11.75 to \$13.50 two years ago, these prices being the highest paid for cattle back to 1920.

The cattle trade is pessimistic, due to business depression and the belief that there will be plenty of beef during coming months.

Cottonseed Meal

A report from Memphis, Tenn., says that stocks of cottonseed meal west of the river are barely adequate to supply local demand for the balance of the season, and cannot be considered as a source of supply for northern and eastern consumption. In the South, east heavy buying of cottonseed meal by fertilizers and disappointing seed receipts have greatly reduced stocks of cottonseed meal, and mills have been buying back their contracts. This has turned the southeast from being the weakest spot in the market to the strongest, and mill offerings have practically dried up from that section.

Chicago, April 19, 1930 Watson

WOOL MARKET

Boston, April 18.—The bulk of the business reported for the current week on domestic grease wools has been on 58s, 60s and 62s. Territory wools, says the U. S. Department of Agriculture Market News Service, only moderate quantities, however, have been sold. Prices were about 10 percent lower than last week. Improvement was reported in the demand for wools suitable for the woolen trade. Limited sales were closed on spot offerings of some Australian wools at fairly high prices. According to private cables, dealings from the primary markets are firm with American operators continuing to show only limited interest.

Fleece wools were very quiet. Only restricted offerings of 64s and finer fleeces are available and quotations therefor are only nominal. Scattered inquiries were received by some dealers on the 58s, 60s, strictly combing qualities but no sales were reported.

The movement of wool both in the West and the bright wool is reported sluggish. Around 75,000 lbs. of Texas wool was sold last week at 27c for 12 months and 25c for 24 months. In the bright wool sales very little wool has been sold or consigned.

The Story of Woodbine Farm

(Continued from page 17.)

had on the grounds. It was my duty to welcome the people who came into the booth and to answer the many questions the visitors asked, if I could. We had all kinds of grains, vegetables, fruits, tobacco, cotton and bales of timothy, clover and alfalfa hay. At a particular moment there was no one in the booth when a tall slender man wearing a light hat and a gray suit of clothes stepped in and began to pluck at the alfalfa.

"Are you interested in alfalfa?" I asked.

"Somewhat," was his reply. Then I began to expatiate upon its wonderful qualities. To which my listener would exclaim, "Is it possible?"

About the time I was concluding my little speech I said, "But you cannot grow this wonderful plant without inoculation."

"Now just what do you mean by inoculation?" my visitor asked.

Then I went on to tell him that alfalfa could not get enough nitrogen out of the average soil and that it must be assisted by certain bacteria that live in the nodules on the roots of the alfalfa, but these bacteria are not always present in the soil and must at times be put into it by the process called inoculation. Then he began to ask me some questions from which I came to the conclusion that he knew too much not to know about alfalfa. In other words I made up my mind that he was just trying to find out how much I really knew about alfalfa.

I finally said, "Where are you from?" and he said: "From Ohio."

"What is your name, please?"

"My name is Wing," he said.

I slapped him on the shoulder and said, "Joe, I have spent 15 minutes extolling the wonders of alfalfa to a man who has forgotten more than I ever knew about the plant."

It was the late Joseph E. Wing, who has done more to promote the growth of alfalfa than have any half dozen men in America. I had read his book and many of the articles which he had written on alfalfa but had never met the man himself.

In Ohio

I have done less institute work in Pennsylvania than in any other state in which I have worked, and yet I have been in more than twenty counties of this state. The institutes here were abolished some years ago. I have spent more days in actual institute work in Ohio than in any other state. In about 1904 I first went to the state, and worked for four winters continuously. At that time two-day institutes were held, and two speakers were sent to each place.

My first co-worker was C. R. Wagner, of Ohio, and my first institute was in Lawrence county. I have been back at this same point twice since that time. Mr. Calvert was then the Secretary of the Board of Agriculture and while I never met him during the four seasons of my work there, I want here to acknowledge my obligations to him for the courtesies he extended to me. I have never worked in any state where I felt that the authorities tried harder to get value received for the money paid the speakers, and for this they are to be commended. We usually spoke three times the first day, once at each session, and twice the second day.

One of the most enjoyable itineraries I ever made was in my own state with Mr. Alva Agee. It was in the months of August and September. We began in the northern part of the state, Wetzel county, and worked the river counties and some of the next tier of counties back from the river. It was not a busy time for farmers and the meetings had been well advertised. At almost every point we had large crowds. At some places the meetings were held in a grove in order to accommodate the crowd.

(To be continued.)

ADD WORKING HOURS WITHOUT ADDING WORK

HOW? By using ORANGE AMERICAN GAS--a gas which sells at the price of regular gasoline but which has so much extra power packed away in every gallon that it makes your tractor cover more ground every day from plowing-time to harvest-time.

ORANGE AMERICAN GAS is an all-round gas--the right gas for each and every motor on your farm! It's a gas which has exceptionally high anti-knock quality, a gas that has been thoroughly tested and has never failed to meet every test! Costs no more than ordinary gasoline--but does things no other gas selling at the price of regular gasoline can ever hope to do! Used with AMOCO MOTOR OIL or AMOCO TRACTOR OIL and AMOCO GREASES--it will be the most willing worker on your farm.

Stop at your nearest AMOCO dealer, call the closest American Oil Company branch or write us direct for further information.

Eureka

SPRAYERS

Traction or Power

Do the biggest, most important job in raising field crops and fruit. Increase yield 30 to 200 per cent. Improve quality. Insure investment by destroying bugs, preventing mold and blight.

Traction Sprayer has 1.2 or 3 nozzles per row; 4, 6 or more rows per boom. Wheels adjustable to width of rows, 60 to 100 gal. tanks. Double or triple action pumps. Thousands of satisfied users.

Combination and Power Sprayers for orchards, groves, and field crops, have 3 cylinder pump, pressure regulator; several sizes of engines and tanks for pressures 20 to 400 lbs. with spray booms and guns.

In stock near you. Write for Catalog on Eureka Sprayers

SHAW DU-ALL TRACTOR

Pays for Itself!

10-DAY TRIAL OFFER

Now you can try the SHAW at our risk. Use it 10 days on your own work. Write for full details of New Trial Plan and Low Factory Price.

The SHAW pays for itself in one season. Light, sturdy, easy to run. Does the work of 2 men. Economical--costs but 2 cents an hour to operate. Lends itself to many uses. Several models--all with full range of gears. Gauge wheel. Patented soil control. One guaranteed season's work.

2 Books Free--"Truck Grower" and "SHAW Catalog". Both filled with interesting pictures and valuable information. Postal orders both.

Shaw Mfg. Company
Div. P.F.A. Kansas
Galesburg, Kans.

Handy Reverse Gear--SHAW Tractors can be equipped with a reverse. Fine for plowing among roots, rocks, etc. Two speeds forward. Worlds of power.

A Correction

RECENT statement on this page regarding annuities should not have been made. Taxing methods vary widely among the states and some may tax the estimated values of annuities. I greatly regret my failure to recognize this fact. Any one interested should learn definitely the practice in his own state.

Inoculation of Clover

There is good station evidence that the use of inoculants on the seed of legumes should be far more general than it is. Nobody knows where the line should be drawn—never will know probably—but inoculation will come to be considered a form of good insurance wherever there is not certainty that the bacteria are in the soil in abundance. The presence of some nodules on a previous crop is not evidence that a supply of new bacteria would not add greatly to the amount of nitrogen that would be stored by the legume.

If a soil is acid, or if it has not grown the legume most satisfactorily within a few years, the seed should be treated. The cost is small, and the only difficulty is that of getting pure cultures of the sort needed. Discussing this question, Doctor Conn, of the Geneva Station, says: "The general conclusion at the present time, therefore, is that with the increased sale of commercial legume inoculants on the markets in New York, some form of adequate control is desirable in order to protect the farmer from worthless cultures and to assure him that he is getting his money's worth." Right here is room for service by our stations and departments of agriculture in all our states.

Lime and Clover

Bro. Lighty certainly knows how to put the truth before you. It cheered me up to read his recent article on lime and what it can do to soils and people. And yet there was regret that I have been remiss in duty in recent years. There was a time when a week seemed partly wasted if something was not said about the use of lime where needed. The same faith remains, but first I became afraid that readers were weary of it all, and then the habit of neglecting the subject was formed. But the need remains. Mr. Lighty well says that "millions of acres are lime-hungry and will respond generously when well fed."

Fineness of Limestone

The last annual report of the Ohio Experiment Station is chock full of dependable information. All of us recall the time when we put a little more faith in burned limestone than in raw stone even when we used them in the relative quantities per acre that the chemist said was right. Some people continue to have that preference. The Ohio Station has been determining the time needed by a relatively fine limestone to become available, using six soil types and making duplicate tests. It used material fine enough to pass through a 48-mesh sieve but too coarse to pass through a 65-mesh sieve. It found that four-fifths of high-calcium stone had combined with the soil acids in less than six weeks after the first heavy rain. That is quick enough for any one under usual conditions. Magnesian limestone was slower in its action.

It is good practice to use limestone that is not ground extremely fine, partly because it costs less and partly because it is a good thing to have a portion of the application becoming available later on in the rotation. An application of lime not only lets clover and other legumes grow, but when made to a decidedly acid soil it lets most staple crops get more plant food out of the ground. Lime paves the road to better days for the owner of acid land. We didn't know

much about this thirty years ago, but it has become one of the fixed facts in our agriculture.

Broadcasting Woe

A person has a right to be downhearted when occasion warrants, but there is too much broadcasting of woe. If one does not like many things lying in the wide range between the league of nations and carrots, he should say so if the saying is any relief to him, but the existence of these supposed evils does not forecast our doom as a great people.

We may line up on any side of any question, if conscience directs, but the fact that many things are not going as we would have them is no evidence that we are not gradually making headway on the right road. If one has the misfortune of becoming old, which is not a matter of years nor anything necessary in the scheme of things, he may incline to think that the former days were the better ones. He is wrong and the proof is abundant. More and more we place human rights above property rights, and that is a true index of progress in the right direction. The goal ahead is plain, everyday, practical, sane, human sympathy. A country and a people are safe when they are traveling the road running in that general direction.

Maple Syrup and Sugar

WHEN the records for the season have been turned in and totaled we shall be much surprised if the figures do not indicate that we have just had one of the best maple syrup and sugar seasons we have had in a long time. It opened early—one man we know of made some syrup before the January State Farm Products Show—and it has just ended, and tomorrow's Good Friday. Most of the makers have their buckets put away for another ten months.

The season threatened to cut short with several different warm spells, but again and again late winter returned for a day or two, and again good sap resulted.

The quantity made is fairly large. One man is said to have made 1300 gallons of syrup, and we've no idea how much sugar, at least 500 pounds, and perhaps a thousand. And that from 2,400 buckets!

The quality also has been extremely high. There probably was never so much real "fancy" syrup made in this year. One producer has over 80 gallons of high-grade syrup to his credit out of slightly over 900 made in all. Probably 80 per cent of the making this year will grade "fancy." That is a record of which he can well feel proud. Some of his best is just about as clear as water from the choicest woodsy stream which flows past his extra money for "fancy" over the next grade will amount to nearly \$100.

He is a large producer, his sugar house having 2,900 buckets up this year.

More attention has been paid to grades than has been the case in recent years. To assist interested parties in learning to grade their products the State Bureau of Markets for the first time furnished all those producers who wanted them with sample bottles which show the grades in which the product should be classified. These have proved very helpful to those who secured them.

The country south of the Canadian border was practically cleaned out of syrup and sugar when the season began, due to a poor season two years ago, and a worse last year. The result was that the season opened on price, with a retail price of \$2.50 for Somerset county and much of the North Tier counties, particularly from Bradford county west, was some selling at \$3 retail in northern Pennsylvania.

The Ford Truck is reliable and economical

**Dual
Rear Wheels
and Balloon
Tires**
*Interchangeable
all around*

**New
Front Axle
and Spring**
*Unusually
sturdy front
construction*

Larger Brakes

OVER rough roads, through soft ground, up steep hills, the Ford 1½-ton truck carries the load you give it with little effort. Its efficient engine develops 40 horse-power at 2200 r.p.m. The four-speed transmission conveys the power required for handling capacity loads. It also makes greater speed possible when you wish to save time.

Day after day, the Ford truck will work for you without the necessity of frequent adjustments to keep it in repair. It is a strong, burly truck. The new front axle, for example, is twice as strong as formerly. The front spring is heavier, with wider leaves. The front radius-rod is heavier, and king-pins, wheel bearings and thrust bearings are larger.

The front brakes also have been enlarged. They are now the same size as those

in the rear, providing increased braking area and a high degree of safety. The redesigned controls operate with little effort.

A valuable feature of the Ford truck is the new wheel equipment. Dual rear wheels can be installed at small additional cost. Balloon tires of one size are used throughout with the dual equipment, so that all six steel disc wheels and tires are interchangeable all around. Only one spare need be carried.

Both open and closed cabs are available with the standard stake body which is widely used for agricultural purposes. It can be fitted with grain-sides or cattle-racks. Bodies are strongly made, comfortable, and have ample loading space. Go to your Ford dealer's and examine this truck.

Spring comes early on a "Caterpillar" farm

THE farmer who has a "Caterpillar" track-type Tractor starts spring work as soon as frost goes. Soft spots don't worry—nor delay. With plentiful power and positive traction he gets on fields, days—even weeks—sooner.

No miring—those broad tracks ride soft ground just like planks. And "Caterpillar" tracks grip. The "Caterpillar" farmer works his ground on time—to insure well-prepared seedbeds—and make growing seasons long enough to beat fall frosts.

A longer spring—a longer summer to farm more land—to tend crops better. A longer fall—uninterrupted by common delays. That's the gift of "Caterpillar" traction—longer, more profitable working seasons—and farming done quicker and easier.

CATERPILLAR
TRACTOR

AFTER four days of rain Easter Sunday dawned bright and crisp. There was frost here but not hard enough to damage the blossoms. Plums and pears are in full bloom and peaches are half open; this in spite of the fact that we have not had very much warm weather. We had our first mess of asparagus the day before Easter, but several warm days are necessary to bring forth a real cutting.

The following letter from a Chester county woman will no doubt be of interest to others, as several have written me concerning mulch paper:

"Some time ago you spoke of mulch paper and I feel it my duty to give you our experience, hoping it may help others.

"Last year we tried it out well and were more than satisfied. It is a wonderful help, both to conserve moisture and to smother weeds. Between the rows of peas we used the 18-inch paper and had a fine crop with no cultivation whatever. But best of all was the use of paper for sweet potatoes. A strip of the 36-inch paper was placed over each row (ridged). Holes were punched and the plants dropped in, watering in some instances which held the soil close. The plants grew rapidly, the vines spreading over the paper. We had a wonderful crop, mostly the red kind, as we like the red ones best. We have some to this date. The paper was kept in place with small stones and cloths of earth. We set 1,200 plants and gave them no cultivation whatever." Mrs. I. M. B.

The use of mulch paper seems to be getting off to a slow start, yet many of those who have tried it speak well of it. Of course, if it is to become a popular adjunct to the gardener's work it must prove to be cheaper than cultivation for keeping down weeds and providing a mulch.

The letter quoted above again shows the real farmer spirit, the willingness to pass on to others helpful information. In no other business that I know of is there the same generous attitude about telling others what is learned, in other words "giving away trade secrets." A rather narrow-minded, selfish farmer said to me one time that this habit of farmers indicated imbecility; that he never told anybody anything he learned. As might be expected, he was not a popular man in his neighborhood.

I am wondering whether we will continue to see as many rapid changes in the marketing system as we have been seeing. Instead of the producer's community being the field of his market, the world is now everybody's market. Rapid transportation, refrigeration and chain stores have revolutionized the entire business of feeding humanity. But so far, no perfect plan for retaining the full freshness of fruit and vegetables for any considerable time has been devised. The home grower will continue to have the edge on the home market in this respect, for the present at least.

In all probability there will be many home gardens planted this spring. The employment situation is not yet satisfactory, and every one who has a bit of ground will (or should) plant some vegetables. A few square feet of good soil well attended will eke out the contents of a flat pocketbook to a remarkable extent. The trouble with most back-lot gardeners is that the broiling sun of July and August has a most discouraging effect on the average in-door man.

What is started in hope and enthusiasm ends in despair and disaster.

The third generation of the Neshaminy Gardens family is full of pep this spring and is making good use of warmer weather. Several extensive projections have been begun already as the washerwoman can testify.

Friendly Talks

By Edgar L. Vincent

SOMETIMES farmer folks think they know all about shouldering heavy loads and carrying them on to the right ends. Haven't you heard them say something like this: "Who said, 'Bear ye one another's burdens?' must have been thinking of farmers. Aren't we always carrying burdens?"

And yet it very often happens that our ideas of carrying burdens strike a pretty high note. We think of some big thing we are doing, something other folks will remember as long as they live. So our notions on this subject seem to us the greatest and the grandest things we ever do.

But I like to think of old Aunt Pat. She was a little old woman who lived and worked for a neighbor farmer of ours. One of her arms was partly withered, and in intellect she was the humblest of the humble; but how faithfully she did work! The very smallest things of the home fell to her to do, and she did them all so faithfully and so patiently! If ever a woman spent her very life bearing burdens she did. And her reward was so meager, both in money and in friendliness! If ever she does receive any return for her burden-bearing it will have to be in a better world than this.

But will you pardon me if I say that it seems to me Aunt Pat more truly lived out the spirit of burden-bearing than some of the rest of us who are depending on our big things to win us reward? In the truest and best sense of the word when we go down and help some half-sick neighbor to make his garden or to weed out his corn, or get in his hay when a thunderstorm is coming up or any one of a thousand and one common, everyday things, we are bearing our brother's burdens, and may so best be fulfilling the law of the Great Burdenbearer.

Only, we need to live a bit nearer to Him, so that we can catch His spirit and that will help us to see things in their right light.

SOME years ago while traveling across the entire country of Brazil, in size as large as the United States, I saw millions of acres of level, fertile soil still untouched by the plow, acres which can easily be made to grow corn and wheat.

Just recently a news release from that country stated that a National Wheat Conference was called to see what Brazil could do in encouraging the production of wheat in that country, at least in sufficient quantities to feed her 28 millions of people. At the present time most of the bread flour used in that country are imported from the United States and the Argentine.

Land in the great central west of that country is still very cheap. It needs but capital and human direction to bring it into production. Both of these forces are already at work. American farmers will feel their influence before many years have passed.

Surplus Milk or Veal?

By E. A. KIRKPATRICK

IS this the time to use a beef bull in the dairy herd, feed the calves all the milk they can use profitably and sell them for veal?

The very mention of such a thing brings a chorus of "No's" from the pedigree worshippers. When the matter is thrown open for discussion, however, it comes out that some dairymen who milk cows for a living, and give more attention to production than to papers, have been making money right along on what is now suggested as an emergency proposition.

One experiment station in the Middle West has recognized this question as a major one needing an answer, and is starting a research project in an attempt to answer the question which, the station observes, is a problem that has to do with stabilizing the production of milk.

The present situation of low prices for milk and butterfat, and high prices for veal, most likely will not prevail when results of research projects indicate just what should be done. The emergency is now—progressive dairymen, who want to take advantage of whatever there is in the practice of raising veal, want to know now. At least a dozen people have asked me about this in the last week.

My cousin, who is a Vermont Yankee, told me nearly two years ago, when milk prices were good, that he had bought an Angus bull to use on some of his Holstein cows. The first two veal calves, which got all their milk from a cow with a bad udder, brought \$92.50 at the farm. The first year's crop of Angus-Holstein calves sold for veal brought more than the cost of the bull and his keep. He has been raising veal, along with production of milk, ever since. "Because it pays" he explains.

Value of Beef Bull

"But is the beef bull essential in veal production?" you ask. Maybe not always essential, but greatly desirable. W. J. Harris, of the Animal Husbandry Department, Kentucky College of Agriculture, offers this bit of testimony on the subject:

"Veal calves sired by good beef bulls will return more than twice as much as calves out of similar cows that are sired by scrub or dairy bulls. Last year two calves were sold from the Experiment Station herd. This sale illustrates the importance of good breeding. Both were from grade dairy cows, and both were the same age. One had been sired by a pure-bred Angus bull and the other by a grade or scrub. The one by the Angus bull sold for \$31.50 and the other one for \$14.75. It would be conservative to say that a good beef bull will add \$10 to the sale value of each veal calf he sires.

"If dairymen or farmers are trying to breed up a herd of dairy cattle they must use high-class dairy bulls, and of course cannot expect to make much money from the sale of calves. However, if they are interested only in milking cows and selling the calves as veal, it will mean money in their pockets if they breed to a beef bull. The farmer or dairyman should decide which system he will follow and then breed accordingly."

Of course Mr. Harris is a beef cattle man. But it is significant that some of the folks close to the dairy situation see the possibilities of veal profits where milk profits are not. George L. Waugh, extension dairyman of the University of New Hampshire, comes out for veal instead of surplus milk. Inasmuch as Mr. Waugh was an economist before he became a dairy extension expert, his say-so has some weight. He says:

"Since the price of surplus milk has been forced down by the low prices of manufactured dairy

products, many farmers will find it more profitable to use surplus milk for feeding veal calves than to sell as surplus. Whether the surplus is to be put into calves or sent to Boston depends on relative price. As a result of experiments with veal calves at agricultural experiment stations the net value of milk fed to veals may be figured fairly accurately.

"From these experiments it has been concluded that calves which weigh less than 60 pounds at birth offer little chance for profit when milk is selling for \$1.75 a hundredweight. In the trials calves under 60 pounds in weight used an average of 1,000 pounds of milk during the feeding period, requiring a return of 11½ cents a pound for veal to bring a market price equal to the price of surplus milk. Calves which averaged 80 pounds in weight used 700 pounds of milk to attain the 150-pound market weight. On an 11-cent market such calves returned \$2.30 a hundredweight for the milk fed.

"Six to seven weeks is the average time required for feeding veals to get them into market for top prices. Present quotations are about 14 cents for good quality veals."

"How about feeding the beef-dairy calves and selling them for beef?" I have also been asked. Maybe yes, maybe no. Such a plan takes the dairyman into a new field—a field where he isn't so well acquainted. The dairyman knows feeding for milk, but not for beef. Moreover, there is not the opportunity for quick turnover that there is in feeding for veal.

Mind, I do not say there are no profits in such

The high producer used for veal calves had best be milked and calves fed by hand.

a plan. Recently I learned of a dairy farmer in Clark county, South Dakota, who has been milking Holsteins for years. Because he couldn't make anything on the Holstein steers, he put an Angus bull in the herd and produces a carload of the cross-bred steers every year. They sell readily and make a nice profit. They do not compare with beef steers, of course, but far surpass the dairy steer and return a greater profit; in fact, a profit where there was none formerly.

As for the quality of the meat—well, there isn't enough good beef to go around anyway, and the consumer ought to be glad to have some good beef blood in his dairy steer meat. A representative of one of the leading packers told me a year ago: "If it wasn't for dairy cows that are being killed for meat, this country would be starving for beef."

A Saving in Labor

When I visited the Wisconsin Station recently I learned of some work done there with Angus-Holstein steers a year or so ago. In these tests the cross-breds were compared with pure-bred Angus calves and Holstein calves for baby beef—eight steers in each of the three groups.

Of the eight cross-bred carcasses, four were graded choice and four good by a representative of the packing plant where the animals were killed. The pure-breds produced three prime, three choice and two good carcasses; the Holsteins, seven medium and one fair. The cross-breds really made a good showing, the return per steer over cost of feed being \$10.04 excluding hogs, and \$14.13 including pork. The figures for the pure-breds are \$18.84 and \$22.68. The cross-breds brought \$12.50 per cwt. and the pure-breds sold for \$13.25.

The point not to lose sight of in the whole matter, in those herds where none of the calves, or only a few, are raised, is this: Feeding more milk to calves will result in less milk going to market at surplus prices.

If the three-teaters and the low producers that are just a little too good to sell for canners could be used for raising veal calves, there would be more profit on the high milking cows left in the herd producing milk or butterfat for market. A 6,000-pound cow will supply enough milk for two or three calves.

If the veal calves run with the nurse cows, there is also a saving in labor—and labor comes high milking low-producing cows. If the nurse cow is a good milker, milk the cow and feed the calf. But dairymen with such high-producing cows will probably find more profit in milk than in veal. Use the poorest milkers for nurse cows.

A beef bull will put more size and profit into the dairy veals.

COW KILLS WOMAN

SUNDAY evening of last week Mrs. Clarence Settemyer of Cambria county, Pa., was fatally gored by a cow which she had just finished milking. The report of this tragedy, sent us by Mr. P. A. Esch, states that as Mrs. Settemyer turned to leave the barn after milking the angry cow launched an attack with her ten-inch horns. Cries of the victim's six-year-old son brought neighbors, but too late for a rescue. Bulls are not the only killers of their race; a cow with long sharp horns is a beast of uncertain temperament bearing deadly weapons.

TO PREVENT FRAUD

DRASTIC rules to prevent "plugging" of show cattle are announced by the National Dairy Association. Any one found guilty of unnatural practices in fitting animals for show will be permanently barred from exhibiting at the National Dairy Exposition. This action may seem harsh, but it is none too severe for the dishonest practice. The Association should be warmly supported by the great body of conscientious breeders for recognizing and preventing any such trickery, which in the end must harm the pure-bred industry, as well as the individual who would stoop to win by fraud.

PENNSYLVANIA FIRST

LAST year Keystone hens laid 118,429,000 dozen eggs valued at \$43,081,420. This achievement enables Pennsylvania to retain the position as the foremost poultry state, a rank first revealed by the 1925 federal census which showed that our annual egg production exceeded that of any other state by some \$2,000,000. Since that census the value of the annual egg crop has increased almost \$5,000,000. Nearly twice as many eggs are produced in Pennsylvania as twenty years ago. And even now we consume more eggs than we produce in this state. The egg is a small unit, but its aggregate classes as big business.

WOOL FUTURES?

AT various times in the past the matter of future trading in wool has been suggested and dismissed, due usually to the fact that the diversity of wools makes grading difficult and so fails to assure such a market as a working basis. The wool committee of the New York Cotton Exchange again presents a plan for wool futures which it thinks will

PENNSYLVANIA FARMER

May 3, 1930

work. It calls for a contract covering "tops," a form of semi-manufactured wool. Such a market has been successful in Antwerp, while future markets for raw wool have failed in both Antwerp and Le Havre. If the wool trade in this country approves it may be tried here. But judging from the past it is not likely that the wool trade will approve.

HOG FUTURES

LAST week we took a look at the hog futures market at Chicago. Trading has been rather light thus far. The big packers have not participated in it but some small packers are buying. Producers are manifesting more interest than any other class and some have sold the hogs now in their feedlots for later delivery, thus insuring themselves a price and a profit. A sufficient body of speculators to carry the risks which both producers and packers wish to avoid is yet to be developed. Some producers are on the buying side, indicating their confidence in the market and likewise their opinion as to the future supply of hogs in their territory. One of the big benefits of the futures market is yet to be realized. This is the converging of information and opinion as to the future supply, demand and price. There has been no such concentration of information heretofore as this market promises to give us—something highly useful to all concerned in the hog industry.

PROPER PUBLICITY

THE first official information as to the Federal Farm Board's wheat purchases was given last week when Chairman Legge of the Farm Board announced that the Stabilization Corporation owns around 31,000,000 bushels of cash wheat and is long some 19,000,000 bushels of the May future. The figures were about in line with recent trade estimates. The need for publicity concerning the Farm Board's operations was illustrated the same day when an unfounded rumor that the Stabilization Corporation was selling May wheat freely was instrumental in depressing the market around 2½ cents a bushel. The Board will accomplish more toward stabilization by regular public statement of its operations than by keeping them secret, and Mr. Legge is to be commended for the first move in that direction.

MARKET MACHINERY

THAT competent statistician Nat C. Murray shows that farmers get higher prices for grain when trading in futures is heavy than when such trading is light, concluding that "the process of trading in futures is not antagonistic to the interests of farmers." That is a very mild statement, for he can show that this trading is of positive advantage to producers in economy of marketing and distribution. The public is learning the truth about it, for within a few months several producers have commended us for presenting it. One of these men advocates a futures market for potatoes, while another believes that livestock producers will be helped by such a market for hogs.

WHEN CORN IS MARKETING

MUCH of the criticism of the present system of grain marketing is based on the assumption that farmers sell their grain soon after harvest, when the price is low, and that the "speculator" or some other scheming person reaps an undeserved profit by selling the grain later when the price is high. Disregarding the inference that the price is always low immediately after harvest and high later in the crop year, an inference that facts do not support, let us give some figures presented by the Iowa Experiment Station after a survey of the marketing practice of corn

growers in that state. In the eastern-central meat area of the state farmers sell 40 per cent of their corn in the winter half of the year and carry 60 per cent over for summer prices. In the cash grain area corn sales are distributed 50-50 between summer and winter halves of the year. In the western meat area 60 per cent of the cash corn is sold by farmers in the winter half of the year and 40 per cent in the summer half. These percentages do not indicate any rude hurry on the part of corn growers to get rid of their crop regardless of price or future prospects.

A HOG PRODUCTION BASIS

THIS is an age of materialism and arithmetic. We weigh our potatoes and measure our apples; we test our seed and feed our soil. We demand a strict accounting from our cows and our hens and welcome any scheme or device that will enable us to substitute facts for guesswork, eliminate estimates or promote efficiency. The wisdom of such procedure is pretty well recognized. Butterfat tests have helped the dairyman and egg-production records are useful to the poultry breeder. Recent feeding trials have suggested the possibility of applying the production test to hogs. The Department of Agriculture reports that the record of performance test, in which the inherent tendency of a pig to gain is measured, is a "specific method of determining the ability of a brood sow to produce pigs that will make economical gains." A recognized measure of this sort would be of value to the breeder, who might no longer choose his brood sows for beauty of form or disposition, but according to the figures on a chart.

INEVITABLE RESULTS

THE inevitable result of centralized buying is centralized selling. The marketing of milk is a familiar example of this. When mergers of distributors centralized the buying of milk organizations of producers were necessary to centralize selling. Likewise the inevitable result of centralized selling is centralized buying. When Canadian wheat went largely into the hands of one organization which held it for a high price, and when our country's legislation was expected to create a similar condition, British millers and back-yard gardeners who were thinking of experimenting this spring for the first time with mulch planting may be interested in a bulletin on "Paper Mulch for the Vegetable Garden" just issued by the Ohio Experiment Station at Wooster. Last year they compared the growth of spinach, lettuce, cabbage, cauliflower, beets, carrots, rutabagas, peas, green pod beans, wax beans, bush Lima beans, celery, onions, potatoes, sweet corn, cucumbers, sweet peppers and tomatoes in mulched and in cultivated areas. Twenty-eight of the thirty-one crops produced as large or larger total yield from the black paper mulched area as from the cultivated area. In all cases paper mulch gave effective weed control, a thing that appeals to all gardeners.

IN THE WRONG CENTURY

WE have received so many inquiries of such a variety of subjects that we do not believe anything in that line could astonish us. But here is one that does astonish, for it belongs to the Dark Ages rather than to this enlightened century. The inquirer says that one of his neighbors who has inherited a book on witchcraft, brought from an old country long ago, is now practicing the black art in that community. We are asked to give the name of somebody who can "stop that kind of work." We can do it. Anybody who refuses to believe in witchcraft can hog-tie, buck-and-gag and lay in the fence corner any sort of witchcraft or black art, domestic or imported. This answer will not please the inquirer because it is too easy, costs nothing, and is absolutely correct, whereas he wants to pay somebody for something very tedious, spectacular and false.

New Jersey Farm Comment

By G. W. HARRIS

COMMISSION merchants, dealers and brokers buying or negotiating the sale of perishable agricultural products in New Jersey are required by an act passed by the New Jersey Legislature just prior to adjournment to be licensed to do business in the state, together with surety bond of \$3,000 minimum. This act was approved by Governor Larson on April 14 and becomes effective July 1 of this year.

This bill, which was sponsored by the Gloucester County Board of Agriculture through the New Jersey State Federation, proposes to protect New Jersey growers against those buyers with whom growers have had unsatisfactory dealings in the past and insure payment of such moneys as may be due them in the future. This law does not apply to any transaction in which the grower receives payment in full payment of the amount at the time of the transaction or to any transaction involving less than \$25, or to any duly incorporated agricultural cooperative association.

The act defines "commission merchant" to mean any person engaged in the business of receiving any perishable agricultural commodity for sale on commission or in behalf of the grower. The term "dealer" means any person engaged in the business of buying any perishable agricultural commodity from the grower for the purpose of shipping, for sale, for resale or manufacture. A "broker" is defined as any person engaged in the business of negotiating sales of any perishable agricultural commodity on behalf of the grower.

This new law not only affects those growers whose place of business is in New Jersey, but applies to all buyers who come into the state to transact purchases.

Application for license to do business in the state with a bond must be filed with the Secretary of Agriculture in Trenton by June 1. The license fee is \$2 and must be renewed annually. Failure to do this will subject a person to a fine of not less than \$100 nor more than \$500.

The legislature in passing this act intended to provide funds for its enforcement. Greatest financial support will be needed during this first year while the new law is being introduced if it is to be effectively enforced, and the legislative body should have provided ample funds for its enforcement. Doubtless, like nearly all new laws, it may not prove exactly perfect in all details and experience may show the need for some changes.

NEW JERSEY vegetable growers and back-yard gardeners who are thinking of experimenting this spring for the first time with mulch planting may be interested in a bulletin on "Paper Mulch for the Vegetable Garden" just issued by the Ohio Experiment Station at Wooster.

Last year they compared the growth of spinach, lettuce, cabbage, cauliflower, beets, carrots, rutabagas, peas, green pod beans, wax beans, bush Lima beans, celery, onions, potatoes, sweet corn, cucumbers, sweet peppers and tomatoes in mulched and in cultivated areas. Twenty-eight of the thirty-one crops produced as large or larger total yield from the black paper mulched area as from the cultivated area. In all cases paper mulch gave effective weed control, a thing that appeals to all gardeners.

This experience in 1928 with the use of six different types of paper for the growing of thirty-one vegetable crops leads them to recommend it for trial in a limited way until the grower becomes familiar with its usefulness under his growing conditions.

NEW daughters whose production was an 11 per cent increase over the production of their dams at comparable ages is credited to the senior Holstein herd sire, Sir Colantha Barbara Hero, owned by the New Jersey Agricultural College. The yearly average production of his first ten daughters to make yearly official records is 13,500 pounds of milk, while the first five daughters averaged 15,000 pounds of milk.

This sire which is now over eight years of age was secured from the U. S. Government Dairy Farm at Beltsville, Md.

HUNTERDON county poultrymen will not only show birds at the Flemington Fair this year, but they will display carefully selected eggs as well. An egg show has been added to the agricultural exhibit. This will consist of two classes,

one being open to all producers of eggs in Hunterdon county, and the other class will be open to members of boys' and girls' poultry clubs and to vocational agricultural students. These classes will be subdivided into white and brown egg classes with each entry consisting of one dozen eggs.

Egg shows are always of interest to owners of flocks because the small producer has an almost equal opportunity with the large commercial poultrymen in selecting a prize-winning dozen eggs for showing.

LAST week the first two truckloads of strawberries from North Carolina this season arrived in the Dock Street market in Philadelphia. Shipments of perishable fruits and vegetables are taking to the highways and the number of packages carried by truck in many instances nearly equals those shipped in a car by express. The first

A Fellow to Steer Clear of

truck to arrive with strawberries carried 200 crates containing 32 quarts of berries to each case. This is only about 25 crates less than in an express shipment. Prices received were about equal to express shipments, bringing \$7 to \$7.50 per crate for the best, while the trucking charges were less than express rates.

On Thursday of the preceding week two truckloads of asparagus from South Carolina arrived at that market. This is the first truck shipment of perishables recorded in the Philadelphia market from a point of origin so far south. The trip of 675 miles was made in 31 hours and the growers saved 16 to 17 cents per crate of a dozen bunches as compared with express charges. This asparagus seemed to arrive in excellent condition, as it sold at the same price range as express receipts.

THE Maryland Guernsey Association and Eastern Shore breeders have set the date for the annual Guernsey Field Day for the Eastern Shore of Maryland for May 30. This year the show will be held at the Wicomico Fair Grounds near Salisbury where it is expected that over 100 head of cattle from leading herds of nine counties will be shown.

Nearly 1,000 people attended last year's field day at Centerville and a larger attendance is anticipated this year at Salisbury. The day following the show, on May 31, a group of breeders plan to visit several of the leading Guernsey herds on the Shore.

SHIPPING of perishables by truck has replaced a large volume of express business and distant truck shipments at lower than express charges are becoming more and more common. At the present time independent truckers who have built up a large volume of business on the Eastern Shore are

fighting to retain it. The Peninsula Auto Express and Baltimore Transfer Company, claimed to be subsidiaries of the Pennsylvania Railroad, have applied for a franchise to operate an extensive motor freight and express system in that territory and the independent truckers are protesting such action.

LESS than six months remain before the opening of New Jersey's egg-laying contests on next October 1, says John W. Goodman, superintendent, New Jersey egg-laying contests. The pullets to be entered in these competitions should, as a rule, be selected from April or early May hatches. Contest records indicate that the best birds to enter are those coming into production shortly before or shortly after the start of the egg-laying contest year. Pullets that have been producing for a month or so before the contest begins are less desirable because the change to the new environment frequently causes them to quit laying. Late-maturing pullets are likewise undesirable for contest pens because they lose valuable time before beginning to lay.

Heavy breeds take from five and one-half to six months to mature and they should therefore be selected from early to middle of April hatches. The Leghorns, which generally lay at about five months of age, may be selected from late April to early May hatches. There may be some variation from the foregoing, depending on the strain of birds and the management methods.

Pullets entered in egg-laying contests cannot be expected to make good records unless they are given a good start in life and reared under favorable conditions. Frequently, mortality in contest flocks can be traced to ailments of the young stock. Symptoms of coccidiosis, worms and other troubles of adult fowls, as well as a general weakened condition are, as a rule, indications of disease or mismanagement in early life.

Poultrymen who wish to rear healthy pullets capable of laying heavily can do no better than to participate in the "Wage War on Worms and Disease Campaign" which is being conducted by the extension service. The recommendations of this project point the way to growing healthy and vigorous flocks, from which the contest pens may be selected. Poultrymen desirous of rearing their birds in accordance with the recommendations of this campaign should apply to their local county agricultural agents for additional information.

A COW'S diet has a direct influence upon the quantity and quality of the milk she produces. Cows that have been confined all winter and fed dry roughage and dry grain concentrates when turned out on good pasture respond with an increased flow of milk that has a higher nutritive value.

Milk produced on summer pastures is three times as potent in its vitamin C (antiscorbutic) properties as milk from cows fed dry feeds, according to R. G. Connelly, New Jersey associate extension dairyman.

Some of the other nutritive qualities of milk also are improved when cows are turned out on fresh pasture. The young grasses are succulent in nature and rich in highly digestible proteins, minerals and vitamins. These stimulate production, improve the mineral as well as the vitamin content of the milk and otherwise impart to it nourishing and health building qualities.

"THE potato grower who does not spray this year is taking a chance which he can ill afford."

This is the warning of Dr. W. H. Martin, plant pathologist for the New Jersey Agricultural Experiment Station, who points out that the acreage of potatoes in southern states is "well in excess of last year."

"In view of this situation," Mr. Martin says, "we must obtain maximum yields to the acre this season. The thorough spraying with Bordeaux mixture is one of the greatest aids to producing bumper crops of potatoes. The first application should be made when the plants are 4 to 6 inches high, and subsequent applications should follow at 7-day to 10-day intervals. Apply the spray at the rate of at least 100 gallons to the acre, and adjust the nozzles to cover thoroughly each plant with a film of spray material."

This farmer finds one of the newer outfits a time and trouble saver in cultivating checked corn.

PROMISES of "\$3 for \$1" is not an advertisement for some kind of a security-selling scheme; it is a claim made on the basis of the experiences and observations of 2,053 corn growers in Pennsylvania, Maryland, New Jersey, Delaware and West Virginia.

The use of fertilizer increases corn yields on an average of 12.8 bushels per acre as judged by the yield estimates of more than 1,000 corn growers in Pennsylvania. The average increases expected in the other states are: Maryland, 11.9 bushels; Delaware, 11.8 bushels; New Jersey, 26.2 bushels; and West Virginia, 17.7 bushels. These data were obtained in a survey made by The National Fertilizer Association in which 5,796 farmers in these five states were personally interviewed regarding their experiences and observations in the use of commercial fertilizer. Of this number, 4,995 gave corn as one of their crops.

The average estimated increases of from 11.8 to 26.2 bushels amount to gains of from 30 per cent in Delaware, to 70 per cent in New Jersey, over the yields expected by those same growers without fertilizer. At average corn prices, each dollar invested in fertilizer, according to these farmers, returns yield increases worth approximately \$3.50 in Pennsylvania, \$2.50 in Delaware, \$2.25 in Maryland, \$5.50 in West Virginia and \$3.25 in New Jersey.

In growing corn, the yield, while very important, is not all. What about quality? One of the questions asked in this survey was, "Have you noticed any effects of fertilizer on the market quality and feeding quality of your crops?" While this question was asked for crops in general, the answers given can be said to apply as fully to corn as to wheat and other fertilized crops in this region. More than 4,100 of those interviewed stated they had observed that fertilizer improves market quality; nearly 3,500 stated that fertilizer also improves the feeding quality of crops.

How Quality Counts

Improvement in quality affects the value of the entire yield of a crop, and not merely the increased bushels. For example, a yield of 35 bushels of 80-cent corn is worth \$28; a yield of 50 bushels of 85-cent corn (allowing five cents per bushel for better quality) is worth \$42.50, or \$14.50 more than the corn of lower yield and market quality. Of this amount, \$2.50 may be credited to improved quality.

Closely associated with yield and quality of crops is the matter of time of maturity. With corn and

Food for the Corn Crop

By H. W. WARNER

other late-harvested crops, early and even ripening is very much to be desired. That fertilizer hastens maturity is rather generally accepted but additional evidence is always in order. Nearly 4,800 of the 5,796 farmers who answered this question reported that fertilizer hastens crop maturity. The value of this effect alone in seasons like 1924 and 1927 may be worth much more than the cost of the fertilizer.

A quick start of the young corn plant helps in several ways. It makes it possible to cultivate a few days sooner than might otherwise be done and thus get ahead of the weeds; it is especially valuable in cold, backward seasons and for late-planted fields. According to the hundreds of farmers who answered the question, commercial fertilizer gives crops this much-desired quick start. In fact, 5,211 of the 5,796 farmers interviewed—nearly 90 per cent—stated they had observed this effect.

A point deserving special mention is that 2,316 farmers reported having observed that fertilizer increases crop resistance to disease, bushels, in West Virginia.

In Pennsylvania, about 60 per cent of the corn acreage now receives commercial fertilizer; in New Jersey, about 70 per cent is fertilized. In Delaware, Maryland and West Virginia much less than half of the corn acreage is so treated. The experiences of farmers, the records of farm tests and results from official experiments show for practically all eastern soils that additional plant food will pay.

Machinery Plays Its Part

MODERN machinery not only makes possible more rapid handling of operations common a few years ago, but also permits adoption of methods not heretofore practical or possible. In the East where corn ground is nearly always plowed

before planting, farmers find two, three and four row tractor plows a great aid in taking advantage of a few good days of plowing weather. Although the tractor is a relatively new machine we have heard of it for four or five years. It is now being used by many farmers who prepare sandy or friable soil with the one-disk, and by using disk-barrow or field cultivator before planting are able to secure good results.

A great many acres of corn will be planted by tractor planters this spring. Use of the rotary hoe is becoming more common, as farmers have found that using it they can keep practically weeds out of the row. Indications certainly point to change in planting lists in the West. Two, three and four-row lists are going to make history for those men who use them. Where the ground has been worked before, all-purpose tractors can pull the two and three-row outfits more easily, and planting will be speeded up.

A program which has been followed by several farmers in Illinois and Iowa may bring out new ideas although it is not one which would necessarily suit all conditions. The corn is harrowed several days after planting, just as soon as a few small weeds have started. This smooths out the planter tracks and also serves as a cultivation. Some men have used a device which attaches to the planter and ridge out over the row. This prevents washing in of rain, and the initial harrowing can be deferred a few days longer.

Use of Harrow

The corn is harrowed several days after planting, just as soon as a few small weeds have started. This smooths out the planter tracks and also serves as a cultivation. Some men have used a device which attaches to the planter and ridge out over the row. This prevents washing in of rain, and the initial harrowing can be deferred a few days longer.

Then the rotary hoe is used either once or twice before the corn is six or eight inches high. The number of weeds, soil and weather conditions, amount of acreage would determine whether the hoe was used twice, or only once.

Using the cultivator after the initial hoeing favored by a number of men. They can make good time as the corn is then sufficiently large to get out of danger from covering. Of course, the number of acres one man can handle has been largely by use of three and four-row cultivators.

One farmer suggests that a small ridge be kept along each side of the corn rows. Then when the rotary hoe is used it will tear into this soft ridge and destroy seedling weeds which have started. The corn will be about twelve inches high when it is gone over the second time with the hoe. If procedure we have been discussing is followed.

The next cultivation will have to be with the shovel cultivator and will probably be the last. Tudor Charles Jr.

Results of "no treatment." Both pictures were taken in Bradford county, Pa., where fertilizer tests were made by the state Experiment Station.

This corn field shows the effect of lime and a complete fertilizer.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Rice, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they have based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the valley hoping that something will happen to create business for the sawmill they have built. The son and daughter arrive following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it becomes evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness and mountains that stretched between them and the Pacific Coast.

might have been the part of wisdom, but they did not do it, and Barty followed on after them that day, begging as often as he caught up.

A thunder storm occurred during the afternoon and they camped early in order to dry their clothes and their outfit. The place chosen was beside several large rocks close on the river; and by Milly's advice, Winthrop cut a number of large poplar poles and fenced in the rearward portion of their camp, to keep Barty outside it. While Milly prepared their evening meal, Woodbridge, senior, led out the horse and the Jersey to graze at open places along the river bank and Winthrop fished with some little success in a pool at the foot of a rapid turn of the stream just above their camp.

Later they tied up Bright-eyes and the old horse inside the fence to prevent Barty from annoying them. Throughout the evening, however, the latter stood by the fence and begged, his extensive appetite not much appeased by the fish Winthrop tossed to him. The kind of fish they took from the river here were not trout, but wall-eyed pike, some of which were of five pounds weight.

The night passed without incident; and after this manner they went on for four or five days, following the Peace through hilly country, much of it

lowing the Peace through hilly country, much of it it broke where fires had formerly burned the forest. Far to the west they could see high mountains, some of the peaks capped with snow. The thought that these would have to be passed filled the elder Woodbridge with a dread that was well-nigh despair. His was far from being the courage of Hannibal. "Beyond those summits of great pain" there lay no "Italy" for him.

Every night they chose a place for camping that could easily be fenced about to protect their stock and tent—a wise precaution on Milly's part, although Winthrop sometimes grumbled over the extra labor with the ax. Barty still followed them, greedily bolting whatever they had to throw to him. One night an elk, or else a moose, came trotting rapidly along the path by the river and actually stepped astride their fence before it perceived the horse and the tent. Suddenly aware of something unusual, it bounded away with a loud, shrill snort.

On another night, the eleventh, I think, after leaving Hudson's Hope, they were awakened by loud, angry growls from Barty. The dim "old" moon now gave but little light; yet as nearly as they could make out, another bear had approached, attracted, perhaps, by the odor of fish. Barty appeared to resent the presence of his congener. The growling on both sides was terrific. Winthrop took his gun to interfere, but while he was trying to catch sight of the obstreperous newcomer, both bears went off at a great pace. Barty was chasing the interloper, they thought, though how he managed to do so was not easily understood. Away they went, however, crashing through underbrush till they appeared to be fully a mile away, when an even louder uproar ensued for some time. The outcries indicated that more than two bears were now involved in the melee. The silent, dim wilderness resounded to the uproar. Prehistoric dinosaurs in savage conflict could hardly have raised a more awesome rumpus. Yells as of extreme pain presently succeeded to the growls and roars of ferocity, and ere long the combatants appeared—from the sounds—to be racing off to a greater and greater distance, till finally the noise of their contention died away in the far forest.

Milly and Winthrop had stood listening with mingled feelings of solicitude and alarm. "Do you suppose poor Barty will ever come back?" the former exclaimed. "Oh, he will be back, if they haven't killed him," Winthrop replied. "Nothing less will keep him away from us."

But Barty had not returned when they went on next morning. "I'm afraid those other bears have mauled and mangled him till he has crawled away somewhere to languish and die," Milly said ruefully.

"More likely he is merely lying up to recuperate," was Winthrop's opinion. "I wager we shall see him again within two days, hungry as ever."

"I SUPPOSE it is useless to try to look him up," Milly remarked a little later, as they took their way along the trail to the westward. She, too, believed that Barty would probably overtake them. In point of fact, however, they never saw him again; and Freeman Woodbridge considered this a very good riddance from a troublesome camp-follower.

As they continued on toward the mountains of the central range of the Rockies, the hills encroached more upon the river valley, rendering the trail along the north bank difficult to follow. At times they were near losing it altogether in the thick spruce woods, and were delayed picking it up. Often there were windfalls across it which Winthrop had to cut away before the old horse and Bright-eyes could go on. Some days they made no more than three or four miles. In short they had far greater difficulties of this kind than we have space to recount; but there was no danger of becoming lost as long as they kept within sight or hearing of the river.

Two days after the unquiet night when Barty disappeared, they met wayfarers on the trail in the form of four Indians, probably of the Beaver tribe. Winthrop was ahead at the time, cutting away a windfall, when hearing a low exclamation, he looked around and saw a squaw with a gun and a pack a few steps away, regarding him with a startled expression. Behind her came another squaw bent half double in the path, carrying on her back the only man of the party, who appeared to be taking matters easy. In the rear came still another squaw heavily loaded with their entire outfit, including a brown, sharp-eyed infant that peered fearfully over her shoulder.

(To be continued.)

The Cheerful Plowman

TROUBLES THAT NEVER COME

WHEN I am out with Nig at night I find the season's full of fright. He shies, and starts, and snorts, he enters to the right and left, of common sense he is bereft; he jumps, and jerks, and starts.

"What is the rip with you?" I say, "You're safe as in the light of day, there are no dangers there. That whited thing is but a birch, so why throw up your head and lurch, a shame upon your scare! Hucks, that dim sound is but the wind, you act like one whose heart had sinned against the very fates, there are no dangers in the trees, or in the cool nocturnal breeze, no murder in the gates. Cut out the monkey shins, old top, cut out the nervous skip and hop, and be a horse of grit. Why act the baby in the night, you who by day are brave and bright, be calm and use your wit."

Yes, thus I lecture skittish Nig in phrases round, and strong, and big, in moral tones and clear; I lecture him like one, by gee, who never had a trembling knee, like one who knew no fear. But listen, just a while ago I faced six notes all in a row, all coming due at once, and sixteen pigs all died that day, while three fat gobbles ran away and left me only runts. The bank in which I had six hucks broke up like brittle peanut shucks, and hail fell in my oats, the mumps appeared among my geese, cried I, "Will terrors never cease? How can I meet those notes?"

"The night is dark," I cried, "ah, the gobbles will not let me pines, they have me by the neck; the spooks are dancing on my chest, they give me neither peace nor rest. I am a total wreck! What next? Ah, look! The sheriff comes right through the night to grab my thumbs and lead me off to jail. I am afraid, where shall I turn, my very eyelids smart and burn, I fear the dark. I fail!"

How silly! Daylight came again, I held my place among the men, I had no spooks in fear. So, dear Old Nig, forget the ghosts, they are but trees, they are but posts; you're far too much like me, J. E. T.

COW KILLS WOMAN

SUNDAY evening of last week Mrs. Clarence Settemyer of Cambria county, Pa., was fatally gored by a cow which she had just finished milking. The report of this tragedy, sent us by Mr. P. A. E. Ech, states that as Mrs. Settemyer turned to leave the barn after milking the angry cow launched an attack with her ten-inch horns. Cries of the victim's six-year-old son brought neighbors, but too late for a rescue. Bulls are not the only killers of their race; a cow with long sharp horns is a beast of uncertain temperament bearing deadly weapons.

TO PREVENT FRAUD

DRASTIC rules to prevent "plugging" of show cattle are announced by the National Dairy Association. Any one found guilty of unnatural practices in fitting animals for show will be permanently barred from exhibiting at the National Dairy Exposition. This action may seem harsh, but it is none too severe for the dishonest practice. The Association should be warmly supported by the great body of conscientious breeders for recognizing and preventing any such trickery, which in the end must harm the pure-bred industry, as well as the individual who would stoop to win by fraud.

PENNSYLVANIA FIRST

LAST year Keystone hens laid 118,429,000 dozen eggs valued at \$43,081,420. This achievement enables Pennsylvania to retain the position as the foremost poultry state, a rank first revealed by the 1925 federal census which showed that our annual egg production exceeded that of any other state by some \$2,000,000. Since that census the value of the annual egg crop has increased almost \$5,000,000. Nearly twice as many eggs are produced in Pennsylvania as twenty years ago. And even now we consume more eggs than we produce in this state. The egg is a small unit, but its aggregate classes as big business.

WOOL FUTURES?

AT various times in the past the matter of future trading in wool has been suggested and dismissed, due usually to the fact that the diversity of wools makes grading difficult and so fails to assure such a market a working basis. The wool committee of the New York Cotton Exchange again presents a plan for wool futures which it thinks will

PENNSYLVANIA FARMER

May 3, 1930

work. It calls for a contract covering "tops," a form of semi-manufactured wool. Such a market has been successful in Antwerp, while untimely markets for raw wool have failed in both Antwerp and Le Havre. If the wool trade in this country approves it may be tried here. But judging from the past it is not likely that the wool trade will approve.

HOG FUTURES

LAST week we took a look at the hog futures market at Chicago. Trading has been rather light thus far. The big packers have not participated in it but some small packers are buying. Producers are manifesting more interest than any other class and some have sold the hogs now in their feedlots for later delivery, thus insuring themselves a price and a profit. A sufficient body of speculators to carry the risks which both producers and packers wish to avoid is yet to be developed. Some producers are on the buying side, indicating their confidence in the market and likewise their opinion as to the future supply of hogs in their territory. One of the big benefits of the futures market is yet to be realized. This is the converging of information and opinion as to the future supply, demand and price. There has been no such concentration of information heretofore as this market promises to give us—something highly useful to all concerned in the hog industry.

PROPER PUBLICITY

THE first official information as to the Federal Farm Board's wheat purchases was given last week when Chairman Legge of the Farm Board announced that the Stabilization Corporation owns around 31,000,000 bushels of cash wheat and is long some 19,000,000 bushels of the May future. The figures were about in line with recent trade estimates. The need for publicity concerning the Farm Board's operations was illustrated the same day when an unfounded rumor that the Stabilization Corporation was selling May wheat freely was instrumental in depressing the market around 2½ cents a bushel. The Board will accomplish more toward stabilization by regular public statement of its operations than by keeping them secret, and Mr. Legge is to be commended for the first move in that direction.

MARKET MACHINERY

THAT competent statistician Nat C. Murray shows that farmers get higher prices for grain when trading in futures is heavy than when such trading is light, concluding that "the process of trading in futures is not antagonistic to the interests of farmers." That is a very mild statement, for he can show that this trading is of positive advantage to producers in economy of marketing and distribution. The public is learning the truth about it, for within a few months several producers have commended us for presenting it. One of these men advocates a futures market for potatoes, while another believes that livestock producers will be helped by such a market for hogs.

WHEN CORN IS MARKETED

MUCH of the criticism of the present system of grain marketing is based on the assumption that farmers sell their grain soon after harvest, when the price is low, and that the "speculator" or some other scheming person reaps an undeserved profit by selling the grain later when the price is high. Disregarding the inference that the price is always low immediately after harvest and high later in the crop year, an inference that facts do not support, let us give some figures presented by the Iowa Experiment Station after a survey of the marketing practice of corn

growers in that state. In the eastern-central meat area of the state farmers sell 40 per cent of their corn in the winter half of the year and carry 60 per cent over for summer prices. In the cash grain area corn sales are distributed 50-50 between summer and winter halves of the year. In the western meat area 60 per cent of the cash corn is sold by farmers in the winter half of the year and 40 per cent in the summer half. These percentages do not indicate any rude hurry on the part of corn growers to get rid of their crop regardless of price or future prospects.

A HOG PRODUCTION BASIS

THIS is an age of materialism and arithmetic. We weigh our potatoes and measure our apples; we test our seed and feed our soil. We demand a strict accounting from our cows and our hens and welcome any scheme or device that will enable us to substitute facts for guesswork, eliminate estimates or promote efficiency. The wisdom of such procedure is pretty well recognized. Butterfat tests have helped the dairyman and egg-production records are useful to the poultry breeder. Recent feeding trials have suggested the possibility of applying the production test to hogs. The Department of Agriculture reports that the record of performance test, in which the inherent tendency of a pig to gain is measured, is a "specific method of determining the ability of a brood sow to produce pigs that will make economical gains." A recognized measure of the sort would be of value to the breeder, who might no longer choose his brood sows in beauty of form or disposition, but according to the figures on a chart.

INEVITABLE RESULTS

THE inevitable result of centralized buying is centralized selling. The marketing of milk is a familiar example of this. When mergers of distributors centralized the buying of milk organizations of producers were necessary to centralize selling. Likewise the inevitable result of centralized selling is centralized buying. When Canadian wheat went largely into the hands of one organization which held it for a high price, and when our country's legislation was expected to create a similar condition, British millers interests resorted to centralized buying. Now there is a movement in Britain to centralize wheat buying still further under a government agency. Centralization may be the most economical way in either buying or selling, and if so it will survive by virtue of that fact, but let us not expect that it will yield greater and permanent advantages by means of price control or "bargaining power," for in due time one centralization will always be met and matched by another.

IN THE WRONG CENTURY

WE have received so many inquiries of such a variety of subjects that we do not believe anything in that line could astonish us. But here is one that does astonish. It belongs to the Dark Ages rather than to this enlightened century. The inquirer states that one of his neighbors who has inherited a book on witchcraft, brought from an old country long ago, is now practicing the black art in that community. We are asked to give the name of somebody who can "stop the kind of work." We can do it. Anybody who refuses to believe in witchcraft can hog-buck-and-gag and lay in the fence corner sort of witchcraft or black art, domestic imported. This answer will not please the inquirer because it is too easy, costs nothing and is absolutely correct, whereas he wants to pay somebody for something mysterious, spectacular and false.

New Jersey Farm Comment

By G. W. HARRIS

COMMISSION merchants, dealers and brokers buying or negotiating the sale of perishable agricultural products in New Jersey are required by an act passed by the New Jersey Legislature just prior to adjournment to be licensed as business in the state, together with surety bond of \$500 minimum. This act was approved by Governor Larson on April 14 and becomes effective July 1 of this year.

This bill, which was sponsored by the Gloucester County Board of Agriculture through the New Jersey State Federation, proposes to protect New Jersey growers against those buyers with whom they have had unsatisfactory dealings in the past and insure payment of such moneys as may be due them in the future. This law does not apply any transaction in which the grower receives cash in full payment of the amount at the time the transaction or to any transaction involving more than \$25, or to any duly incorporated agricultural cooperative association.

The act defines "commission merchant" to mean any person engaged in the business of receiving or disposing of perishable agricultural commodity for sale on commission or in behalf of the grower. The term "dealer" means any person engaged in the business of buying any perishable agricultural commodity from the grower for the purpose of shipping, for sale, for resale or manufacture. A "broker" is defined as any person engaged in the business of negotiating sales of any perishable agricultural commodity on behalf of the grower.

This new law not only affects those persons whose place of business is in New Jersey, but applies to all buyers who come into the state to transact purchases.

Application for license to do business in the state with a bond must be filed with the Secretary of Agriculture in Trenton by June 1. The license fee is \$2 and must be renewed annually. Failure to do this will subject a person to a fine of not less than \$10 nor more than \$500.

The legislature in passing this act intended to provide funds for its enforcement. Greatest financial support will be needed during this first year while the new law is being introduced if it is to be effectively enforced, and the legislative body should have provided ample funds for its enforcement. Doubtless, like nearly all new laws, it may not prove exactly perfect in details and experience may show need for some changes.

NEW JERSEY vegetable growers and back-yard gardeners who are thinking of experimenting this year for the first time with mulching may be interested in a bulletin on "Paper Mulch for the Vegetable Garden" just issued by the Ohio Experiment Station at Wooster.

Last year they compared the growth of spinach, lettuce, cabbage, cauliflower, beets, carrots, rutabagas, peas, green pod beans, wax beans, bush Lima beans, celery, onions, potatoes, sweet corn, cucumbers, sweet peppers and tomatoes in mulched and in cultivated areas. Twenty-five of the thirty-one crops produced as large or larger total yield from the black paper mulched areas as from the cultivated area. In all cases paper mulch gave effective weed control, a thing that is a boon to all gardeners.

This experience in 1928 with the use of six different types of paper for the growing of thirty-one vegetable crops leads them to recommend it for use in a limited way until the grower becomes familiar with its usefulness under his growing conditions.

NEW daughters whose production was an 11 per cent increase over the production of the senior sire, Sir Colantha Barbara Hero, bred by the New Jersey Agricultural College, the yearly average production of his first ten daughters to make yearly official records is 13,500 pounds of milk, while the first five daughters averaged 15,000 pounds of milk.

This sire which is now over eight years of age was secured from the U. S. Government Dairy Farm at Beltsville, Md.

one being open to all producers of eggs in Hunterdon county, and the other class will be open to members of boys' and girls' poultry clubs and to vocational agricultural students. These classes will be subdivided into white and brown egg classes with each entry consisting of one dozen eggs.

Egg shows are always of interest to owners of flocks because the small producer has an almost equal opportunity with the large commercial poultrymen in selecting a prize-winning dozen eggs for showing.

LAST week the first two truckloads of strawberries from North Carolina this season arrived in the Dock Street market in Philadelphia. Shipments of perishable fruits and vegetables are taking to the highways and the number of packages carried by truck in many instances nearly equals those shipped in a car by express. The first

A Fellow to Steer Clear of

truck to arrive with strawberries carried 200 crates containing 32 quarts of berries to each case. This is only about 25 cents less than in an express shipment. Prices received were about equal to express shipments, bringing \$7 to \$7.50 per crate for the best, while the trucking charges were less than express rates.

On Thursday of the preceding week two truckloads of asparagus from South Carolina arrived at that market. This is the first truck shipment of perishables recorded in the Philadelphia market from a point of origin so far south. The trip of 675 miles was made in 31 hours and the growers saved 16 to 17 cents per crate of a dozen bunches as compared with express charges. This asparagus seemed to arrive in excellent condition, as it sold at the same price range as express receipts.

THE Maryland Guernsey Association and Eastern Shore breeders have set the date for the annual Guernsey Field Day for the Eastern Shore of Maryland for May 30. This year the show will be held at the Wicomico Fair Grounds near Salisbury where it is expected that over 100 head of cattle from leading herds of nine counties will be shown.

Nearly 1,000 people attended last year's field day at Centerville and a larger attendance is anticipated this year at Salisbury. The day following the show, on May 31, a group of breeders plan to visit several of the leading Guernsey herds on the Shore.

SHIPPING of perishables by truck has replaced a large volume of express business and distant truck shipments at lower than express charges are becoming more and more common. At the present time independent truckers who have built up a large volume of business on the Eastern Shore are

fighting to retain it. The Peninsula Auto Express and Baltimore Transfer Company, claimed to be subsidiaries of the Pennsylvania Railroad, have applied for a franchise to operate an extensive motor freight and express system in that territory and the independent truckers are protesting such action.

LESS than six months remain before the opening of New Jersey's egg-laying contests on next October 1, says John W. Goodman, superintendent, New Jersey egg-laying contests. The pullets to be entered in these competitions should, as a rule, be selected from April or early May hatches. Contest records indicate that the best birds to enter are those coming into production shortly before or shortly after the start of the egg-laying contest year. Pullets that have been producing for a month or so before the contest begins are less desirable because the change to the new environment frequently causes them to quit laying. Late-maturing pullets are likewise undesirable for contest pens because they lose valuable time before beginning to lay.

Heavy breeds take from five and one-half to six months to mature and they should therefore be selected from early to middle of April hatches. The Leghorns, which generally lay at about five months of age, may be selected from late April to early May hatches. There may be some variation from the foregoing, depending on the strain of birds and the management methods.

Pullets entered in egg-laying contests cannot be expected to make good records unless they are given a good start in life and reared under favorable conditions. Frequently, mortality in contest flocks can be traced to ailments of the young stock. Symptoms of coccidiosis, worms and other troubles of adult fowls, as well as a general weakened condition are, as a rule, indications of disease or mismanagement in early life.

Poultrymen who wish to rear healthy pullets capable of laying heavily can do no better than to participate in the "Wage War on Worms and Disease Campaign" which is being conducted by the extension service. The recommendations of this project point the way to growing healthy and vigorous flocks, from which the contest pens may be selected. Poultrymen desirous of rearing their birds in accordance with the recommendations of this campaign should apply to their local county agricultural agents for additional information.

A COW's diet has a direct influence upon the quantity and quality of the milk she produces. Cows that have been confined all winter and fed dry roughage and dry grain concentrates when turned out on good pasture respond with an increased flow of milk that has a higher nutritive value.

Milk produced on summer pastures is three times as potent in its vitamin C (ascorbic acid) properties as milk from cows fed dry feeds, according to R. G. Connelly, New Jersey associate extension dairyman.

Some of the other nutritive qualities of milk also are improved when cows are turned out on fresh pasture. The young grasses are succulent in nature and rich in highly digestible proteins, minerals and vitamins. These stimulate production, improve the mineral as well as the vitamin content of the milk and otherwise impart to it nourishing and health building qualities.

THE potato grower who does not spray this year is taking a chance which he can ill afford.

This is the warning of Dr. W. H. Martin, plant pathologist for the New Jersey Agricultural Experiment Station, who points out that the acreage of potatoes in southern states is "well in excess of last year."

"In view of this situation," Mr. Martin says, "we must obtain maximum yields to the acre this season. The thorough spraying with Bordeaux mixture is one of the greatest aids to producing bumper crops of potatoes. The first application should be made when the plants are 4 to 6 inches high, and subsequent applications should follow at 7-day to 10-day intervals. Apply the spray at the rate of at least 100 gallons to the acre, and adjust the nozzles to cover thoroughly each plant with a film of spray material."

This farmer finds one of the newer outfits a time and trouble saver in cultivating checked corn.

PROMISES of "\$3 for \$1" is not an advertisement for some kind of a security-selling scheme; it is a claim made on the basis of the experiences and observations of 2,053 corn growers in Pennsylvania, Maryland, New Jersey, Delaware and West Virginia.

The use of fertilizer increases corn yields on an average of 12.8 bushels per acre as judged by the yield estimates of more than 1,000 corn growers in Pennsylvania. The average increases expected in the other states are: Maryland, 11.9 bushels; Delaware, 11.8 bushels; New Jersey, 26.2 bushels, and West Virginia, 17.7 bushels. These data were obtained in a survey made by The National Fertilizer Association in which 5,796 farmers in these five states were personally interviewed regarding their experiences and observations in the use of commercial fertilizer. Of this number, 4,995 gave corn as one of their crops.

The average estimated increases of from 11.8 to 26.2 bushels amount to gains of from 30 per cent in Delaware, to 70 per cent in New Jersey, over the yields expected by those same growers without fertilizer. At average corn prices, each dollar invested in fertilizer, according to these farmers, returns yield increases worth approximately \$3.50 in Pennsylvania, \$2.50 in Delaware, \$2.25 in Maryland, \$5.50 in West Virginia and \$3.25 in New Jersey.

In growing corn, the yield, while very important, is not all. What about quality? One of the questions asked in this survey was, "Have you noticed any effects of fertilizer on the market quality and feeding quality of your crops?" While this question was asked for crops in general, the answers given can be said to apply as fully to corn as to wheat and other fertilized crops in this region. More than 4,100 of those interviewed stated they had observed that fertilizer improves market quality; nearly 3,500 stated that fertilizer also improves the feeding quality of crops.

How Quality Counts

Improvement in quality affects the value of the entire yield of a crop, and not merely the increased bushels. For example, a yield of 35 bushels of 86-cent corn is worth \$28; a yield of 50 bushels of 85-cent corn (allowing five cents per bushel for better quality) is worth \$42.50, or \$14.50 more than the corn of lower yield and market quality. Of this amount, \$2.50 may be credited to improved quality.

Closely associated with yield and quality of crops is the matter of time of maturity. With corn and

Food for the Corn Crop

By H. W. WARNER

other late-harvested crops, early and even ripening is very much to be desired. That fertilizer hastens maturity is rather generally accepted but additional evidence is always in order. Nearly 4,800 of the 5,796 farmers who answered this question reported that fertilizer hastens crop maturity. The value of this effect alone in seasons like 1924 and 1927 may be worth much more than the cost of the fertilizer.

A quick start of the young corn plant helps in several ways. It makes it possible to cultivate a few days sooner than might otherwise be done and thus get ahead of the weeds; it is especially valuable in cold, backward seasons and for late-planted fields. According to the hundreds of farmers who answered the question, commercial fertilizer gives crops this much-desired quick start. In fact, 5,211 of the 5,796 farmers interviewed—nearly 90 per cent—stated they had observed this effect.

A point deserving special mention is that 2,316 farmers reported having observed that fertilizer increases crop resistance to disease. In Pennsylvania, about 60 per cent of the corn acreage now receives commercial fertilizer; in New Jersey, about 70 per cent is fertilized. In Delaware, Maryland and West Virginia much less than half of the corn acreage is so treated. The experiences of farmers, the records of farm tests and results from official experiments show for practically all eastern soils that additional plant food will pay.

Machinery Plays Its Part

MODERN machinery not only makes possible more rapid handling of operations common a few years ago, but also permits adoption of methods not heretofore practical or possible. In the East where corn ground is nearly always plowed

before planting, farmers find two, three and four-row bottom tractor plows of great aid in taking advantage of a few extra days of plowing weather. Although the plow is a relatively new machine, we have heard of several farmers who have plowed sandy or firm soil with the one-disk, and by using disk-harrow or field cultivator before planting are able to secure good results.

A great many acres of corn will be planted by tractor planters this spring. The rotary hoe is becoming more common, as farmers have found that using it they can keep practically weeds out of the row. Indications certainly point to the use of the rotary hoe in planting listed corn in the West. The rotary hoe is becoming more common, as farmers have found that using it they can keep practically weeds out of the row.

Indications certainly point to the use of the rotary hoe in planting listed corn in the West. The rotary hoe is becoming more common, as farmers have found that using it they can keep practically weeds out of the row. Indications certainly point to the use of the rotary hoe in planting listed corn in the West.

Two, three and four-row listers are going to have a history for those men who use them. Where ground has been worked before, all-purpose listers can pull the two and three-row outfits easily, and planting will be speeded up.

A program which has been followed by several farmers in Illinois and Iowa may bring out new ideas although it is not one which will necessarily suit all conditions.

Use of Harrow

The corn is harrowed several days after plowing, just as soon as a few small weeds have appeared. This smooths out the planter tracks and serves as a cultivation. Some men have used a device which attaches to the planter and harrows the dirt over the row. This prevents washing in of rain, and the initial harrowing can be deferred a few days longer.

Then the rotary hoe is used either once or twice before the corn is six or eight inches high. The number of weeds, soil and weather conditions, amount of acreage would determine whether the hoe was used twice, or only once.

Using the cultivator after the initial hoeing is favored by a number of men. They can make the corn as the corn is then sufficiently large to get out of danger from covering. Of course, the number of acres one man can handle has been largely by use of three and four-row cultivators.

One farmer suggests that a small ridge be run along each side of the corn rows. Then when the rotary hoe is used it will tear into this soft soil and destroy seedling weeds which have started. The corn will be about twelve inches high when it is gone over the second time with the hoe, if the procedure we have been discussing is followed.

The next cultivation will have to be with the shovel cultivator and will probably be the last. Tudor Charles

Results of "no treatment." Both pictures were taken in Bradford county, Pa., where fertilizer tests were made by the state Experiment Station.

This corn field shows the effect of lime and a complete fertilizer.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Stocum, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the vain hope that something will happen to create business for the sawmill they have built. The son and daughter advise following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it became evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness, and mountains that stretched between them and the Pacific Coast.

might have been the part of wisdom, but they did not do it, and Barty followed on after them that day, begging as often as he caught up.

A thunder storm occurred during the afternoon and they camped early in order to dry their clothes and their outfit. The place chosen was beside several large rocks close to the river; and by Milly's advice, Winthrop cut a number of large poplar poles and fenced in the rearward portion of their camp, to keep Barty outside it. While Milly prepared their evening meal, Woodbridge, senior, led out the horse and the Jersey to graze at open places along the river bank and Winthrop fished with some little success in a pool at the foot of a rapid turn of the stream just above their camp.

Later they tied up Bright-eyes and the old horse inside the fence to prevent Barty from annoying them. Throughout the evening, however, the latter stood by the fence and begged, his extensive appetite not much appeased by the fish Winthrop tossed to him. The kind of fish they took from the river here were not trout, but wall-eyed pike, some of which were of five pounds weight.

The night passed without incident; and after this manner they went on for four or five days, fol-

The Cheerful Plowman

TROUBLES THAT NEVER COME

WHEN I am out with Nig at night I find the rascal's full of fright. He shies, and starts, and snorts, he catters to the right and left, of common sense he is bereft; he jumps, and jerks, and sports.

"What is the rip with you?" I say, "You're safe as in the light of day, there are no dangers there. That whited thing is but a birch, so why throw up your head and lurch, a shame upon your scare! Shucks, that dim sound is but the wind, you act like one whose heart had sinned against the very fates, there are no dangers in the trees, or in the cool nocturnal breeze, no murder in the gates. Cut out the monkey shines, old top, cut out the nervous skip and hop, and be a horse of grit. Why act the baby in the night, you who by day are brave and bright, be calm and use your wit."

Yes, thus I lecture skittish Nig in phrases round, and strong, and big, in moral tones and clear; I lecture him like one, by gee, who never had a trembling knee, like one who knew no fear. But listen, just a while ago I faced six notes all in a row, all coming due at once, and sixteen pigs all died that day, while three fat gobblers ran away and left me only runts. The bank in which I had six bucks broke up like brittle peanut shucks, and hail fell in my oats, the mumps appeared among my geese, cried I, "Will terrors never cease? How can I meet those notes?"

"The night is dark," I cried, "alas, the gobblers will not let me pass, they have me by the neck; the spooks are dancing on my chest, they give me neither peace nor rest. I am a total wreck! What next? Ah, look! The sheriff comes right through the night to grab my thumbs and lead me off to jail. I am afraid, where shall I turn, my very eyelids smart and burn. I fear the dark. I fall."

How silly! Daylight came again, I held my place among the men, I had no spooks to flee. So, dear Old Nig, forgot the ghosts, they are but trees, they are but posts; you're far too much like me. J. E. T.

lowing the Peace through hilly country, much of it brule where fires had formerly burned the forest. Far to the west they could see high mountains, some of the peaks capped with snow. The thought that these would have to be passed filled the elder Woodbridge with a dread that was well-nigh despair. His was far from being the courage of Hannibal. "Beyond those summits of great pain" there lay no "Italy" for him.

Every night they chose a place for camping that could easily be fenced about to protect their stock and tent—a wise precaution on Milly's part, although Winthrop sometimes grumbled over the extra labor with the ax. Barty still followed them, greedily bolting whatever they had to throw to him. One night an elk, or else a moose, came trotting rapidly along the path by the river and actually stepped astride their fence before it perceived the horse and the tent. Suddenly aware of something unusual, it bounded away with a loud, shrill snort.

On another night, the eleventh, I think, after leaving Hudson's Hope, they were awakened by loud, angry growls from Barty. The dim "old" moon now gave but little light; yet as nearly as they could make out, another bear had approached, attracted, perhaps, by the odor of fish. Barty appeared to resent the presence of his congener. The growing on both sides was terrific. Winthrop took his gun to interfere, but while he was trying to catch sight of the obstreperous newcomer, both bears went off at a great pace. Barty was chasing the interloper, they thought, though how he managed to do so was not easily understood. Away they went, however, crashing through underbrush till they appeared to be fully a mile away. When an even louder uproar ensued for some time. The outcries indicated that more than two bears were now involved in the melee. The silent, dim wilderness reechoed to the uproar. Prehistoric dinosaurs in savage conflict could hardly have raised a more awesome rumpus. Yells as of extreme pain presently succeeded to the growls and roars of ferocity, and ere long the combatants appeared—from the sounds—to be racing off to a greater and greater distance, till finally the noise of their contention died away in the far forest.

Milly and Winthrop had stood listening with mingled feelings of solicitude and alarm. "Do you suppose poor Barty will ever come back?" the former exclaimed. "Oh, he will be back, if they haven't killed him," Winthrop replied. "Nothing less will keep him away from us."

But Barty had not returned when they went on next morning. "I'm afraid those other bears have mauled and mangled him till he has crawled away somewhere to languish and die," Milly said ruefully. "More likely he is merely lying up to recuperate," was Winthrop's opinion. "I wager we shall see him again within two days, hungry as ever."

"I SUPPOSE it is useless to try to look him up," Milly remarked a little later, as they took their way along the trail to the westward. She, too, believed that Barty would probably overtake them. In point of fact, however, they never saw him again;—and Freeman Woodbridge considered this a very good riddance from a troublesome camp-follower.

As they continued on toward the mountains of the central range of the Rockies, the hills encroached more upon the river valley, rendering the trail along the north bank difficult to follow. At times they were near losing it altogether in the thick spruce woods, and were delayed picking it up. Often there were windfalls across it which Winthrop had to cut away before the old horse and Bright-eyes could go on. Some days they made no more than three or four miles. In short they had far greater difficulties of this kind than we have space to recount; but there was no danger of becoming lost as long as they kept within sight or hearing of the river.

Two days after the quiet night when Barty disappeared, they met wayfarers on the trail in the form of four Indians, probably of the Beaver tribe. Winthrop was ahead at the time, cutting away a windfall, when hearing a low exclamation, he looked around and saw a squaw with a gun and a pack a few steps away, regarding him with a startled expression. Behind her came another squaw bent half double in the path, carrying on her back the only man of the party, who appeared to be taking matters easy. In the rear came still another squaw heavily loaded with their entire outfit, including a brown, sharp-eyed infant that peered fearfully over her shoulder.

(To be continued.)

The Farm Home

Guess-Work in Canning Is Wasteful

By GERTRUDE S. STEWART

THE farm home-maker who measures the health of her family and also counts dollars and cents is the woman who cans fresh vegetables and fine fruits every time she has a surplus. By "doing up" a few jars weekly, this thrifty woman is making possible a well-balanced diet at all seasons.

So many readers have written us during the past winter for help with their canning that we want to discuss with you some of the problems and better methods of procedure. One of the first and foremost rules of successful canning is to use products that are freshly gathered.

Pressure Cookers Are Insurance

The best known method of sterilizing the food we can has been the water bath method. This method is entirely successful for processing fruits, tomatoes, pickled beets and pimentos, but today the Bureau of Home Economics in the U. S. Department of Agriculture strongly advises using the pressure cooker for safely processing all non-acid vegetables. Their latest bulletin on canning No. 1471, does not give directions nor time tables for water-bath canning of asparagus, beans, baby beets, corn, greens, okra and peas.

All of these vegetables they recommend should be canned with the steam pressure canner. This is because of spoilage difficulties and the risk of poisoning from botulinus bacteria often not destroyed when non-acid vegetables are processed in the water bath.

Pressure cookers are specially designed for obtaining higher temperatures than can be reached in a water bath. They are strongly built, and the top clamps on so tightly that there is no leakage of steam when the cooker is closed. Other points to check in selecting a pressure cooker are: be sure the top is equipped with a safety valve, a thermometer and a pressure gauge.

Asparagus and Dandelion

Canned asparagus if done in the pressure cooker is a great delicacy. I never have enough to please us all winter. There are three ways to preserve it and all are delicious. Perhaps the very choicest method is to tie the tips in uniform bundles, stand them on end in a deep pan covering the lower tough portion with boiling water. Cover the pan tightly and boil five minutes. Then pack at once into hot sterilized jars, cover with hot liquid, add one teaspoon salt and process 40 minutes at ten pounds pressure.

The very same pressure and time apply to the tips cut in inch lengths. Then there are always culls and trimmings, which make wonderful puree for cold winter suppers. These you boil until soft, then press through sieve, add seasoning as desired.

pack hot and process for one hour at 15 pounds.

Dandelion, that earliest of all spring greens can be served all through the year if we gather it fresh and tender right now and can it. Just clean it thoroughly, steam it in a covered pan until entirely wilted. Pack it into hot jars (rather loosely) cover with fresh boiling water, add one-half teaspoon salt and process 90 minutes at ten pounds pressure.

If pressure cooker canning is entirely new to

you and you wish to study it more thoroughly, let us send you a booklet on the subject. Mail your requests at once to Home Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa. And don't forget the self-addressed stamped envelope.

Prize-Winning Cakes

Mrs. John S. Ramsey

HOW often when we were baking a cake for the Sunday School picnic, the Parent-Teachers Association Food Sale or the Saturday night Grange Supper, oh, how often we have wished for two recipes that sort of fitted together! Well, here they are:

White Walnut Cake

Two cups sugar, three cups sifted cake flour, five egg whites, one-half cup butter, one teaspoon vanilla, one cup sweet milk, two teaspoons baking powder, one cup chopped nut meats.

Blend butter and sugar until smooth and creamy. Sift flour and baking powder five times, then add to the first mixture alternately with the milk. Beat in the vanilla and nuts. Fold in the stiffly beaten egg whites. Bake in three layers in moderate oven for twenty minutes. When baking

Pressure cookers are great savers of fuel and time. Meats of tough cuts cook deliciously tender in one-third the usual time. Vegetables and puddings cook in pans on racks above the meats.

this cake, use the egg yolks to make the following delicious

Sponge Cake

One and one-half cups sugar, one cup scalded milk, five egg yolks, one-half teaspoon orange or lemon flavor, two cups sifted cake flour two teaspoons baking powder, two whole eggs, pinch salt.

Beat eggs slightly then add the sugar a little at a time, beating after each addition until very light. Add the hot milk and beat thoroughly then sift in the flour which has been sifted previously four times with the baking powder. Flavor, and bake in an ungreased tube pan for one hour in a very slow oven.

Note:—The contest editor has been thrilled with the many, many splendid cake recipes sent in and is sorry that many were submitted after April 5 when the contest closed as announced. Since we seem to be real baking enthusiasts, we will continue to print the very finest of these cake recipes as often as space permits. Checker-board cake pans will be sent to all prize-winners.

Cake Baking Editor.

My Daily Thank You

I LIKE Charles Kingsley's idea of the everyday gratitude. He says: "Thank God every morning when you get up that you have something to do that day which must be done, whether you like it or not. Being forced to work, and forced to do your best, will develop in you temperance and self-control, diligence and strength of will, cheerfulness and content, and a hundred other virtues which the idle will never know." G. S. S.

The Pennsylvania Hills

By MARGUERITE STEELE MCCREARY

KNOW no spot where springtime's half so bright
Nor any air so filled with charms and trills
No summer nooks so crammed with sheer delight
As here among the Pennsylvania hills.

The twilight cannot find a place so sweet,
Where with such tender, loving thoughts it fills
The heart, and bids it all things bravely meet
As here among the Pennsylvania hills.

I know no place where flaming autumn flaunts
Such gorgeous banners, gay with leafy frills
Then veils them in the sunset's purple haunts
As here among the Pennsylvania hills.

And softly, gently, winter's covering snow
Wraps field and slope in glittering silence, still
All nature—everything save winds that blow
Through whispering trees on Pennsylvania hills.

Sometimes through other scenes I chance to roam
I see and hear what people say are "thrills";
But best of all the "thrills" is getting home—
Back home among the Pennsylvania hills.

And when at eveningtime no more the west
For me will glow—come that day when God will
Then gently lay me on the quiet breast
Of one of Pennsylvania's sheltering hills.

Sing, Play and Be Happy

By MARION COSSITT BRACKIN

MUSIC will mean more to us as we grow older if we practice daily. For if our fingers are no longer supple, we can express ourselves any more than a run-down sewing machine will play records well. The studying music cannot yet know the deep joy of life's experience. What a shame then, knowing the riches of experience, am unable to express myself musically, merely because I do not keep up practice. I can live by music, keep it up. The energy and tempo of music enter into my daily actions. My days will go a nerve and I shall know intimately the spirit of leadership and accomplishment if I keep in with the harmonies of the great masters.

Music, played, works two ways. As I play spirit is freed; I am able to express myself, escape from my immediate surroundings, to young again though my years are many, to the secret of life though I am very young.

And, conversely, as I play, the spirit of the moment enters into me, enlivening me, giving me the ability to do, sweeping my mind clear of the cobwebs of doubt and hesitancy, giving me the power of splendid leadership, making my life vivid and beautiful and worth-while.

Will not this power come from merely listening to music? In this day of the radio, the average person has a wonderful opportunity for that. But the great power of music in life comes strongly on to those who can play or sing, who have spent an hour to spend, then let me spend minutes, even fifteen minutes a day. That alone will make a vast difference in my life.

There are two kinds of success in life; the outward and the inward; the success the world measures, and the success the inner individual craves and recognizes in himself. Music will surely lead my life toward both of these successes. It cannot fail to lead to success with its promptings toward strength and ability, toward leadership and accomplishment.

Can I spare the time for music? Shall I give my child a musical education? How can I afford or dare to do otherwise? I must not let it slip out of my life through carelessness nor through some fancied idea of being too busy. The busy my days, the greater do I need some little time each day expressing music. Let us keep up our music! We cannot afford to let it slip!

Note:—"Show me the home wherein music dwells," said Longfellow, "and I shall show you happy, peaceful and contented home."

Music Week, starting May 4, may be used as stimulus toward more making of music in the home by family and friends, with results such as Longfellow has outlined. In this way the Music Week Committee may bring about a literal realization of the slogan, "Music for Everybody—Everybody for Music."

Improve Your Wardrobe

HOW TO ORDER

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

No. 6832.—Misses' dress. Cut in three sizes: 16, 18 and 20 years. A 16-year size requires 1 1/2 yards of material 35 inches wide. To finish with bias binding requires 1/4 yard 1 1/2 inches wide. Ribbon sash requires 3 yards. Price 15c or two for 25c.

No. 6843.—Ladies' house dress. Cut in three sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38-inch size with long sleeves requires 4 yards 35 inches wide. With short sleeves 3 1/2 yards will be required. For collar, vestee and pocket flaps of contrasting material 1/4 yard 1 1/2 inches wide is required, cut crosswise. The width of the dress at the lower edge is 1 1/4 yards. Price 15c or two for 25c.

No. 6801.—Infants' set. Cut in one size, made as illustrated the dress will require 1 1/2 yards of 36-inch lawn or nainsook and 2 yards of edging 3 1/2 inches wide for the ruffle. The gown will require 1 1/2 yards of 27-inch material. The sack 1/2 yard of 27-inch material, and the cap 1/4 yard of 18-inch material. Price 15c or two for 25c.

No. 6820.—Ladies' dress. Cut in five sizes: 36, 38, 40, 42 and 44 inches bust measure. 36-inch size requires 3 1/4 yards of material 35 inches wide. To finish with bias binding requires 1/4 yard 1 1/2 inches wide. Price 15c or two for 25c.

No. 6838.—Boys' suit. Cut in four sizes: 4, 6, 8 and 10 years. A 4-year size requires 1 1/2 yards of 47-inch material. Price 15c or two for 25c.

No. 6833.—Ladies' morning frock. Cut in three sizes: 36, 38, 40 and 42 inches bust measure. A 38-inch size requires 3 1/4 yards of material 35 inches wide. To face with

contrasting material requires 1/4 yard 35 inches wide, cut crosswise. Price 15c or two for 25c.

No. 6254.—Ladies' step-in chemise, cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 2 1/2 yards of 32-inch material. To trim with lace bands will require 2 1/2 yards. Price 15c or two for 25c.

No. 6450.—Girls' slip. Cut in five sizes: 6, 8, 10, 12 and 14 years. A 12-year size requires 1 1/2 yards of material 36 inches wide or wider, if made with shaped shoulders. With straight top 1 1/4 yards will be required. To trim the straight top as illustrated requires 1 yard. Ribbon shoulder straps and a bow will require 1 1/2 yards. Price 15c or two for 25c.

No. 6837.—Ladies' blouse. Cut in five sizes: 34, 36, 38, 40 and 42 inches bust measure. A 38-inch size, with collar and sleeves requires 2 1/4 yards of 35-inch material. Without sleeves and collar, 1 1/2 yards will

Life is just one baking triumph after another

...when you've discovered Calumet's Double-Action

WHAT a joy to pull out of the oven those delicious-looking muffins—those light, perfect biscuits! Calumet's Double-Action brings you sure success in all your baking!

Calumet's first action takes place in the mixing bowl. This starts the leavening properly. Then, when you put your cake or muffins into the oven, the second action begins. A full, steady rising lifts your batter up and holds it, high and light—even though you may not be able to regulate your oven temperature with absolute accuracy.

All baking powders are required by law to be made of pure, wholesome ingredients. But not all are alike in their action. Not all will give you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce perfect leavening action—Double-Action. Because of this, it is the most popular baking powder in the world today.

Make a Calumet cake, or some biscuits. See for yourself what perfect results Calumet's Double-Action brings. Use only one level teaspoon of Calumet to a cup of sifted flour. This is the usual Calumet proportion and should be followed for best results. A real economy, too.

Mail the coupon for the new free Calumet Baking Book—full of wonderful recipes!

MAKE THIS TEST

Naturally, when baking, you can't see how Calumet's Double-Action works inside the dough or batter to make it rise. But, by making this simple demonstration with only baking powder and water in a glass, you can see clearly how baking powder acts—and how Calumet acts twice to make your baking better. Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's first action—the action that takes place in the mixing bowl when you add liquid to your dry ingredients. After the mixture has entirely stopped rising, stand the glass in a pan of hot water on the stove. In a moment a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's second action—the action that takes place in the heat of your oven.

Make this test. See Calumet's Double-Action which protects your baking from failure.

Calumet Baking Powder

Cooking and Heating

Gas

Both instantly and at your finger's tips with one system

Fresh Water

GAS... gas and fresh, running water! Gas instantly — and as easily as turning a water faucet! Dry, clean gas without a drop of liquid fuel in the house — and with a flame three times hotter than city gas.

Now you get complete relief from the drudgery of the hand pump, the stifling heat of a wood range or the nuisance of wicks to clean or burners to generate. All for only 10¢ to 30¢ more than the reasonable cost of a National Fresh Water System alone.

National FRESH WATER SYSTEM

No liquid fuel can enter your buildings.

Fresh water from any depth to 150 feet.

See How Simple and Safe

Air from National power unit mixes with special grade fuel in underground tank, leaving top outlet for appliances in house as clean, dry gas. Air also operates water pumps in well, cistern, stream or lake. Opening of any faucet automatically causes pump to operate.

Do You Read?

I AM a homemaker and would hardly know how to go about my job without my magazines. From them I learn how to make my clothes so as not to look "too dowdy," how to prepare new dishes which my family tires of old ones, how to furnish my home in good taste, though I'm poor, what the newest and best products are on the market and why they are best, what ails my chickens when they sit down and shut their eyes, how to make soap and how to keep a husband.

Then there is no estimating the value to children of acquiring the reading habit; it not only supplements knowledge gained at school but makes it easier for the child to learn dry facts from the text if he has other reading on the same subject with which to embellish these facts. Starved indeed is the child's mind that is fed on nothing but text books, yet I have known many such.

Personally I think it much more important that school children have a conversing knowledge of what Edison, Ford, Hoover, Lindbergh and other great men are doing than to know the deeds of Caesar and Charlemagne.

Wasting Time!

I would like to mention another advantage to farm people, of reading, which is not so apparent. Were you ever made to feel embarrassed and ill at ease in the presence of some one who seemed to have had better educational advantages than you? Reading will give you poise and ease of manner; it gives you knowledge and knowledge is power; it will open the door to the house where the great, the good and the wise live and you may get acquainted with them and know them as friends.

Why can't something be done to urge more reading among rural people? I may be wrong but it seems to me this failure to take advantage of solutions to farm problems as they are found in farm and home periodicals is the greatest hindrance to farm progress. In our own community where I am familiar with the homes I find a deplorable dearth of current reading material. The idea seems to be that time spent in "sitting around reading" is time wasted.

Mrs. H. L. James.

Hints for Homemakers

IF your old wooden drain board is the worse for wear, buy a piece of embossed inoleum, fit it to the board, and tack it down. The water will follow the indentations, and the inoleum is soft enough to prevent the chipping of your dishes.

Glazing adds a gay and appetizing touch to meats. In barbecuing beef, sear and brush frequently with the glazing syrup which is made by boiling, until the sugar is dissolved, one cup sugar, one-fourth cup water, and two tablespoons lemon juice, and then

Mollie's Hat

THE first show I ever saw Uncle Tom's Cabin, and I walked five miles for the chance, or rather started to walk. It was a hot day in haying season, and father could not leave such work for any one but the big posters had stirred me and I was simply wild to go.

Mollie, my best friend in all the undertakings, lived on the next farm. She wanted to go, too, and finally her parents consented that we might go to the show. An uncle living in town would be entrusted to bring us home.

We started early in the morning and the sun was never so bright, and the skies so blue. We were very happy. After we had finished the miles of the journey a gentleman on a horse and buggy overtook us and invited us to ride.

Although this occurred way back in the 'eighties,' we were not so bashful for little country girls of eleven and "in we stepped," and what a time we were soon speeding behind him. He was like a wild wind.

The kind man sat in the middle of the seat, pretty near the edge, and we were on each side of him. He could smile to each other and he could not see us, but a sudden gust of wind took Mollie's hat, and she signalled me to tell our kind benefactor. I signalled back for her to tell him herself. But she was too shy, and I was I. And besides, it was her hat, not mine.

The horse raced on, and we kept motioning back and forth about the hat. It was Mollie's very best hat, now far out of sight. At last Mollie piped out, "Oh, mister, I lost my hat!" He just said, "You did? Where?" and poor Mollie replied, "Back there."

In jiffy time we had the hat and were soon in town. We went out to Uncle at once where we had lunch and the off to the show. What joy and bliss seeing Eva and Topsy! How thrilling we were when Eliza crossed the street. It was a wonderful show and we were so elated over it that uncle wanted to see it, too. So he took us again that same night.

In later life I learned to know the "buggy man" as we called him. We are very good friends and have many a hearty laugh about "Mollie's hat."

Canning Greens

I DON'T suppose there is a farmer's wife who could not keep two weeks busy with the work she is supposed to do herself, so that she must decide on the most important, and be the rest good. I generally pay pretty close attention to canning, because the winter is so long.

I gather the stalks, pick them carefully, wash in as many waters as necessary for the last one to be perfectly clear, put in a kettle and cook in water until well wilted, then pack in pint jars, with one teaspoon of one of sugar and one tablespoon of vinegar. Screw on the caps loosely, pack the jars in a kettle with cloth about them so they will not knock together and crack, and boil for two hours. (I have never achieved a pressure cooker, although I live in hope. Tighten the lids and store away in dark cupboard.

F. C. Hebel.

Fireplace Philosophy

I HAVE been "keeping back" the last few days. Having roughed it at odd times in my life this was an opportunity to pull up the rug in the west sitting room and start an open fire on the hearth I played at fifty years ago. Two other generations of men have a way of coming and going as I sit in the firelight—the hoary bearded face of grandfather, staid old man, and the tap of father's restless foot on the hearth.

My fuel is odds and ends of stuff, timbers from an old barn now replaced by new; posts from discarded fences and fences that justified replacement; wooden pieces from disused implements, some worth while in their day and others may be on the order of mere flukes; occasionally a full grate basket of dry and flashy corn cobs; now and then a neat section of fence rail that served its days and generations well, its very presence at my fireside at this time bearing valiant testimony to the tough and rugged fiber of its makeup. My fuel speaks to me—words of encouragement, words of caution, words of wisdom gleaned from its sundry service through the years.

A Balance of Life's Compensations

Spring instills into these thoughts many reflections of past springs and aspirations for the baby spring now born. Who should be surprised if I saw in the dancing flames or in the glowing coals a balance weighing the compensations of life—betimes a bulky mass of something seems to weigh so little and betimes an apparently insignificant bit bears down the scale beam with amazing effect!

Grandfather bought this farm in 1827. Maybe he sat one hundred years ago tonight on this very spot in his cabin before his other glowing or smouldering fire and wondered, reflected on the compensations of life also. He lived simply, he lived long, he lived well—at the ripe age of 81 he passed on a suitable heritage of "worldly goods" and an exemplary heritage of rugged character. I remember his linchpin wagon and grandmother's rumbling old loom. His flail still hangs in the barn.

He once told me that when he became lost in the thick woods at night he kindled a fire and waited for dawn lest he wander further and further from the destination to which he was going. As I look into my comfortable fire tonight I think of his fire—and think of its purpose. In this day of unnumbered wants and countless luxuries they stand like a forest around us, something grim and terrible in which we may go rushing ahead and get lost—forget the safe and quiet destination at which we are bound to arrive with caution in our steps.

Why All the Rush?

The world is full of other men—I don't need to scoop the last clod I can get onto the shovel! The bandwagon is full to overflowing with a clamorous crowd. Why should I kill body and spirit to pay the price of the bright uniform necessary to ride? The world is already overplowed; why should I tear up more and more ground with near frenzy? The world is overfed; why drag by the ears more stubborn fat hogs than one man is due to deliver?

So, as I cast a little of this and a little of that other into the balance of compensations I seem to see in the fire before me, I believe that I am going to have a sensible summer. I believe that I am going to be an average industrious and an average re-possessive farmer the coming year. I like this comfortable age in which we are living, but why play the breathless game of get-and-have to a dead and dropping finish? I like to sit before the little old grate once more and let the furnace cool off in a mild spell. When the hat comes round and round to pay the fiddler for later and later hours there comes a time to quit throwing in the handkerchief.

Hiram Dobbin.

WHERE... SHOULD A FARMER DRAW THE LINE?

You know there are few farmers — and few city people, too — who can have everything they want.

Every farmer draws a line.

On one side are the necessities, the things he must have to run his farm — food, clothing, seed, gasoline, implements. On the other side of that line are "Luxuries"—things he can get along without, unproductive things, ornamental things. He wants them—but he looks upon them as things to be bought some day in the future.

At first thought you may say electricity is a luxury; that you're going to have it some day, but not this year.

But is it a luxury?

Three hundred and fifty thousand farmers who use Delco-Light emphatically say: "No, it is not." They say Delco-Light is a necessity. They say it's a profit-producer.

They also say that along with this necessity that saves time and work, and actually increases their farm profits, they got—without any cost—all the luxuries made possible by electricity.

Let us send you the facts now

Don't let YOUR CROPS get Indigestion

CROPS get indigestion just as humans do, when they eat the wrong food. Can't eat and don't grow right. Feed them Chilean Nitrate of Soda and watch their joyous response. Roots suck it up quickly. Plants get new vigor. Grow faster. Give greater yield.

Chilean Nitrate is the world's only *natural* nitrate. Its nitrogen is quickly and easily digested. All plants like it. Use as side dressing for corn. Prevents "firing." Makes more and larger ears per stalk. Fruit trees and truck quit loafing on the job and produce better crops. More important this year than ever to increase per acre production in view of lower prices. Liberal use of Chilean Nitrate is the make-sure way to crop-success.

Chilean Nitrate is always the same good, old dependable source of rich nitrogen. Now is the time to buy it. A few cents now puts dollars back in your pocket when crops are sold.

Free Fertilizer Book

New book, "How to Fertilize Your Crops," tells how to use Chilean Nitrate of Soda to get best results. Free. Ask for Book No. 1, or tear out this ad and mail with your name and address written on the margin.

The High Cost of False Economy

TWENTY potato growers took losses averaging \$10. per acre, while one neighbor realized a net profit of \$95. per acre, because he sprayed well and often, despite the probability of a low potato market. Neglect of adequate spraying—wet or dry season—high or low market—is the most short-sighted form of economy a grower can practice. It is equally short-sighted to try to save a cent or two on Copper Sulphate (Blue Vitrol) and risk a weak mixture, due to excess of dirt and other inert matter. Make sure your Bordeaux Mixture is correctly proportioned, whether you employ the Standard method or the new "instant" method of preparing it, by using only

Nichols Triangle Brand Copper Sulphate "Blue Stone"

HORTICULTURE

By S. W. FLETCHER

Peaches Fall

Where can I get information on the care and spraying of half a dozen peach trees which bear but the peaches fall off before ripe?
Mrs. Raymond Snyder,
York county, Pa.

AN efficient and economical method of protecting a few trees in the home orchard from insect pests and diseases has not yet been developed. One method would be to employ a commercial grower to spray these trees, but this would be quite expensive. You can buy a small, hand sprayer, mounted like a wheelbarrow, with a hose, rod and nozzle. This answers the purpose fairly well for the small home orchard. Another, and perhaps a better method, since you are concerned chiefly with peaches, is to buy a small hand duster and apply the chemicals in dust form. The regular commercial spraying or dusting schedule need not necessarily be followed in all respects.

In general, your peaches should have a spray of lime-sulphur solution, dormant strength, in early spring (usually before March 15); and several sprays of self-boiled lime sulphur and arsenate of lead, beginning immediately after the blossoms fall. If a dust is used, it should be of sulphur and arsenate of lead. Your county agent can advise you in detail on equipment materials to use and time of application.

Frost Injury

Will you please tell us what is the trouble with three apple trees we have? They bloom every spring, but no fruit stays on. They are planted near a pond. We have sprayed them. F. D. Elk county, Pa.

THIS may be due to annually recurring frost injury to the blossoms; apple trees planted "near a pond" are likely to be on a frosty site. There is no practicable remedy for this.

It may be due to the attack of fungous disease, particularly apple scab. Have you given each year the several sprays necessary for the control of apple scab? This involves, in general, the use of a lime-sulphur spray before the blossoms open, immediately after the petals fall, and perhaps twice thereafter.

If you are satisfied that neither frost nor disease are responsible, you may suspect that the trouble is lack of cross pollination. Top grafting some of the limbs with other vari-

H. C. Keptinger of Grant county, Virginia, finds sugar making possible work.

eties, blossoming at the same time may remedy this.

If the trees are young you need not be disturbed; young trees often do not set fruit, though blossoming.

Bitter Pit

We have about 750 apple trees of various ages from one year old to 45 years. We have been spraying for the past 10 years. Last year we had about 100 bushels of apples that were ruined with bitter pit and apple maggot.

Would you cut these trees off about six inches above the ground and put a new top or will the whole tree be from life effects?
W. M. Bradford county, Pa.

THERE is no practicable preventive for bitter pit. Some varieties, as Baldwin, are more susceptible than others. It is more likely to occur on young, rapidly growing trees than on mature trees; and in a season, like last summer, than in a season of normal rainfall. Over-irrigation favors it. You should be able to control the maggot, however, with arsenical sprays and other measures.

Cranberry Disease

RESPONSIBILITY for the spread of false blossom, a serious cranberry disease which threatens to New Jersey's extensive cranberry industry, rests with the tiny, bluish-ed leafhopper, according to entomologists at the State Experiment Station.

This three-row potato planter was put in operation in Chester county, Pa., this spring. In a test it planted an acre in 38 minutes. It is set to plant ten inches in 30-inch rows.

Note the deep planting and shallow covering, sometimes called "W" or truck planting. This scheme is used by many of the 400-bushel potato growers.

it saves you money!

No single feature of the new Chevrolet Six is praised more highly than its outstanding economy—for in spite of its greater power and finer all-round performance—*this new Six saves you money every mile you drive!*

From first cost to re-sale value—it pays to own a Chevrolet.

With a base price of \$495, f. o. b. factory, the Chevrolet Six is one of the world's lowest priced automobiles—actually in the price range of a four-cylinder car. And this initial economy is emphasized over and over again as the months and the miles go by.

Exceptionally high gasoline mileage! Oil economy that never ceases to amaze you! Dependability in every part that reduces your service requirements to the minimum! Long life that far exceeds

the demands of the average owner! And standardized service available everywhere—with low flat-rate charges to cover every operation!

Purely on the basis of economy—the Chevrolet Six is the logical car to own. But when you consider what it gives you *in addition to* economy—in six-cylinder performance, in beautiful Fisher bodies, in greater comfort, safety and handling ease—its choice becomes imperative, if you seek *value*.

See your Chevrolet dealer today. He will gladly give you a demonstration of this wonderful Six.

Don't let YOUR CROPS get Indigestion

CROPS get indigestion just as humans do, when they eat the wrong food. Can't eat and don't grow right. Feed them Chilean Nitrate of Soda and watch their joyous response. Roots suck it up quickly. Plants get new vigor. Grow faster. Give greater yield.

Chilean Nitrate is the world's only natural nitrate. Its nitrogen is quickly and easily digested. All plants like it. Use as side dressing for corn. Prevents "firing." Makes more and larger ears per stalk. Fruit trees and truck quit loafing on the job and produce better crops. More important this year than ever to increase per acre production in view of lower prices. Liberal use of Chilean Nitrate is the make-sure way to crop-success.

Chilean Nitrate is always the same good, old dependable source of rich nitrogen. Now is the time to buy it. A few cents now puts dollars back in your pocket when crops are sold.

Free Fertilizer Book

New book, "How to Fertilize Your Crops," tells how to use Chilean Nitrate of Soda to get best results. Free. Ask for Book No. 1, or tear out this ad and mail with your name and address written on the margin.

Write for samples and circular. **WHEO, BURT & SONS**, Box 50, Melrose, Ohio.

The High Cost of False Economy

TWENTY potato growers took losses averaging \$10. per acre, while one neighbor realized a net profit of \$95. per acre, because he sprayed well and often, despite the probability of a low potato market. Neglect of adequate spraying—wet or dry season—high or low market—is the most short-sighted form of economy a grower can practice. It is equally short-sighted to try to save a cent or two on Copper Sulphate (Blue Vitrol) and risk a weak mixture, due to excess of dirt and other inert matter. Make sure your Bordeaux Mixture is correctly proportioned, whether you employ the Standard method or the new "Instant" method of preparing it, by using only

Nichols Triangle Brand Copper Sulphate "Blue Stone"

Large and small crystals, Powder and "Snow" (Minute Crystals). Write for free booklet on preparation and use of Bordeaux Mixture with directions for preparing "Instant" Bordeaux.

HORTICULTURE

By S. W. FLETCHER

Peaches Fall

Where can I get information on the care and spraying of half a dozen peach trees which bear but the peaches fall off before ripe?
Mrs. Raymond Snyder,
York county, Pa.

AN efficient and economical method of protecting a few trees in the home orchard from insect pests and diseases has not yet been developed. One method would be to employ a commercial grower to spray these trees, but this would be quite expensive. You can buy a small, hand sprayer, mounted like a wheelbarrow, with a hose, rod and nozzle. This answers the purpose fairly well for the small home orchard. Another, and perhaps a better method, since you are concerned chiefly with peaches, is to buy a small hand duster and apply the chemicals in dust form. The regular commercial spraying or dusting schedule need not necessarily be followed in all respects.

In general, your peaches should have a spray of lime-sulphur solution, dormant strength, in early spring (usually before March 15); and several sprays of self-boiled lime sulphur and arsenate of lead, beginning immediately after the blossoms fall. If a dust is used, it should be of sulphur and arsenate of lead. Your county agent can advise you in detail on equipment materials to use and time of application.

Frost Injury

Will you please tell us what is the trouble with three apple trees we have? They bloom every spring, but no fruit stays on. They are planted near a pond. We have sprayed them. F. D. Elk county, Pa.

THIS may be due to annually recurring frost injury to the blossoms; apple trees planted "near a pond" are likely to be on a frosty site. There is no practicable remedy for this.

It may be due to the attack of fungous disease, particularly apple scab. Have you given each year the several sprays necessary for the control of apple scab? This involves, in general, the use of a lime-sulphur spray before the blossoms open, immediately after the petals fall, and perhaps twice thereafter.

If you are satisfied that neither frost nor disease are responsible, you may suspect that the trouble is lack of cross pollination. Top grafting some of the limbs with other vari-

H. C. Keptinger of Grant county, Virginia, finds sugar making possible work.

eties, blossoming at the same time may remedy this. If the trees are young you need be disturbed; young trees often set fruit, though blossoming late.

Bitter Pit

We have about 750 apple trees of ages from one year old to 45 years. We have been spraying for the past years. Last year we had about 100 bushels of apples that were ruined with bitter pit and apple maggot.

Would you cut these trees off six inches above the ground and put a new top or will the whole tree be from the effects?
W. M. Bradford county, Pa.

THERE is no practicable preventive for bitter pit. Some varieties, as Baldwin, are more susceptible than others. It is more likely to occur on young, rapidly growing trees than on mature trees; and in a season, like last summer, than in a season of normal rainfall. Over-irrigation favors it. You should be able to control the maggot, however, with arsenical sprays and sanitary measures.

Cranberry Disease

RESPONSIBILITY for the spread of false blossom, a serious cranberry disease which threatens to New Jersey's extensive cranberry industry, rests with the tiny, blunted leafhopper, according to entomologists at the State Experiment station.

This three-row potato planter was put in operation in Chester county, Pa., this spring. In a test it planted an acre in 38 minutes. It is set to plant ten inches in 30-inch rows.

Note the deep planting and shallow covering, sometimes called "mound" or truck planting. This scheme is used by many of the 400-bushel potato growers.

Every mile— it saves you money!

No single feature of the new Chevrolet Six is praised more highly than its outstanding economy—for in spite of its greater power and finer all-round performance—this new Six saves you money every mile you drive!

From first cost to re-sale value—it pays to own a Chevrolet.

With a base price of \$495, f. o. b. factory, the Chevrolet Six is one of the world's lowest priced automobiles—actually in the price range of a four-cylinder car. And this initial economy is emphasized over and over again as the months and the miles go by.

Exceptionally high gasoline mileage! Oil economy that never ceases to amaze you! Dependability in every part that reduces your service requirements to the minimum! Long life that far exceeds

the demands of the average owner! And standardized service available everywhere—with low flat-rate charges to cover every operation!

Purely on the basis of economy—the Chevrolet Six is the logical car to own. But when you consider what it gives you in addition to economy—in six-cylinder performance, in beautiful Fisher bodies, in greater comfort, safety and handling ease—its choice becomes imperative, if you seek value.

See your Chevrolet dealer today. He will gladly give you a demonstration of this wonderful Six.

More vigor per spoonful... GRAPE-NUTS

HOW often a woman's vitality is like a see-saw. Now up! Now down! One side says "let's go places, and have a good time." The other side says "let's not—it's just too much trouble."

How we welcome the days when our vitality is brimming over—when even our daily duties are faced light-heartedly and zestfully. For these are the days when vigor and energy make every hour bright with the joy of living.

Why doesn't every day bring us this feeling of eager vivacity? What's wrong when we're low-spirited and apathetic—when we can't pull our-

selves together to do the things we'd like to do?

Look for an answer in the food you eat. For food, day by day, must rebuild the body and recharge it with vital energy. And only the right kind of food can do the right kind of job!

If you want all-around health, exuberant energy and vitality, see to it that your food, every day, gives you all the building, energizing elements your body needs.

There is one food long known for the contribution it makes to building and fueling the body—a food which gives us a tremendous amount of energy in proportion to the amount eaten. This food is Grape-Nuts—purposely designed to give you the nourishment that produces healthful vigor, buoyant energy—and to give it to you in a form that is temptingly delicious.

Grape-Nuts is made of choice wheat and malted barley. It is abundant in dextrins, maltose and other carbohydrates, the chief producers of energy.

In addition, Grape-Nuts provides vital elements often lacking in the modern diet—iron, for the blood; phosphorus for teeth and bones; proteins for muscle and body-building; and the essential vitamin-B, a builder of appetite.

And Grape-Nuts invites eating. Its golden-brown

kernels, tinged with purest malt sugar, are crisp and crunchy. Not only does this crispness add deliciousness—it also encourages thorough chewing to help digestion. And gives to teeth and exercise they need to remain sound and healthy.

Start now to make breakfast build vital health and energy for you. Buy Grape-Nuts today for breakfast tomorrow! Your grocer sells Grape-Nuts—a Product of General Foods Corporation. Or send coupon below for free trial offer.

GRAPE-NUTS MAKES THE SMALL BREAKFAST SAFE
A single serving of Grape-Nuts with cream provides more varied nourishment than many a hearty meal. Add Grape-Nuts to your breakfast.

You'll never know how delicious some dishes can be . . . until you make them with GRAPE-NUTS

THE SAME delightful flavor that has made Grape-Nuts the breakfast choice of millions—also adds zest and variety to many delicious luncheon and dinner dishes.

Use Grape-Nuts in some of your favorite recipes. Or for sprinkling on other dishes. And be sure to try the special Grape-Nuts recipes below.

Thousands of women have found that these tempting dishes bring pleased comments from the entire family. We're sure you will, too.

GRAPE-NUTS MOCK HAMBURG STEAK

- 1 cup lentils
- 1 cup Grape-Nuts
- 2 onions, grated
- 1 teaspoon salt
- 1 teaspoon powdered sage
- 1 tablespoon melted butter
- 2 eggs, well beaten

Soak lentils in water overnight. Cook in same water until soft. Drain and force through sieve. Add other ingredients in order given and mix thoroughly. Place by tablespoons in hot greased frying-pan. Flatten with spoon into cakes and brown on both sides. Serve with brown gravy or tomato sauce. Serves 6. (All measurements are level.)

GRAPE-NUTS BAKED CUSTARD

- 1 cup sugar
- 1/8 teaspoon salt
- 1/2 teaspoon vanilla
- 2 cups milk
- 2 eggs, slightly beaten
- 5 tablespoons Grape-Nuts

Add sugar, salt, vanilla, and milk to eggs. Strain. Put 1 tablespoon Grape-Nuts in each custard cup and pour in custard mixture. Place cups in pan of hot water. Bake in moderate oven (350° F.) 35 minutes, or until a knife inserted comes out clean. Serves 5.

GRAPE-NUTS ICE CREAM

- 1 tablespoon flour
- 1/2 cup sugar
- 1/8 teaspoon salt
- 1 egg, slightly beaten
- 2 cups milk, scalded
- 1 cup cream
- 1 tablespoon vanilla
- 1/2 cup Grape-Nuts

Combine flour, sugar, and salt. Add to egg. Pour small amount of milk over egg mixture, stirring vigorously. Return to double boiler and cook until thickened, stirring constantly. Cool. Add cream and vanilla. Freeze. When partly frozen, add Grape-Nuts. Continue freezing until firm. Serves 6.

GRAPE-NUTS STUFFED CARROTS

- 8 medium-sized carrots, cooked
- 1/4 cup grated cheese
- 1/2 cup Grape-Nuts
- 2 tablespoons green pepper, chopped
- 1 tablespoon milk
- 1/4 teaspoon salt
- 1/8 teaspoon pepper
- 1 1/2 cups cooked rice

Hollow out one side of each carrot. Remove thin slice from other side so that it will rest firmly in pan. Add cheese, Grape-Nuts, green pepper, milk, and seasonings to rice. Stuff carrots with mixture. Place in greased baking dish. Bake in hot oven (400° F.) 20 minutes, or until brown. Garnish with parsley. Serves 4.

Why six farmers changed their orders to Mobiloil

What an Oklahoma tractor dealer discovered about quality lubrication and tractor economy

The agents for a well-known tractor in a thriving Oklahoma town also supply lubricating oil to most of the farmers purchasing machines from them. Two brands are carried—Mobiloil, and a cheaper oil.

This dealer frankly admits that he used to think Mobiloil was too high-priced for tractor use. His cheap oil seemed to lubricate well enough, and his customers saved a few cents per gallon on it.

But—that was before his company started overhauling the tractors they sold.

This year they offered free service to their customers for the first time. Some twenty tractors have been inspected, valves ground, and necessary repairs made.

What inspection proved about Mobiloil economy

"Without exception," reports this dealer, "the tractors that had been lubricated with Mobiloil were in much better condition—had less carbon—needed fewer repairs. It was remarkable. Several that had been in use for three or four seasons

didn't even need to have the valves ground, while a number that had been run with that other oil had to have new pistons as well as other replacements.

"Of course I've been telling our customers what we discovered—for their own good. And six of them who already had orders in for a season's supply of the other oil have asked me to change them to Mobiloil."

Besides the yearly saving in wear and tear and repair, regular use of Mobiloil cuts nickels off your fuel and oil bill every working day. It *lasts longer*—covers more acres per gallon.

See the complete Mobiloil Chart at your dealer's for the correct grade to use in your car, truck or tractor.

NOTE: For a season's supply we recommend the 55-gallon or 30-gallon drum with convenient faucet.

Garden and Truck Crops

By GILBERT S. WATTS

Red Raspberries

I have quite a nice patch of Latham red raspberries. Last fall I used horse and cow manure heavily in the rows. This spring I expect to use sheep and chicken manure. Can I use this too strong? What fertilizer should I use with this manure? D. H. M. Snyder county, Pa.

PROBABLY the most important soil factor in securing profitable yields of red raspberries is a liberal supply of organic matter.

If growth last year was heavy I would question the advisability of using sheep or chicken manure except as a very light top-dressing. Enough nitrogen for vigorous growth but not sufficient to cause a weak, sappy growth late in the season is a good rule.

Some growers feel that a spring application of a few hundred pounds per acre of a complete fertilizer is advisable. G. S. W.

Lettuce Won't Head

Can you give me any information regarding head lettuce? I have tried to raise some each season, but always failed, even though I followed directions on packets very carefully. They never grew into a head—just leaves. Pray, what is done to make them head? Greene Co., Pa., Mrs. Chas. B. Fordyce.

EVEN with the most skillful commercial growers head lettuce is inclined to be an uncertain crop throughout most of this state. Apparently we too frequently experience the combination of high temperatures and high humidity and much of our soil is not of an ideal lettuce type.

In general your chances of success will be best if you attempt to grow head lettuce as an early spring crop or as a late fall crop, sowing about July 15 to 25. Select a fertile soil and do not apply commercial fertilizers too heavily, especially if very strong in potash. G. S. W.

Cucumbers Fail

I want some advice on raising cucumbers. Last year I had lovely vines and they began to blossom and then they began to wither and dry up, one by one, until they were all dead. We got very few cucumbers and they were not nice. Mrs. C. E. Kelsey, Jefferson county, Pa.

YOUR failure with cucumbers last year was no exception. Very few satisfactory crops were produced in gardens or truck patches.

The important details in cucumber growing are to plant in a fertile soil that contains an abundance of organic matter, to keep insects under control—they not only do direct damage but spread disease on their mouth parts, and to thin out the surplus young plants before crowding begins.

I hope you may have a full crop this year. G. S. W.

Worms in Radishes

Will you please inform me what causes radishes to be so badly infested with little worms? Also tell me what the ground should be treated with in order to produce good results with early radishes. Would like to know the most desirable variety to plant early. Are the white radishes preferred to the red ones?

What kind of cabbage is best for winter keeping? What about Luther Burbank's new tomato? Does it mature early as the plants from the hot house? Are there any particular instructions to follow in order to have good results with Lima beans? Mrs. Raymond Snyder, York county, Pa.

WORMY radishes are caused by the cabbage maggot. In a wooden or earthen vessel dissolve one ounce corrosive sublimate in eight gallons of water. Pour this into the soil close beside the young radish or cabbage plants, using enough solution to saturate the soil. Repeat at ten-day intervals, making three applications in all.

Early radishes should be fertilized liberally with fine rich manure or with

commercial fertilizer rich in nitrogen. Early Scarlet Globe is the variety grown most widely. White radishes usually sell well if you can get them a pure, bright white, a thing that is not easy except in light soils.

Danish Ballhead (Short Stem) is the best winter keeping cabbage, but is not as tender as Enkhuizen Glory, a variety that may be kept until the New Year, or a little later under favorable conditions. Sow Danish seed the middle of April, Enkhuizen for winter use two or three weeks later. Sow outdoors.

I am not familiar with Luther Burbank's new tomato that you mention, but would plant mostly of the old standards until I had grown it in comparison.

Lima beans usually produce most abundantly on a warm, fertile soil. That is, plant in a somewhat sandy or gravelly, but not drouthy, soil if possible. Henderson's Early Giant Bush Lima has been a most productive sort in my plantings of the dwarf types. Of the tall varieties Early Leviathan and Challenger or Potato are popular. G. S. W.

THE MARKET PLACE

By W. R. WHITACRE

YEARS ago when our markets depended on nearby sections for their supplies, the earliest produce was the most profitable. The first bunches of asparagus of the season sold as high as \$1 or more a bunch and other vegetables brought relatively high prices. The development of market gardening in the South and the improvements in transportation brought these vegetables to the northern markets far in advance of home-grown products. The growers in the North complained that they were unable to obtain as high prices early in the season as in former years.

There is a brighter side to the situation that has often been overlooked. For instance, this season there is a liberal supply of asparagus of excellent quality on the market from South Carolina and California. It is selling at prices that are within the reach of the average family, and it is being featured by chain stores and the smaller produce stores throughout the city.

I believe this is a benefit to the nearby producer, since people get the "asparagus habit." When New Jersey and Pennsylvania begin to ship freely they will continue to buy and while the extra high prices will probably not be realized, the average for the season is likely to be better. A reasonable price for good goods means more consumers while the higher price means that fewer people can afford to purchase. The people who can afford to buy out-of-season products and pay high prices for them are in the minority, their tastes are fickle and they cannot be counted on as a real outlet when things are plentiful.

Last season's strawberry season was an excellent illustration of this idea. The season opened with liberal supplies of good berries at fair prices and there were few extremely high or low prices. One essential to this idea is that the first produce shall be of good quality, a good buy. One trouble with the peach crop in New Jersey in late years has been the fact that it opened with such varieties as Greensboro that cannot be considered desirable from any point of view. In this case the inferior fruit comes on the market at the same time that the cream of the Southern crop is offered, which further complicates the problem.

The first bunches of asparagus of the season sold as high as \$1 or more a bunch and other vegetables brought relatively high prices. The development of market gardening in the South and the improvements in transportation brought these vegetables to the northern markets far in advance of home-grown products. The growers in the North complained that they were unable to obtain as high prices early in the season as in former years.

There is no doubt that this is true, but there is a brighter side to the situation that has often been overlooked. For instance, this season there is a liberal supply of asparagus of excellent quality on the market from South Carolina and California. It is selling at prices that are within the reach of the average family, and it is being featured by chain stores and the smaller produce stores throughout the city.

I believe this is a benefit to the nearby producer, since people get the "asparagus habit." When New Jersey and Pennsylvania begin to ship freely they will continue to buy and while the extra high prices will probably not be realized, the average for the season is likely to be better. A reasonable price for good goods means more consumers while the higher price means that fewer people can afford to purchase. The people who can afford to buy out-of-season products and pay high prices for them are in the minority, their tastes are fickle and they cannot be counted on as a real outlet when things are plentiful.

Last season's strawberry season was an excellent illustration of this idea. The season opened with liberal supplies of good berries at fair prices and there were few extremely high or low prices. One essential to this idea is that the first produce shall be of good quality, a good buy. One trouble with the peach crop in New Jersey in late years has been the fact that it opened with such varieties as Greensboro that cannot be considered desirable from any point of view. In this case the inferior fruit comes on the market at the same time that the cream of the Southern crop is offered, which further complicates the problem.

"The best corn in the locality"

That's what Carrie Neff, R. No. 2, Boonville, N.Y., grew after treating seed corn with Stanley's Crow Repellent. "The crows," writes Carrie Neff, "did not pull the corn. They ate the grubs and other corn enemies, instead." Thousands of other up-to-date farmers use Stanley's Crow Repellent to keep crows, moles, gophers, chucks, squirrels, etc., from pulling the seed-corn. It will not injure the seed or clog planter. Non-poisonous. But sure to keep pests out of fields. If your hardware, drug or seed store can't supply, address The Cedar Hill Formulae Co., New Britain, Conn. Box 500 R.

Be Ready with a New John Deere Mower

WHEN haying time comes, you want a mower you can depend upon to do a good job of cutting—a mower that will stand up under heavy work and stay on the job day after day without losing time. You can't afford to use a mower that will do less—time is money when there's hay to make.

The John Deere mower has proved its ability to do better work and last longer. Owners in your community will tell you about its satisfactory performance. They will tell you it handles easier because of the high, easy lift. They'll tell you it's lighter in draft—easier on the horses.

Direct transmission of the power through two pairs of perfectly-balanced gears lightens the draft and reduces wear. The twenty-one point clutch insures instant starting of the knife—a big advantage in heavy cutting. High-quality materials and high-grade workmanship throughout assure long life and low up-keep costs.

What John Deere mower owners think of their John Deere mowers is the subject of a new folder, "In Their Own Words." Letters from every section of the country tell a story you should know. Write TODAY for your free copy. Address John Deere, Moline, Illinois, and ask for booklet MHI-83.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

COP-R-LOY

THE COPPER ALLOYED STEEL

Adds Years of Life to

Wheeling FENCE

Your Wheeling dealer has the biggest value in fence for you! Wheeling Fence!—The only fence on the market that is made of COP-R-LOY, the Copper Alloyed Steel. Not only made of this finer steel that definitely resists rust and corrosion—but with a durable coating of pure zinc as EXTRA PROTECTION. This is the combination that assures you long service and economy in fencing.

But Wheeling value does not stop there! Wheeling Fence is tested and stretched up in Wheeling mills before shipped to your dealer. You know that you are getting full weight, full gauge wire fence—and you know that it will stretch up right. Another feature—the Wheeling Hinge Joint—it gives extra strength and flexibility.

Ask for Wheeling Fence to obtain all these money-saving features at low cost. See your Wheeling Fence dealer today.

WHEELING CORRUGATING COMPANY, Wheeling, West Virginia
Branches: New York, Buffalo, Philadelphia, Chicago, Kansas City, St. Louis, Richmond, Chattanooga, Minneapolis, Des Moines, Detroit, Columbus, Ohio

Channeldrain Roofing

For lifetime roofing service, apply Channeldrain, made of COP-R-LOY, the Copper Alloyed Steel, and thoroughly protected with a durable coating of pure zinc. Fire-proof, light-weight, and easy to install. Channeldrain offers maximum protection against leaks. Costs no more than ordinary roofing—worth a whole lot more to you because Channeldrain pays for itself through extra years of trouble-free service.

Wheeling

When writing advertisers please mention Pennsylvania Farmer

The general-purpose tractor works very well in this potato field where the rows are spaced 34 inches apart. The wheels are equipped with vine turners which protect the plants to perfection.

Agricultural Engineering

By R. U. BLASINGAME

THERE appears to be considerable discussion about row widths for field crops. We seem to have inherited the idea of planting corn in rows 42 inches apart and potatoes around 30 inches. I wrote to Mr. Ira Marshall, the world's champion corn grower, in Ohio, and he seems to think that corn rows can be 36 to 38 inches apart. In fact, he has made some of his big corn yields with rows less than 42 inches.

In view of the fact that general-purpose tractors are now being manufactured by five or six of the leading farm equipment manufacturers, and these tractors have proved to be a success in growing corn, oats, wheat, hay and potatoes, it appears some concession must be made in the width of rows for corn and potatoes. The wheels of these tractors can be adjusted to certain row widths; however, adjustments from 42 to 30-inch rows are considerably beyond the ability of some of them. Possibly if corn could be planted 38 inches apart it would be a more convenient shift in equipment down to 30 and 32-inch potato rows. This applies to horse-drawn equipment as well as to the general-purpose tractor.

Paint Sprayers

ON several occasions our readers have asked whether they could use potato and orchard sprayers for spraying paint on buildings.

I have taken this matter up with several of the sprayer manufacturers and they say that where their machine is equipped with an engine and will develop 300 pounds pressure the outfit can be used for whitewash and cold water paints.

They state that it will be necessary to employ a regular air compressor and special paint nozzle if oil paint is to be used.

When spraying whitewash or cold water paint the regular eight to ten-foot bamboo spray rod with a shut-off and nozzle will be satisfactory.

Care of Power Sprayers

A SPRAYER works under hard conditions. A little attention on the part of the operator to the most vital parts will greatly prolong the life of an outfit, and these suggestions are written to call attention to some parts which are frequently neglected.

Oil all moving parts at least twice a day. Be sure to keep oil in cylinders above plungers. Fill grease cups and see that they are never dry. Gears should be kept well greased.

It is important that spray material is not allowed to stand in the pump any length of time, hence it is well to plan the work so that the tank will be empty at night. If you can refill the tank without putting in spray solution or run enough water through to wash out the pump, hose and nozzle thoroughly, it will do a great deal to prevent destructive corrosion.

The oil in the engine ought to be changed at least every three days. At the same time you should take time enough to examine the whole machine carefully and see that no parts are loose. A spray pump works at a tremendous strain and a loose bolt or bearing might cause serious damage. The eccentricities must be kept tight and the connecting rods must be tight where they attach to the eccentric straps.

PANBREAKER

This is the companion tool to the cover crop disk shown in last week's paper. It can be run down to 12 or 15 inches deep without turning up clay. It follows the cover crop disk and is especially adapted to preparing loose seedbeds for potatoes. It will break up a "hard-pan" and pull out stones which are plow depth, if they are loose. It is taking the place of plowing in some sections.

Mr. Peaslee on Antiques

By FRANK K. RICH

"SUMMER'S about here," observed Deacon Hyne, watching a wagon loaded with ancient furniture slowly dragged along the dusty road; it was driven by a thin, fox-faced man who bent low over the dash-board and clucked incessantly to the horse. "Ephraim Gannet's got another load of broke-down furniture that'll be 'antiques' by the time the summer folks git here," he added. "It beats me, sometimes, to see how he manages to sell that stuff for the prices he does. He gits come up with once in awhile, though," Caleb grinned. "Seem 'sif luck works ag'in him sometimes, when he gits too graspin'."

Though the deacon did not speak, knowing it to be unnecessary, he looked up and Caleb answered the look.

"There's quite a number of things to keep in mind while I'm tellin' you this," he directed, "and one of 'em is that the hoss Gannet's drivin' now used to belong to Clem Brown; and Clem's wife is related to old lady Belknap; and Clem's wife takes boarders; and the summer boarders buy the heft of the things Gannet picks up to sell at big prices. You know all them things, but just don't forget 'em."

Almost Destitute

"Old lady Belknap," he went on, "belongs to one of them old families that used to have lots of prop'ty and big families, and now ain't got much left of either of 'em. I guess that old place and what housin'-stuff there is in it is about all that's left of a considerable big prop'ty. One thing sure, she never lays out a dime that she ain't sure of gittin' ten cents value—and I've seen her finger a quarter and countin' with her lips for five minutes b'fore she c'd spend it. Kind of pitiful, it is."

"If it wa'n't she needed money the bitterest way she'd never part with a stick of them old pieces of furniture, never in the world. But bein' the next door to destitute, when Gannet was up there one day and offered her fifteen dollars for that big side-board that has sot in the dining-room for seventy-five years I s'pose she must have figgered in her mind what that money would do for her, anyway, she said she'd think it over."

"When Gannet makes an offer of fifteen dollars for anything it means he's got a chance to get twice or three times that for it; and in this case it was that woman that a buildin' the big house on Marr's Hill. She wants all the real good old stuff she c'n git to furnish it. So she'd been to Gannet."

What Could He Say?

"Now this woman is boardin' at Clem's what time she's here, 'til her own house gits fur 'nough along to move into, and old lady Belknap drops in to Clem's once in awhile, to speak to Clem's wife, bein' a relation—I s'aid in the fu'st place."

"Wal, a couple of days after Gannet made his han'some offer, he'n that boy of his went along up to the Belknap place. The old lady was out; but the house was unlocked, so he went in. And not findin' her, he kind of took charge of things and without waitin' to find out what she'd made up her mind to do, he loaded the side-board on—and then, bein' as nosy as a fox, he went back into the house and went to pryin' 'round to see if he c'd light on somethin' else he c'd offer her little or nothin' for and make a good thing himself. And while he was doin' that, the hoss started and walked away, the wheels makin' no noise on the grass."

"Now here's where buyin' the hoss of Clem comes in; goin' off free, with nobody to rein it, there's where the hoss p'inted fer—and when he got there, out on the porch was Clem's wife, and the boarder—and old lady Belknap."

"Near 's I git it, the boarder wom-

an was the fust to see it when the hoss turned into the yard. She says: 'I do b'lieve Mr. Gannet's got my side-board I told him I wanted, and he's brought it here—but where is he, I wonder?'"

"And then Miss Belknap spoke up. 'I d'know where Gannet is,' she says, 'but I do know he ain't got your side-board; he's got mine; he offered me fifteen dollars for it, but I made up my mind not to sell; and I want to how it came to be on his wagon!' she says."

"When she said that the boarder woman like to fainted in her chair. 'Why,' s'she, 'he told me he'd have to git a hund'ud and twenty-five for it. What's the man thinkin' of?'"

"He was thinkin' of Gannet!" Miss Belknap snaps out. "But I won't sell that sideboard to him now if he offers me all he was callatin' to git for it—old robber!"

"That made the summer woman look kind of down-fallen for a minute, but she's one that gits her own way, I sh'd say, so she says: 'Look here! Will you sell it to me? That'll hurt him worse than anything you c'd do to him.' And after a little pleadin' Miss Belknap done it, and got the full price the woman was goin' to pay Gannet."

"And then, jest as the woman was payin' it over, and Clem and his hired man was unloadin' the side-board off'n the wagon, Gannet come footin' it along in a hurry."

"I wisht I c'd have been there," Caleb said wistfully. "It must have been well w'uth listenin' to. Gannet didn't get to say much, but Miss Belknap was threatenin' him with the law for enterin' her house and the summer woman was promisin' him to spread his prices around amongst her friends—so he got on his wagon and went away."

"Not that I figgered he c'd have found a gre't sight to say!" Caleb concluded happily.

Buddy Poppies

APPROXIMATELY 50,000 poppies are being made each week by the disabled ex-service men patients in U. S. Veterans' Hospitals throughout the country in preparation for the annual Buddy Poppy Sale of the Veterans' National Poppy Chairman of the organization.

"All the Buddy Poppies used in our national sale, held each year during the week of Memorial Day, are made by disabled and needy ex-service men," said Captain Handy. "The Veterans of Foreign Wars inaugurated this method of manufacture six years ago with the cooperation of the United States Veterans' Bureau, and the local Veterans' Hospitals are only two of a number of government hospitals throughout the country in which the Buddy Poppies are made each year."

"Buddy Poppy" is the name chosen by the men themselves and each flower carries a copyrighted label which guarantees it to the public. The entire proceeds of the sale, which last spring reached a national total of approximately 6,000,000, are devoted to welfare and relief work for ex-service men and their families, including an allotment to our National Home for Widows and Orphans of Ex-Service Men."

On Johnny's return to school after being away several weeks the teacher told him that he must bring a written excuse from one of his parents. The next day he presented this note from his mother:

Dear Teacher: Please excuse Johnny for being out of school for the last three weeks. He fell from a tree and broke his arm. By doing the same you will oblige, (Mrs.) Jennie Jones.

Pyrox Pays Better than Home-Mixed Sprays, Grower Says

IN comparative tests, hundreds of successful growers have proved that Pyrox is not only easier and safer to use than messy home-made bordeaux mixtures—but is also cheaper. Pyrox-protected potatoes pay extra cash from extra yields of better quality.

The experience of Mr. C. S. Newcomer of Chambersburg, Pa., is typical of the results obtained by Pyrox users. He writes:

"This season I made a test comparing Pyrox with home-made bordeaux. Seed, fertilization, cultivation and soil conditions were the same. However, my yield on Pyrox-sprayed plots was 385 bushels per acre, an increase of 70 bushels over the plots sprayed with home-made bordeaux which yielded only 315 bushels per acre."

"Pyrox is easy to use—I need but a few minutes to put the material in the spray tank and I am ready to spray. There is no nozzle trouble. Pyrox stays on the vines through hardest rains, and goes farther. Because of its soft, smooth, creamy fineness Pyrox will go through small holes in the nozzle disc resulting in greater ease in developing and maintaining pressure."

"My Pyrox-sprayed potatoes will show, at \$1.00 a bushel, at least \$70.00 more per acre. They are more uniform in size, smoother and cleaner in appearance than those sprayed with home-made bordeaux."—C. S. NEWCOMER.

Gets 15¢ to 20¢ per bu. Above Market Price

Mr. H. C. Rineard, of York, Pa., writes:

"I raise large acreages of corn, potatoes, wheat and hay so I must make all my labor count. That is one reason why I like Pyrox—because of its ease of preparation and application

Mr. C. S. Newcomer of Chambersburg, Pa.

as compared with home-made bordeaux.

"This is my second year using Pyrox and I certainly find that it gives me the control of insects and disease on my potatoes, and also improves the quality. I have been getting an increase of 100 bushels per acre, and an average of 15 to 20 cents per bushel better than the prevailing shipping price for my Pyrox-sprayed potatoes."—H. C. RINEARD & SON—November 6, 1929.

At \$1 a bu., Mr. Rineard's extra profit obtained with Pyrox amounted to \$100 per acre! And this is in addition to the extra price obtained per bushel.

Pyrox kills bugs, controls blights, and other diseases, and stimulates plant growth. It is quick and easy to use. Sprays in a fine mist—does not clog nozzles. Sticks like paint to plants, even through severe storms. Now lower priced than in 31 years.

Write us for facts which prove that you can actually cut your production costs—get more profit from your potatoes—by spraying with Pyrox. Please mention your potato acreage.

HAUCK WEED BURNERS

The modern, sure way to kill weeds. The Hauck—burns them green—kills and eradic. Easy, clean, quick, cost half of old methods. Used by suburban farmers, road commissioners, parks, country clubs, fruit growers, farmers, those who want a weed-free backlot.

Hauck Mfg. Co., 118 Tenth St., Brooklyn, N.Y.

Big team hitches are time and labor savers on many farms in the Middle West. E. T. Robbins of the University of Illinois has written a bulletin describing these hitches and showing their advantages.

The Story of Woodbine Farm

By W. D. ZINN

(Continued from last week.)

AFTER Mr. Agee had watched me a few days, he said: "Mr. Zinn, you will kill yourself if you continue as you have started. You must take more rest. Remember we are out for five weeks."

To which remark I replied: "Mr. Agee, I will be doing business after you have been laid on the shelf."

At that time Mr. Agee's health was not very good. We went on down through Tyler, Pleasants, Wood, Jackson and finally came to Roane county. One morning Mr. Agee came down from his room at a hotel in the town of Reedy and said: "Zinn, I am 'all in' and will have to go home."

"Not a bit of it, Mr. Agee," I remarked. "I will go up into Wirt and shake the bushes for the next four days and you stay here at this nice little hotel and rest until I return."

We had been having wonderful meetings everywhere and it was due in large part to his being advised to be there. I felt sure we were going to have even larger crowds down the river (which we did). I said I would call the meetings off if he did not go with me. He finally consented to rest. I went to Wirt and while the crowds were greatly disappointed, everywhere we had good meetings. On Saturday night I returned to Reedy and found Mr. Agee rested and in good trim. He continued so until we reached the end of our itinerary in Wayne county.

Mr. Agee held his audiences spell bound everywhere he went. It was on this trip I said to him: "I would rather be Alva Agee than Theodore Roosevelt." (Mr. Roosevelt was President at that time and I have always been a loyal Democrat.) Eternity will only tell the good that such men as Alva Agee have accomplished in the world.

I have but one very serious regret in thinking over my experiences in this field. I am sorry that I did not have the technical training that would have made it possible for me to do more efficient work and thus to render a greater service to the farmers and their families whom it has been my privilege to meet in these many years of institute work.

Contributor to Farm Paper

In the year 1900, by request of Alva Agee, I became an occasional contributor to The National Stockman and Farmer. A little later I was made one of its associate editors. By connection with this journal I have become acquainted with thousands of farmers, or rather, they have become acquainted with me. This, like most of my life work, has been very pleasant. One source of this pleasure has been the thousands of letters that have come to me from individual farmers. Of recent years, scarcely a letter comes that does not express the appreciation of the writer for the help I have given him. Here is a sample of many letters I have received. At the close of a two page letter in which several practical questions are asked, the writer closes as follows:

"Bro. Zinn:

"I enjoy reading your articles in The Stockman. In fact I usually turn to the 'Farm Practice' articles first. I am disappointed only when they fail to get your picture printed. Not that it's so very handsome, and yet I call it a handsome homely face, like Abraham Lincoln had. Now what tinner compliment could any American citizen wish? Well, jollity aside, I want you to know, and before you die, too, that a lot of folks whom you have never met in the flesh, appreciate your work. With all good wishes, in which Mrs. Brown joins with me, I am Truly,

N. L. Brown."

I once read of a certain king, whose subjects were wont to compliment and eulogize him. For fear he might become "puffed up" he employed a servant, whose business it was to walk behind him all during the day time, and continually whisper in his ear, "Thou art a man. Thou art a man." It has not been necessary for me to employ such a servant, for among many complimentary letters received there are a number of the other kind that take me to task for some things I have said. Thanks to those good friends. They save me from becoming vain and remind me that I am but a frail human being.

My newspaper work has brought a great deal of pleasure into my life. This has been true because my highest ambition in this work, as in all kinds of work, has been to render acceptable service. Indeed, I do not look forward with pleasure to the time when old age will force me to lay aside my pen. I remember hearing a good old deacon, a friend of mine, ask the Lord in his prayer to remove him from this "wilderness of woe" as soon as he saw fit. I thought at the time it was a very foolish thing with which to bother the Lord. For I felt sure He would do that when the time came anyway. One day this good man became very sick. He said to his son, "George, bring the doctor as soon as you can, for I cannot live another half day if I do not get relief." The doctor came, and soon gave him relief, and he was restored to his accustomed health. The deacon lost a splendid opportunity for leaving this wilderness of woe, but when the time came he was not half so anxious to go as his prayer indicated. He must have been joking with the Lord.

This is a good old world in which to live, and I would be willing to make a contract with the Lord to stay here a thousand years if it was His pleasure, provided He would make me useful. My life has been entirely different from what I planned it when a young man, but it is not for me to say that I would have accomplished more had I been able to have carried out my original plans. One regret of my life has been that I could not have been better prepared, since I have been offered such opportunities for service.

(To be continued.)

'Anything else, Sir?'
'No! what else could I want?'

WELL NOW what could he, anyway? Here he is in the Hamilton—Maddux Hotel. His room is furnished right up-to-the-minute. He has a spick and span private bath, white as can be. He has service a-la-speed. He is in an atmosphere of friendly individual courtesy. He has a spacious, beautiful lobby at his disposal. He knows that he is getting \$5.00 worth of comfort and luxury for only \$3.00 a day.

ADVERTISEMENTS

are short-cuts to finding out truths. The truths about everything you want to buy. The names in advertisements are names of solid reputation. The labels in advertisements are symbols of satisfaction. It pays to read the advertisements, for then you know what is good. The products they tell you about are being bought, tested constantly. The fact that they're still being advertised is alone proof of their worth.

A PROFITABLE TWIN

Find enclosed a picture of one of our Hampshire sheep. This sheep was a twin. Their mother died with pneumonia and they were fed on the bottle four and five times a day. Both are now living and doing well. The one shown here is "Mush." When she was a year old she dropped twins and clipped 16 pounds of wool. At two years of age she had triplets and clipped 12 pounds of wool.

Chas. F. Ampacher & Son,
Juniata county, Pa.

What Our Readers Say

Women Drivers

I WAS amused when I read in the March 8th issue where S. W. scores women drivers. I cannot recall having ever heard of a woman driver mixing up in a collision with a railroad train, while the papers are full of men trying to drive their high-powered autos over locomotives.

I have driven a car for twelve years. Have never run over anything except one chicken, and the only time I ever waited for help was when a man (road hog) crowded me off the highway and upset my car, pinning me beneath the steering wheel, where I was obliged to wait for help.

I can change a tire or patch a tube as quick and as well as any man can, so why wait for him?

I think S. W. was measuring the "cops" corn in his own half bushel when he said they could be "won over with a smile."

You are mistaken, S. W., all men are not built that way. Mrs. O. G. Marion county, W. Va.

Of course there are lots of jokes poked at the woman driver. Just like the Ford jokes.

But this poor soul who wrote your paper surely must take these jokes seriously. But the woman driver is here to stay.

I think your correspondent has been misinformed in regard to most traffic violators being women. From my experience I find most women very careful. That's why mostly men don't like women drivers; they obey the road signs; they seldom speed; they are too slow.

A case in mind, very recently we were coming along a hard road and were about to make a left-hand turn onto the ash road. My husband was driving and slowed down (our car has a stop signal). He put out his hand to designate his intention to turn, and was just letting out the clutch when "zlm!" a big car with a big red-faced fat man cut in in front of us. Another three seconds and we would have been his victims. He was going 50 if at all. I couldn't get his number.

About ten days ago we made that same turn. A car was right behind us—a woman driver with another woman and three little children. I looked back. She had pulled up back of us and slowed down. I said to my husband, "A woman driver and probably her own babies in there with her. She will take no chances."

Lots of men don't want their wives to learn to drive—mine didn't. Thought I was too excitable. But he had to go away and I had to know how in order to get to town. He taught me, and now he is as proud as

a peacock. Tells me how careful I am and that he doesn't worry a bit when I take the car out. My own husband decrees me a good driver!

I wish that man who wrote you would try teaching his own wife—if he has one. A Woman Driver.

Venango county, Pa.

A Woman with the Hoe

IN April 12th issue of Pennsylvania Farmer I noticed an article to which I take exception. On page 7 it relates "how and what a man can do with a wheel hoe." I would like to know, why not a woman with a wheel hoe?

I defy any man to push a wheel hoe with less energy, more pleasure, and a minimum of destruction than I, who have been eking out a living for the past 20 years by the wheel hoe method. I frankly believe that quite frequently a woman's so-called weakness comes from unused muscles. I have never spent a day in bed through sickness and I attribute my good health to my ability and desire to push a wheel hoe. True, there are times when I'm feeling bad, but from actual experience I find no quicker relief than to go to my garden and actually work it off.

I feel proud to get my tan in my garden. After being tossed on the ocean of life for forty odd years I find that white hand jobs are necessary but that for every white hand there is a black, toll-worn one—somewhere. The soft, white hand of a stranger is poor evidence of a useful life but the grimy, toll-worn hand is mute evidence of usefulness in some avenue of life.

Our sympathies are often misplaced. The most pathetic sight I ever experienced was while riding on a train. A supposed wealthy man sat opposite me alone. At a little station a grimy, hard-working man carrying a dinnerpail came in and sat along side the man of means. I compared the two and silently marveled why wealth and poverty were so unequally divided.

In the course of a few miles the working man alighted into the presence of four little tots who were anxiously awaiting by the track, while a fond wife and mother with a tiny babe in her arms stood in the doorway, greeting that husband and father with a smile. The look that followed him from the wealthy man I shall never forget. The aching void was pitiful to see. Since then I have a much higher regard for the toll-worn element of the world and feel oh, so sorry for the idle rich or for the class that find no pleasure in performing the real duties of life.

A Tiller of the Soil.

LEADCLAD ROOFS

A Thoroughbred Roof

A LEADCLAD ROOF is a thoroughbred—in a class by itself—as finely bred as any prize animal on your farm. It is a blue ribbon product.

A heavy coating of PURE LEAD is fused to copper-bearing steel by the exclusive LEADCLAD process. The result is a roofing that is easy to apply, extremely durable and economical.

A LEADCLAD Roof defies destruction by wind, rain, snow, fire and lightning. It will outlast any roofing you can buy. Down through the years it will serve you in a way that will make you wonder why every roof is not LEADCLAD.

"Ever Plow Up a Bullet?" is a booklet that you should read before you decide on material for your new roof. Send for a free copy

CRO-TOX

Bird and Rodent Repellent

The Guaranteed Protection Against Seed Pests

A few cents worth of prevention will save you dollars and days of cure. Cro-Tox at the insignificant cost of eight to ten cents an acre, will absolutely insure you from loss of seed corn, and loss of time and labor in replanting. It takes only a few minutes to treat seed corn with Cro-Tox before planting.

When so treated your corn is protected against damage by crows, pheasants, black-birds, squirrels, woodchucks, moles, gophers, wire worms, grubs and insect pests. Cro-Tox also prevents seed rot.

CRO-TOX IS NON-POISONOUS

It will not injure the corn. It will not kill birds or animals. It repels them. They will not touch seed treated with Cro-Tox. It is not necessary to dry seed treated with Cro-Tox, with lime or plaster. Cannot clog planter.

Cro-Tox is sold under an absolute money back guarantee, to do all that is claimed for it.

If your dealer cannot supply you, refuse substitutes and write us direct, enclosing \$1.00 per each bushel of seed corn you wish to treat. Sold by Seed, Drug and Hardware Stores.

Be sure to get the genuine, look for the name Cro-Tox.

Made by Bonide Chemical Co., Inc. Utica, N. Y.

Read the Advertisements

they keep you to the fore of modern life.

Through advertisements you've laid down the shovel and the hoe. You can buy a whole harvest ready-to-eat in cans. You've hung up the fiddle and the bow, for a radio. There's little old-time work left in this age of amazing short-cuts. Read the advertisements carefully and when answering them, say you saw their ad in Pennsylvania Farmer.

THE YOUNG PEOPLE

Insect Music Has Purpose

LIKE the troubadours of old, insects sing of love and war—but more often of love, explained Anna B. Comstock, emeritus professor of nature study, over Cornell University radio station.

The male mosquito is a harmless little fellow who keeps rather quiet. He is distinguished from the female by a large pair of feathery pompons on his head. These are antennae or feelers and on each segment are hairs; the longer hairs are on the antennae near the head and they are gradually shorter toward the top.

Professor A. M. Mayer cemented a male mosquito to a glass and observed him through a microscope while an assistant sounded tuning forks, varying in pitch. He found that a low-pitched note caused a whirl of the hairs nearest the head to vibrate; a note from a higher key caused the hair near the tip to vibrate. The range of the antennae extended over the middle and higher octaves of the piano.

The Female Mosquito Sings and Bites

It is unusual for the male to receive the song but in the case of the mosquito it is the female who does the singing and also the biting.

The chirp of the cricket is, in literature, usually associated with autumn; but the careful listener may hear him in the early summer, although his song is not so insistent then as later in the season. The male cricket is a manly and self-respecting troubadour and does not wander abroad to seek his love, but stands at his own gate and plays his fiddle lustily. He knows the shy lady is not far away and if she likes his song she will come to him when her heart is won.

Crickets Hear With Elbows

Each wing-cover of the male cricket is divided into membranous, disk-like spaces on top, and across each extends a vein covered with transverse ridges, the "file," on the inner edge, near the base, is a hardened portion called the scraper. When he chirps the cricket lifts his wing-covers and draws the scraper of one across the file of the other, and thus sets both in vibration. The cricket ear is placed conveniently in the tibia of the front leg, so that these insects literally hear with their elbows.

Then, there is the snowy tree-cricket, the mysterious musician of the late autumn. He can be heard but seldom seen in late September. His pallid green color makes him a ghost of an insect, rather than a real one. The "fiddle" is similar to the black chick's, but he is a true ventriloquist and it is almost impossible to find him by following the seeming direction of the song.

Orchestra Has Rhythm

So far as we know, the snowy tree-cricket is the only one of the insect musicians that seems conscious of the fact that he belongs to an orchestra. Their concert may begin in the late afternoon and continue until early in the morning. There may be discord at first, but as more players join the concert a rhythmic beat is established that is in as perfect time as if governed by the baton of a Damrosch. Flity and fortunately the song of this cricket is the most soothing of any of the songs of the insects. To listen to it consciously would make the most unfortunate victim of insomnia drowsy.

NEW BOOK OF GAMES

A BOOK of games that will prove a help in planning both indoor and outdoor social gatherings has been published by Eldridge Entertainment House, Franklin, Ohio. "Jolly Games and Fun Makers" by Raymond G. Bressler, Deputy Secretary of Agriculture, Pennsylvania, will be especially helpful in planning games or parties. The price is 75c.

WHY FATHERS GROW BALD
First Prize
By Barbara Ellen Shoemaker, Pennsylvania

It's Easy to Do

(Tune: "Sunny Side Up")
Keep your sunny side up—up!
Hide the side that gets blue,
If you are enjoying good health
It's worth more to you than your wealth.
Keep your funny side up—up!
Let your laughter come through—do!
Stand up tall and straight,
Never stay up late—
Keep your sunny side up!
Keep your sunny side up—up!
It is easy to do—
If you drink milk—each day a quart.
Eat fresh greens, just try every sort,
Keep the buttered side up—up
As your dark bread you chew—chew.
Cereals and fruit,
And your eggs to suit—
Keep your sunny side up!

The Youthful Cook

FROM the National Dairy Council we have the following suggestions for cottage cheese salads:
Tomatoes stuffed with cottage cheese;

"Cluck! Cluck! Cluck! Don't get your feet wet."

Four-H Dress Review for Girls

A THREE-WEEKS sight seeing trip to Paris and other points of interest in Europe during June, 1931, will be awarded the Four-H Style Queen selected in a National Four-H Club Girls' Style Dress Revue contest to be held during the Ninth Boys and Girls' Congress in Chicago, according to an announcement by the National Committee on Boys' and Girls' Club Work.

All clothing club members enrolled in Four-H Clubs in every county in the Union are eligible to compete in this contest. In addition to the grand prize, free trips to the National Four-H Club Congress, wrist watches and medals of honor are being offered by the Chicago Mail Order Company to county, state and reserve national champions.

Medals of Honor

Entrants in the contest will model in one dress of their own making in one of the following classes; cotton school dress, tailored wool dress, semi-tailored silk dress or informal party dress.

A silver oxidized and a bronze medal of honor will be awarded the county champion and near county champion, respectively, in all counties staging a Four-H style show in which there are ten or more contestants.

An educational trip to the Ninth National Four-H Club Congress to be held in Chicago, November 28 to December 5, 1930, will be offered as a prize to the winners selected in statewide Four-H Club Girls' Style Dress Revue contests to compete for national honors. In the national contest, the Four-H Style Queen and her state Four-H Club leader will be awarded the trip abroad. The three high scoring individuals in each class of the final contest will be awarded wrist watches.

Little Folks

Are You a Poet?

NO wonder poor Mother Hen is concerned about her babies! Any sensible chicken knows that a pond of water is more dangerous than a hawk. Who ever heard of a chick that wanted to swim?

Everybody likes to write poetry, so let's put on our poetry caps and write just four lines telling the story as the picture shows it.

Three book prizes will be given for the best four-line poem written by any boy or girl over twelve. Then if you are under twelve you may be one of the lucky ten who will receive a surprise prize for the best four-line poem. There is one requirement—be sure to state your age.

Just one week for this—so hurry! Send your letter to Young People's Editor, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

Just a Suggestion

MEMBERS of the St. Louis county, Minn., forestry clubs for the past two years have been selling pine knots for use as Christmas gifts. Last year they decided to make up an unusually attractive package, so in each box they placed a package of fairy-fire and on top of the pine knots, a wreath of balsam. With the assistance of Elizabeth Spietersbach, assistant county club agent, and Parker Anderson, state extension forester, an attractive mailing label was created to paste across the top of the box after it was packed. This label was 8½ by 11½ inches in size. The boxes sold for \$1.25 each.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1. Convention of twins! Photo shows twelve pairs of twins, forming a dancing chorus which will feature the program of the annual Convention of Twins at Long Beach, Calif. No singles or triplets will be allowed.

2. New York City.—Two-way telephone-television, a communication method by which persons participating in a telephone conversation see and talk directly to animated photographs of each other, was demonstrated by officers and engineers of the American Telephone and Telegraph Co. over a mile and a half of wires.

The conversations were conducted from specially designed sound-proof booths by apparatus that has been called the "ikonophone."

Each participant was confronted in the booth by a clear, speaking photograph in a 5x7 inch frame of the person with whom he was talking. The slightest variation in facial expression was transmitted instantly and was synchronized with the voice perfectly.

Photo shows Walter S. Gifford, president of the A. T. & T. Co. (left), ready for his first sight conversation, receiving the technical details from Dr. H. E. Ives.

3. Chicago.—Photograph shows the world's biggest building known as the Merchandise Mart in Chicago, which will house a city of wholesalers under one roof.

4. San Francisco, Calif.—Photo shows, left

to right Yoshiko Matsudaira, Keiko Nakamura, Kimiko Ashino, Yoshika Sato, and Suniko Tokuda, on their arrival here. They are from prominent Japanese families and are "Envoys of Gratitude, coming here to thank the U. S. for aid during the last tragic earthquake.

5. St. Louis, Mo.—Photo shows a rehabilitated covered wagon in the parade of the Oregon Trail Centennial which opened here—the spot where the historic trek began 100 years ago. The frame of this wagon is genuine—the wheels and a few other parts have been added.

6. Portsmouth, Eng.—Photo shows the queer stern and flight deck of H. M. S. Glorious, the large British cruiser which has been converted into England's latest aircraft carrier.

Get ready for summer milking the **EMPIRE MILKER**

**SAVES TIME WHEN
TIME COUNTS . . .**

\$8⁵⁰
a month

Why spend several hours a day, during the busiest season of the year, at the cow-barn chores? An Empire Milker will do the job better in half the time. Use that extra hour saved for profitable work in the fields.

Every Empire is backed by over 20 years' experience. Thoroughly dependable. Many up-to-the-minute and time-proven features. Milks right at every milking.

Don't put it off any longer. A small down payment and terms on some models as low as \$8.50 a month will put the Empire in your barn. A size for every herd.

Write today for full information.

D-759 SAFE KEEPER BULL PEN

Insurance Against Bulls

ALMOST every day we read where some person has been killed or crippled by a supposed gentle bull, and yet farmers continue to put their trust in such animals and take chances on being trampled or gored. Every bull is dangerous, no matter how quiet and gentle he may seem, and the only way to be safe is to consider every bull a potential killer and govern our actions accordingly.

There are three necessary things in the safe handling of a bull. One is a ring in his nose and a strong bull staff for leading him; another is a box stall or stanchion so strong that he cannot break it and so arranged that the bull can be fed and attended to without getting into the stall; and the third is an absolutely safe bull pen and exercise yard.

The bull pen and exercise yard shown in the diagram (D-759) is based on the plan recommended by Michigan State College, the bull pen being 11 feet by 15 feet and the exercise yard 20 feet by 50 feet. The fence must be strong enough that the bull cannot possibly break through, as one successful break makes him very difficult to hold afterward; and should be so constructed that he cannot get his head over, under, or through it. The bull should be able to see what is going on outside and get accustomed to people touching him, as he will be more contented and less likely to develop a bad disposition.

There are various ways of making the fence. One way is to set posts eight feet apart of reinforced concrete not less than five and preferably six inches square at the top and nine feet long, with the edges beveled. The fence usually consists of four two-inch used iron pipes, one being placed 12 inches from the ground, and the other three 15 inches apart, so that the top of the upper one will be about five feet six inches above the ground. In some cases the pipes are put through the posts, while in others the posts are notched on the inner side and clamped to the pipes with U-bolts.

Directions for making concrete posts can be secured from the Portland Cement Association, Chicago, Ill. If one prefers, he can use red cedar

posts eight inches in diameter and nine feet long, or creosoted posts of the same size. Where sound poles four to six inches in diameter are available, these are often bolted to the concrete or creosoted posts, and make a very satisfactory fence; or two-by-sixes may be used instead of the poles.

A very valuable safety device is to set a row of eight or ten straight heavy posts about the middle of the yard as shown with a shorter row at right angles. These should vary from 12 to 15 inches apart, so that a man can slip between them and escape from a maddened bull. Also it is well to hang in convenient locations some stout clubs about two feet long and heavy enough to knock a bull down. They are more effective than a pitchfork in stopping an angry bull, and not so likely to injure him permanently. Also it is desirable that the exercise yard be well drained to keep down the spring mud, which not only interferes with the bull's exercise but also with one's escape in time of danger.

I. W. Dickerson.

Cow-Testing Ass'n Report

Warren County

THE Warren County Cow-Testing Association finished its seventh year March 1, 1930, with 19 whole-year and four part-year members. There were 629 cows in the Association during all or part of the year.

The results for the seven years are as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1924 | 469.49 | 7636 | 245.5 |
| 1925 | 382.49 | 7061 | 248.6 |
| 1926 | 284.67 | 5828 | 240.3 |
| 1927 | 474.93 | 8207 | 314.9 |
| 1928 | 626.26 | 8229 | 318.9 |
| 1929 | 493.15 | 7973 | 297.6 |
| 1930 | 437.00 | 5158 | 298.7 |

A list of 300-lb. herds follows:

| Owners | Breed | Lbs. Milk | Lbs. Fat |
|--------------------|--------------|-----------|----------|
| G. G. Carter | G.H. | 10,524 | 391.9 |

Announcing the New "3,000,000" Golden Series De Laval CREAM SEPARATORS

**Combines
the Easiest Running
with the Cleanest
Skimming**

7 Improvements

These new De Laval Separators are unquestionably the crowning achievement in 52 years of separator manufacture and leadership. They are the finest cream separators in De Laval history. They combine the easiest running with the cleanest skimming, and the longest life with greatest convenience of handling. They are striking in beauty of design and finish, a satisfaction and pleasure to use and own. The new features, combined with such well-known De Laval features as the wonderful floating bowl, turnable supply can, durable, extra heavy tinware, oil window, perfect workmanship, etc., are:

1. **New trailing bowl discharge**, which reduces power required to operate the machine and also reduces frothing of the skim-milk;
2. **"V" shaped channels** on cream and skim-milk spouts guide streams straight;
3. **Ball bearings, properly protected**, make their separator use practical and afford still easier running;
4. **Worm wheel pinned to shaft** in way that permits worm wheel and spindle to align themselves and run easier and last longer;
5. **Improved oil overflow** insures used oil and sediment being automatically flushed out of the oil reservoir;
6. **Extended shaft with protecting cap** enables motor or power drive to be attached at any later time without taking the machine apart;
7. **New two-length crank** (on larger sizes) enables the machine to be quickly brought to speed with crank in the long position, then a turn of the wrist, without slackening the turning, and the crank is shortened, which enables speed to be maintained with the least effort.

These new De Laval must be seen and tried to be appreciated. Your De Laval dealer will gladly let you see and try them. If you do not know the name of your dealer, write nearest office below for full information.

The Start of a Corn Crop

By L. W. LIGHTY

FARMERS are plowing, harrowing, planting and a goodly number have tested their seed corn and are sure it will sprout. A few who have had sad experience with the crows pulling the corn are using a repellent so the birds will leave it alone. The great majority know that a real fine loose seedbed with a shallow covering of the grain also will help in assuring a good stand. And all of us who know anything know with absolute assurance if we have a poor stand of corn we cannot expect a full crop.

Getting a good stand, not too thick nor too thin, of thrifty plants in the corn field is much more than half the battle in growing a full corn crop. This part accomplished the next proposition is to have the field completely free from weeds until the plants have grown beyond the cultivating stage. Some years this is easy enough, but often after corn planting we have a long rainy spell and we cannot get into the field with the harrow and weeder in good time to destroy the weeds when very small.

I have found it wise to do all possible with the tilling implements and then finish out with the hoe so when we are over the field it is completely free from weeds. Then the following cultivations are easy and weeds make little trouble.

An inquirer wishes to know about fertilizer for corn. Corn grows rapidly and must have an abundance of available food at hand. Stable manure spread on the sod during the winter is of course excellent, but on the average soil it pays handsomely to use a complete fertilizer. Applying this over the entire area I found greatly preferable in dry years, but in years of plenty of rain there was no difference between the part where the fertilizer was put in the row or distributed over the entire area.

Of course we all know after we have done our part well in the fore part of the season the making of the corn crop is in the clutches of the weather, however, the man who has the best stand on a fine fertile area by the fourth of July may outlive fairly bad weather, but the fellow who has weeds and clods and infertile soil and an irregular stand need never think of building a new corn crib.

Dairy Rations

An unsigned letter says: "Will you tell me something about the best dairy ration?"

Well, here are some of the ingredients of the best dairy ration. It should be fairly well balanced with a number of grains and by-products so it will furnish the needs of the cow, and there should be an abundance of roughage. All of these feeds should be reasonably palatable. If the feed lacks in palatability the cow will not consume enough and the more feed the right kind of a cow will consume the more profit she can make.

Then you must consider the physical effects of the feeds. A feed may be injurious to the cow or the product and that should not enter into the ration. While the above ingredients are of vital importance the one that is of still greater importance is the cost of the ration.

If the ration costs too much the chances are slim at this time for any profit. Many farmers are growing crops that are unprofitable. How would it be to utilize some of those unprofitable acres by growing alfalfa, soy-bean hay and grain for the cows? Are you growing all the corn and oats you can for the cows?

When the surplus beats down the prices of the dairy products the only remedy we have is to beat down the cost of production. Many of us can beat down the cost of production by growing more and better ingredients of the ration.

Pasture Again

Bringing the same old temptations and dangers it brought last year and will bring next. You know what they are—so do thousands of other dairymen. Yet every year thousands of dairymen make the same old mistake.

Grass looks good to you and your cows and you turn the herd out too early. Result—young grass trampled so badly it won't be any good all summer; cows getting water instead of real feed because their grain allowance has been reduced; cows going into a milk slump in July and August when a little more grain would have carried them safely through to the fall.

Be sensible about pasture time. Pasture is great stuff if you use it the right way—the only way—and that's with a simple, low-protein grain ration that will supply the nutrients needed by the cow but lacking in grass. Let

DIAMOND CORN GLUTEN MEAL

form the basis of your grain mix this summer. Bran and ground oats will do the rest—maybe a little oil meal too. This is economical feeding—safe feeding—feeding that will keep your herd healthy and happy and producing steadily and well Want formulas and directions? Ask us. They're free.

What Does AUTOMATIC Milker Mean?

AUTOMATIC means self-acting. That's why the Perfection Automatic Milker was so named. It is self-acting. It instantly adjusts itself to the milking needs of the individual cow.

The cow's milk flow automatically regulates the action of the milker. If a cow milks easily, the amount of suction applied by the Perfection Automatic Milker is reduced and the sucks are longer. If she is a hard milker, it increases the suction—in shorter sucks. As a result, your cows are not all subjected to the same amount of suction in milking.

Like the sucking of the baby calf, the Perfection Automatic Milker varies the length and strength of its suction to suit the individual cow. This automatic regulation is an exclusive Perfection feature.

LIVESTOCK

PITTSBURGH Cattle

Receipts continue light, only 40 carloads arriving for Monday's trade. Demand was anything but urgent, buyers bidding lower and also buying cheaper must classes of steers. Good fat weighty steers were steady, but the ordinary and pretty good light and handy-weight steers looked low. Choice fat steers with weight brought \$12.25@12.50, with good weighty kind around \$12 and plainer sort around \$11.50. A few choice handy-weight steers brought \$12.25, but good butcher steers could be had at \$11.25@11.50 and useful killers around \$11. Fair light and handy steers brought \$10.50@10.75 and ordinary kind around \$10, common on down to \$9. One load of yearling steers needing more finish sold at \$11.25. Heifers were few, one prime baby beef heifer going at \$11.50 and the best of the others \$10.50@10.75. Fat cows were rather slow, a few selling at \$8.50@8.75, not many good enough to go above \$8. Canners sold at \$4.75@5.25, largely \$5@5.25. Bulls were steady, with best handy weights \$8.75@9. A few buyers for steers to graze were on hand but few cattle suitable for this purpose, held at \$10@11 per cwt.

Hogs

Monday's receipts were light, 22 double-deck carloads, but the demand was not broad and prices showed little change from last week's close. Sorted handy-weights brought \$10.75 largely, mixed selling up to \$10.70 but mainly \$10.50@10.65. Heavy hogs went at \$10.25@10.40, the heavier the cheaper. Pigs and light Yorkers brought \$10.25 largely. Sows were all wanted at \$8.75@9.

Sheep and Lambs

Monday's supply was about 15 double-deck carloads, one-third of them consisting of sheep. The quality of the sheep was mainly good. Best wethers went at \$5.25 in a big way. One bunch sold at

\$5.40, but it took good ones to command \$5.25. Clipped lambs of good finish were firm at \$9.25, with culls at \$7 on down as rule, a few good culls \$7.50. Common clipped lambs sold down to \$5 per cwt. Spring lambs were about steady at a range of \$10@14 per cwt. Receipts are not large but are increasing, and a good-sized lamb crop is expected in this territory.

Clipped

| | |
|----------------------|-------------|
| Good to best wethers | \$5 00@5 25 |
| Good mixed | 4 50@4 75 |
| Fair to good, do. | 4 00@4 25 |
| Common to fair | 3 00@3 25 |
| Interior sheep | 2 00@2 25 |
| Good to best lambs | 9 00@9 25 |
| Medium lambs | 7 75@8 25 |
| Culls and common | 5 00@5 25 |
| Spring lambs | 10 00@11 00 |

Calves

About 1,100 calves appeared for Monday's market, an ample supply. Prices were lower at \$11 per cwt. for best calves, \$7.50@8.50 for seconds and \$5@6 for common.

CHICAGO Cattle

Chicago, April 28.—Cattle receipts amounted to 24,000 head. The market was 25¢ lower with top at \$14.75. Choice steers, 1,200 lbs. or over \$12.00@12.25. Common to fair steers \$11.75@12.00. Fair to good, do. \$11.00@11.25. Plain heavy steers \$11.00@11.25. Choice handy-weight steers \$10.00@10.25. Good butcher steers, 1,000 to 1,150 lbs. \$11.50@11.75. Fair to good, do. \$11.00@11.50. Ordinary to fair, do. \$10.25@10.75. Common, do. \$9.50@10.00. Good light butchers \$11.25@11.50. Common to medium, do. \$10.75@11.25. Fair to good light steers \$10.00@10.50. Common to medium, do. \$9.50@10.00. Feeder light steers \$8.50@9.00. Feeder heavy steers \$8.00@8.50. Stockers \$8.00@8.50. Choice fat heifers \$10.00@10.50. Good to choice heifers \$9.00@9.50. Fair to good heifers \$8.00@8.50. Common to fair heifers \$7.50@8.00. Choice fat cows \$11.50@12.00. Good to choice fat cows \$7.50@8.00. Fair to good cows \$6.50@7.00. Common to fair cows \$5.50@6.00. Canners \$4.75@5.25. Fresh cows, calf at side \$50.00@55.00. Choice heavy bulls \$8.50@9.00. Choice handy butcher bulls \$8.75@9.00. Good handy bulls \$8.00@8.50. Fair to good bulls \$7.50@8.00. Common to fair bulls \$7.25@7.50. Interior bulls \$6.00@6.50.

Hogs

About 40,000 hogs were on hand, including 15,000 "directs." The market was steady to a dime higher. Top hogs brought \$10.20; bulk \$9.65@10.15. Top pigs, 140-160 lbs. \$9.00@9.75. Underweights, 140-160 lbs. \$9.00@10.15. Light, 160-180 lbs. \$9.50@10.20. Medium butchers, 200-250 lbs. \$9.50@10.20. Heavy butchers, 260 lbs. up. \$9.50@9.90. Stags, 70 lbs. dock. \$8.35@9.25.

Sheep

With 24,000 sheep and lambs on sale the market was steady to a quarter lower. Best lambs went at \$9.85. Native lambs \$6.00@8.35. Western lambs \$7.50@8.85. Feeding lambs \$7.50@8.75. Wethers \$5.00@6.75. Yearlings \$5.25@6.00. Ewes \$3.75@5.75.

LANCASTER Cattle

Lancaster, April 28.—Five hundred head of cattle made up the supply. The market was very dull lower, the bulk selling at \$11@11.75. Bulls and she-stock steady to weak; stockers and feeders nominal. A hundred and fifty calves were offered.

ROOMS, 25¢@30¢ per pt. box. ONIONS, 20¢@25¢ ¼ pk. ONIONS, (green), 8¢@10¢ bunch. POTATOES (old) 15¢@20¢, (new) 25¢@30¢ ¼ pk. (old), \$1.45@1.50 bu. POTATOES (sweet) 25¢@30¢ ¼ pk. PEPPERS, 5¢@8¢ ea. PITTSBURGH

Butter.—Nearby tubs, 92 score extras and standards, 38½¢; 89 score, 37¢; 88 score, 36¢. Prints 1¢ higher. Eggs.—Nearby firsts, second-hand cases, 24¢@24½¢; extra firsts, new cases, 25¢@25½¢; nearby henner white and browns, 26¢@26½¢. Poultry.—Live hens, heavy, 27¢@28¢; mediums, 27¢@28¢; Leghorns, 23¢@25¢; broilers, 35¢@40¢; Leghorns, 23¢@25¢; old roosters, 16¢; geese, 16¢; ducks, 20¢@25¢; pi-geons, 35¢@45¢ per pair; turkeys, 20¢@25¢. Fruit.—APPLES, barrel, N. Y., unclassified 2½-in. Russets, \$4 bu. basket; N. Y. U. S. No. 1, 2½-in. Baldwins, \$2@2.25; 48s, 50s (¼-blood) strictly combining \$1.90@2.15. CUCUMBERS, Ohio, box 2 doz., fancy, \$2.75@3. KALE, Md., bu. basket, 65¢@75¢. LETTUCE, Ohio, house, 10-lb. basket, best, \$1.60@1.75. MUSHROOMS, Penn'a 2-lb. basket, \$1.60@1.75. ONIONS, 50-lb. sack, Ohio yellows, 50¢@75¢. POTATOES, U. S. No. 1, Maine Green Mts., 120-lb. sack, \$3.65@3.85. RHUBARB, Mich. house, 5-lb. cartons, 90¢@\$1; choice, 40¢@50¢. SPINACH, Md., bu. basket, 75¢@85¢.

The market was weak to 50¢ lower. Best veals went at \$12 with a few extra at \$14.50. Good steers \$12 00@12 50
Small sales were closed on 568 strictly combining fleeces with values inclined lower. A slight decline was shown on 48s, 50s on a very small volume of trading. Some business was done on steady and burry wools of the 56s and 48s, 50s grades. Also, small lots of wools were offered to be available in the country at prices which would permit figures lower than prices for which spot offerings of graded wools are held. Low wools were quiet with these grades nominally quoted slightly lower. Business in Territory wools consisted chiefly of 64s or finer and 58s, 60s wools. Original bag 64s and finer wools of bulk French combing staple sold at 70¢@72¢, secured basis. Graded French combing moved at 70¢@72¢ secured basis. Some choice lines were held at slightly higher figures than these ranges. Graded strictly combining 58s, 60s sold at 70¢@72¢ secured basis. Sales were moderate to small in quantity. The selection of old wools, also, is poor which has had some influence in lowering prices. Wools of 56s and 48s, 50s qualities were slightly easier although little business was closed. The slow demand from the knitting trade has tended to weaken the medium grades. A little buying is reported both in the West and in the bright-wool states. Some fine and fine medium Utah wools has sold at 21c, a Nevada clip went at 16¢@18¢ and in Idaho a fair movement is reported at 15¢@16¢. Some Ohio wool has been sold, bringing about 20¢ to the grower for medium and 15¢@18¢ for fine wools.

WOOL MARKET

Boston, April 26.—Trading in wool during the past week has been light, says the U. S. Department of Agriculture, Market News Service. Manufacturers bought some moderate quantities, but bids were mostly lower than during the previous week and sales were closed at slightly lower figures than were quoted a week ago. Dealers are strongly resisting pressure for lower prices and as the week closes there seems to be a firm undertone in the sentiment. Fleece wools are quiet and quotations were easier. No business was reported on any class of 64s or finer qualities. Inquiries were received on 58s, 60s but sales of any consequence failed to materialize. Small sales were closed on 56s strictly combining fleeces with values inclined lower. A slight decline was shown on 48s, 50s on a very small volume of trading. Some business was done on steady and burry wools of the 56s and 48s, 50s grades. Also, small lots of wools were offered to be available in the country at prices which would permit figures lower than prices for which spot offerings of graded wools are held. Low wools were quiet with these grades nominally quoted slightly lower. Business in Territory wools consisted chiefly of 64s or finer and 58s, 60s wools. Original bag 64s and finer wools of bulk French combing staple sold at 70¢@72¢, secured basis. Graded French combing moved at 70¢@72¢ secured basis. Some choice lines were held at slightly higher figures than these ranges. Graded strictly combining 58s, 60s sold at 70¢@72¢ secured basis. Sales were moderate to small in quantity. The selection of old wools, also, is poor which has had some influence in lowering prices. Wools of 56s and 48s, 50s qualities were slightly easier although little business was closed. The slow demand from the knitting trade has tended to weaken the medium grades. A little buying is reported both in the West and in the bright-wool states. Some fine and fine medium Utah wools has sold at 21c, a Nevada clip went at 16¢@18¢ and in Idaho a fair movement is reported at 15¢@16¢. Some Ohio wool has been sold, bringing about 20¢ to the grower for medium and 15¢@18¢ for fine wools.

CATTLE TRADE BETTER

The cattle market made the best showing this week in some time even though receipts at 40,700 were 6,000 larger than last week. The big gain was on tops, \$15.15 being paid for some heavy cattle. The highest price for the same week since 1920. However, this was out of line with the market in general and was due entirely to the extreme scarcity of finished heavy cattle. Best yearlings brought \$14.20, the highest since 1920. Average price highest in some time. Average price for the week at \$12 compared with \$11.85 last week, \$13.75 a year ago and \$13.05 two years ago.

CHICAGO CASH GRAIN

Chicago, Ill., April 28.—The following cash prices ruled here today: No. 4 hard wheat, \$1.60@1.64; No. 3 yellow corn, 79¢@80¢; No. 3 white corn, \$1.61@1.64; No. 2 white oats, 41¢@42¢.

Lambs a Little Higher

The trend in the lamb market was downward this week though prices were a little higher than last week. Average price this week was \$9.45 against \$9.10 last week and \$16.40 a year ago. Receipts were smaller—88,600 this week against 98,000 last week. There was a big decrease in Colorado lambs, from 71,000 last week to 40,000 this week; but a big gain in California springers, from 3,000 last week to 16,000 this week.

Top woolled lambs hang right at \$10.

By Lee

Farmer's Business Letter

BUSINESS reports this week are a little more favorable though there are still plenty of bad spots. Figures of production and trade are subjected to close scrutiny, such is the eagerness to detect signs of the upturn. If it were possible to take a cross-section of sentiment it would probably be found that confidence had gained somewhat.

Depression abroad is indicated by the decrease in export trade. For the first quarter of this year the value of exports from this country declined \$385,000,000. This decrease has an effect out of proportion to its size, because it means that so much more must be sold in a domestic market already somewhat depressed.

The condition of business has an important bearing on farm product prices. No one at this time seems to expect better than slow gains in business.

Grains Lower

The grain market continues weak, with prices sagging steadily. Export sales of wheat picked up for a day or two, putting a little heat into the trade, but it dropped right off. May wheat at \$10.2 dropped to a new low for the crop season, and this in spite of continued unfavorable reports from Kansas and Oklahoma. On the other hand, India reported a crop of 370,000,000 bushels, an increase of 51,000,000 over last year.

The Stabilization Corporation owns about 31,000,000 bushels of cash wheat and is long about 19,000,000 bushels of the May future, according to a statement issued by Chairman A. A. Legge of the Farm Board. The figures, while large, occasioned little comment, as they were about in line with recent trade estimates.

Weather has continued favorable to the preparation of corn ground. Some planting has been done in the southern half of the corn belt. It has been cool this week, but if it should turn warm a lot of planting will be done next week.

Cattle Trade Better

The cattle market made the best showing this week in some time even though receipts at 40,700 were 6,000 larger than last week. The big gain was on tops, \$15.15 being paid for some heavy cattle. The highest price for the same week since 1920. However, this was out of line with the market in general and was due entirely to the extreme scarcity of finished heavy cattle. Best yearlings brought \$14.20, the highest since 1920. Average price highest in some time. Average price for the week at \$12 compared with \$11.85 last week, \$13.75 a year ago and \$13.05 two years ago.

Consumption of Meat

A slight decrease in total meat production and consumption in the United States last year as compared with 1928 is shown in a government report, which places total production of dressed meat, not including lard, at 16,803,000,000 pounds in 1929 as compared with 16,995,000,000 pounds in 1928.

Produce Market Review

THE Philadelphia egg market showed a weaker tendency at the opening of the week with prices declining slightly. Trading slowed off as buyers had purchased more than their holiday requirements. Fairly liberal arrivals and offerings of nearby eggs combined with pressure to sell result-

ed in additional declines as the week progressed. Supplies accumulated despite the fact that receivers of prices were willing to push sales. Prices apparently did not enter into the situation greatly as the trade was merely off the market and refused to operate beyond their most urgent needs.

The New York egg market was steady during the latter part of the week. Fancy brown eggs were firmer, but nearby white eggs were rather quiet. There were 7,100 cases of eggs exported to Argentina from the port of New York and this helped the market. Prices of 92 score butter dropped a full cent during the week. Shipments of old potatoes dropped off during the week and the movement of new stock from Florida and Texas was of moderate volume. The early crop in Florida has been showing advanced yields and the best stock has advanced about \$1 per barrel. This has been a help to holders of old crop potatoes. Both Maine and Pennsylvania stock sold mostly at \$3@3.25 per 100-pound sack.

Apples Quiet

Apple markets were quiet although prices of good stock held firm. The shipments are decreasing and are now averaging around 100 cars daily. A few scattering shipments of Pennsylvania stock are moving but about one-fourth of the total movement is from New York state.

FEED MARKET

The following quotations are for transit and nearby shipment April 25, according to the U. S. Bureau of Agricultural Economics. They show the approximate cost of feed per ton (all in 100-lb. sacks) and grain per bushel in carlots arrival draft basis delivered on track at Philadelphia and Scranton rate points: Bran, \$36@37.50; standard middlings, \$35.50; flour middlings, \$37; cottonseed meal, 43 per cent, \$49; gluten feed, \$37.50; No. 2 white oats, 54¢; No. 2 yellow corn, 51¢.

Butter Unsettled

Butter markets were unsettled during the week. Trading was quiet, with buyers confining their purchases to most urgent needs. Prices tended lower with most receivers making an effort to keep their stocks at the lowest possible level. Receipts of butter at the eastern markets were larger than during the previous week and this was the chief cause of the unsettled condition. Prices of 92 score butter dropped a full cent during the week. Shipments of old potatoes dropped off during the week and the movement of new stock from Florida and Texas was of moderate volume. The early crop in Florida has been showing advanced yields and the best stock has advanced about \$1 per barrel. This has been a help to holders of old crop potatoes. Both Maine and Pennsylvania stock sold mostly at \$3@3.25 per 100-pound sack.

Apples Quiet

Apple markets were quiet although prices of good stock held firm. The shipments are decreasing and are now averaging around 100 cars daily. A few scattering shipments of Pennsylvania stock are moving but about one-fourth of the total movement is from New York state.

Harold Graybill of the Dauphin County (Pa.) Calf Club and the Holstein heifer with which he won in the club contest at this past winter's State Farm Products Show.

ed in additional declines as the week progressed. Supplies accumulated despite the fact that receivers of prices were willing to push sales. Prices apparently did not enter into the situation greatly as the trade was merely off the market and refused to operate beyond their most urgent needs.

Butter Unsettled

Butter markets were unsettled during the week. Trading was quiet, with buyers confining their purchases to most urgent needs. Prices tended lower with most receivers making an effort to keep their stocks at the lowest possible level. Receipts of butter at the eastern markets were larger than during the previous week and this was the chief cause of the unsett

There's no reason
why every farm
home shouldn't
have the

**NEW
MAYTAG**

POWERED by electric motor or gasoline multi-motor, representing the greatest value and serviceability of any washer, there is no reason why every farm home shouldn't have a **NEW Maytag**. Its reasonable price is eventually offset by the saving in clothes. The hours saved each washday may be spent in other profitable ways. Divided payments make the purchase easy.

Investigate the washer that is preferred by farm homes everywhere. The **NEW Maytag** one-piece, cast-aluminum tub holds four gallons more than ordinary washers. The **NEW** roller water remover has an enclosed, positive-action, automatic drain. The **NEW** quiet, lifetime, oil-packed drive needs no oiling, no adjustment. The **NEW** handy, auto-type shift-lever for starting and stopping the water action, is easily operated from any side of the tub.

Farm homes, especially, need the **NEW Maytag**... the greatest achievement of the world's largest washer factory.

The Gasoline Multi-Motor

Built by Maytag, exclusively for the Maytag, the Multi-Motor is the finest washer engine made. It represents sixteen years development. A step on the pedal starts it... only four working parts... flood-proof carburetor, bronze bearings, Bosch high-tension magneto and speed governor... interchangeable with the electric motor by removing only four bolts.

THE MAYTAG COMPANY, Newton, Iowa

Permanent Philadelphia Factory Branch,
Maytag Building, 851-3 North Broad St.,
Philadelphia, Pa.

Branches, Distributors or Representatives in London, Berlin, Hamburg, Geneva, Genoa, Oslo, Sydney, Melbourne, Adelaide, Wellington, Buenos Aires and other principal cities.

A week's washing
FREE

Write or phone the nearest dealer for a Maytag. Let it do a big washing for you. It will take but an hour or two and you will be surprised at its thoroughness and convenience. If it doesn't sell itself, don't keep it. Divided payments you'll never miss.

Maytag
Aluminum Washer

A \$4,500,000 PRODUCT

Power Churn Attachment

THE Maytag churn attachment is an aluminum churn of 3 gallons churning capacity. It sets over the agitator post and utilizes the same power that washes the clothes. Water in the washer tub keeps the cream at the proper churning temperature. Easily cleaned, durable and a time and labor saver.

Power Meat Grinder Attachment

By simply lifting off the Roller Water Remover, this New Meat Grinder Attachment may be set over the shaft head of the power leg. Grinds sausage, mince meat, chops nuts, raisins, fruit, relish, etc. Saves time and labor. The churn and meat grinder attachments are extra Maytag equipment, sold at reasonable prices.

A Healthy Crop of Potatoes Made CERTAIN by Niagara Dusts and Dusters

NO more worrying or trusting to Lady Luck! Scientific crop protection has arrived with Niagara—scientific because it has been tested again and again in actual practice and found thoroughly successful. Now when you use Niagara dusts and dusters on your potatoes, you utilize a method which has the endorsement of some of the nation's best known growers.

It's a simple operation to protect your potato crop the Niagara way! The whole procedure can be accomplished quickly (Niagara dusters are super-efficient, you know) with a saving of hours of your time. No water is needed, of course, and very light-weight equipment is used. Look into the advantages Niagara Dusts and Dusters can give you . . . Niagara Copotex, a powerful insecticide, kills bugs without injuring foliage; Niagara Copodust is a disease preventive that can't harm the plants. Dri-Fog Dusters are solidly built after improved designs. They are light in weight, and special dusting mechanism and nozzles give thorough, economical distribution of dust, as well as complete coverage of foliage.

You're not satisfied with "half-way" crops.

Write for full particulars on potato dusting.
NIAGARA SPRAYER AND CHEMICAL COMPANY, Inc.

Farm Facts and Fancies

By ALVA AGEE

THERE was a time when the sheep was about the only political member of the farm products family, being concerned chiefly with the tariff. Now that farming interests are politically minded, as they should be, I wonder what will be their relative power in the Congress elected after state representation in it has been reapportioned on the basis of the census just taken. We have been doing business on the basis of the census taken twenty years ago.

Of course the Constitution provides for reapportionment after every decennial census, but no Congress since the census taken in 1920 was willing to tackle the job. It would have meant cutting down the number of representatives from many rural states and increasing those from industrial states. Within the states it would have meant giving more members to big cities and cutting down country districts. Much more important to some, it meant losing their jobs.

Reduced Political Power

Ten years more have made matters worse from the farmers' viewpoint. Cities and industrial states have grown rapidly, and the farming population nearly everywhere has dwindled as machinery on the farm has replaced human labor. Reapportionment will come this time because the Congress decided two years ago to obey the Constitution when the figures for this census became available.

Rural sections of many states will lose representatives as cities within their borders gain, and our farming states will lose to the industrial states that have gained rapidly in population. It is a safe guess, probably, that the number of members of the lower branch of the Congress that will feel dependent on the approval of farmers will be one-fourth less than it is today.

This readjustment affects us another way. The conventions that name candidates for President and make platforms are composed of delegates whose number is proportionate to congressional representation. Farming states will have a smaller voice in naming candidates and they will have less effect on the electoral vote as a result of this new count of our population. The census of 1930 is going to give us something to think about.

"You Write It"

A thoughtful reader points out that something is woefully wrong in the world when a part of the people has more wheat and other stuff than it can sell and another part of the people, numbering millions, is starving for food. He believes that this country would be better off if the surplus were given to these starving Orientals, and yet fears that the suggestion would be rated as childish. He closes his letter by saying: "You write it, I can't." Neither can I write it in a way that would not bring jeering. We are too immersed in our materialistic philosophy of life to see things in the world as they would appear to one looking on from the outside.

China's Plight

We must grant the difficulties. Every people must work out its own destiny in great measure and rise largely through its own struggles, and those who do not want to feel responsibility say this with a smug satisfaction. I am told that much of China's present hunger is the direct result of failure in government. While we attribute that failure to lack of much true national spirit in that country, western Europe has not treated the country well, reducing its chances of coming along and of gaining control of itself.

Its concessions there darken China's future by taking from national authority. They directly affect only a

minor part of the population, but they darken the horizon because the Orientals must work up along the way that the Oriental mind believes is good. China would be in a different plight today if the Christian nations of the world had shown Christian qualities in their contact with her.

If we have the superior mind and business ability that we credit ourselves with, we cannot go along blameless when millions starve and we have wheat we cannot sell. The Orientals should be eating our surplus bread and we should be getting a fair price for what is eaten elsewhere. What is a workable plan? I do not know, but it would be good for us in every way if we could find it and use it. The presence of millions of starving human beings in our world is an indictment of civilization.

Trend of Land Prices

A reader asks what my judgment is regarding the trend of land prices. Every one has a right to his guess. A study of government figures and reports from banks indicates that prices of farms have struck bottom for this time. Forced selling has decreased and payments are being made on mortgages. The normal thing is that after such a depression as followed the war we go up-grade. Pretty dependable men believe that there are many farm bargains for that reason.

The better purely commercial bargains are where the people do not add materially to price for "home" value, as is done in some of the older sections of the country. The home value is there all right but it does not pay cash dividends, and the question facing one proposing to go heavily into debt for a farm, as this reader is half inclined to do, is whether he can pay out when price is considerably higher than that account.

The Potato Farming Outlook

The same reader asks whether I think potato farming will remain as profitable in the future as the average of recent years. I dare not try to say. As far as general industrial conditions go, I feel tolerably sure that the slump in business that started the latter half of last year is not the beginning of a series of years of hard times. We should gradually find ourselves coming back into a state of industrial prosperity.

It looks like we shall have a continuing surplus of grain and meat as farm machinery and fertilizers come more into use in the central states, and nobody knows how much this may influence the acreage of potatoes. It probably will increase. The southern states incline more and more to fill the summer markets, and that influences price when the northern crop comes to market. The heavy fertilization of potatoes is raising the average production per acre.

It seems likely that farmers who stick to old and somewhat careless methods, neglecting seed selection and spraying, are going to lose out while skillful growers will continue to make money. But the potato is a willful vegetable and one never knows what it will do.

New Zealand Spinach

THIS vegetable is not a true spinach. Botanically the plants are not closely related, but New Zealand spinach has the same uses as common spinach, and some people like it better.

It has one advantage over common spinach in that it does not bolt to seed in hot weather. It does make some seed, as a matter of fact, but continues to produce leaves for green at the same time. The seed is slow to germinate and should be soaked forty-eight hours before it is planted.

Space wide, at least fifteen inches between plants, as it is a rampant grower. N. Y. College of Agr.

A WELL-KEPT hedge serves the dual purpose of ornamental shrubbery and fence. It makes a dense growth and must be trimmed back now and then to keep it within reasonable bounds.

The picture above shows how a hedge can be cut back and leave a straight and even topline. Stretch a wire or cord along the side about the height wanted and trimming will be an easy job. Luke W. Martin. Lancaster county, Pa.

Retired, But Not Tired Farmer

SOME years back I realized that my wife and I could no longer carry on the active work of a 160-acre farm. About the same time I found out that our plan to retire and live in town, turning over the farm on share to my son, would not provide enough money for us to have the things to which we had been accustomed. So putting our wits to work we bought an abandoned but substantial four-room cottage on a neighboring farm and moved it to the orchard of the home place, near enough and not too near the family of our son. We reserved a garden, chicken yard and of course a little lawn.

From the beginning it has been a strictly business proposition. They invite us to a meal and we invite them. The grandchildren work for us they are paid on the spot with fair wages. I drive a team or do like work that a man of my age can do. I take my fair pay, and then in turn pay for cultivating my garden with my son's machinery which saves much hoeing.

All Treated Alike

None of the other children can say that Tom, the son at home, has anything on them, to use a slang expression, for all are treated alike. I bought a good second-hand automobile for our use and get one of the grandchildren to drive it, always paying for the service. It makes us feel independent and pleases the young folks, for it is some sacrifice to drive at our rate of speed and occasionally give up pleasures for us.

My wife lives over the past on such occasions as threshing by peeling potatoes, shelling peas and otherwise having some part in the big meals, while I enjoy the light tasks like putting on a board that has been accidentally knocked off and keeping up the orchard. We are retired, but not tired. Also we are saving some money both families—in spite of high taxes. Besides that the farm is growing in fertility and money value, and all the children are as contented with the management as we are. If that isn't eating one's cake and having it, what is? Experienced.

Don't TAKE CHANCES WHEN YOU HARVEST

CASE GRAIN DRILL—gives you a better stand, bigger crop. Saves seed. Steel construction gives great strength with less weight.

CASE-OSBORNE CORN BINDER handles easily for you and the team. Speeds the work—makes harvesting easier.

CASE SILO FILLER cuts up to 30 tons per hour. Does a clean, fast, thorough job.

AFTER ALL the time and money and care spent in bringing your crop up to the point of harvest, don't take chances with any Binder but the best.

The Case-Osborne Grain Binder has always given long, reliable service and the name "Case" on the machine is a guarantee that it always will. It owes much of its worldwide popularity to these exceptional advantages:

- 1 Gets all the grain regardless of condition—straight or tangled, standing or down, tall or short.
- 2 Easy and comfortable to operate—a single spring-assisted lever takes care of moving the reel. Easy on the team—roller-bearing equipment.

3 Bundles are nicely shaped—easy to shock, load and pitch. You can make them any size you like.

4 Constant, steady running, without stops and delays because of extreme care in selecting only the best materials and using experienced workmanship. Thorough knotters tests before Binders leave the factory assure dependable, trouble-free operation right from the start.

There are many other features you have to see to appreciate. Ask your Case dealer to show you the famous Case-Osborne Binder. You'll find more downright value in it than you've ever seen before. Write direct to factory for free folder.

CASE

QUALITY MACHINES for PROFITABLE FARMING

Harbingers of farm prosperity

Advertisements point the way for the prosperous farmer . . . read them.

AGES, it seems, since we used the top buggy to go to town. A. Wouldn't think of it now—except for "joy-rides." Ages, too, since Mother sold her kerosene lamps. Yet not long ago—when you figure time by years.

The auto, the lighting plant, the telephone, a dozen other things you now possess, were thought of as luxuries which the average farmer could not buy. Today they are a necessity on every farm. All of them were advertised before becoming universal.

The advertisements in your farm paper are forerunners of farm prosperity. They introduce progressive methods and popularize them. They show how to save time and money.

Read them. Mark those in which you are particularly interested. Tell the dealer what brand you want. Give him the advertised name of the product. It will pay you to buy advertised goods.

Remember that the manufacturer cannot afford to "spot-light" inferior goods. His branded merchandise must meet with your approval—must give you fair quality for a fair price. He must keep pace with progress to insure you—as well as his own—prosperity.

don't let your Profits get lost in the grass

FREE DAIRY BOOK

Send for our free dairy book. It was written by two widely known dairy authorities and covers breeding, feeding, sanitation, and production methods. You will find it a very valuable book to have. Fill out the coupon today.

Records of more than 13,000 cows in a western state show that cows with an average of 500 lbs. of butterfat a year, at a feed cost of \$92.00, averaged \$176.00 profit—in contrast to cows making 100 lbs. of butterfat at \$40.00 feed cost but only \$18.00 profit.

Milk profits are made by good feeding. Keep that in mind when pastures begin to turn green. Graze your cows if you have good pasture, but, remember, pasture alone is not enough. A cow producing 30 lbs. of milk a day requires nourishment equal to 175 lbs. of grass, but she cannot eat anything like that quantity of grass. A good dairy feed is needed, and the better the feed the more milk you get.

Protect your profits and make your pasture a real asset by feeding Gold Medal Dairy Ration—a "Farm-tested" ration as scientifically blended as the famous Gold Medal "Kitchen-tested" Flour. It is made by the same specialists. The thousands of dairymen who feed Gold Medal know from experience that it is the most profitable ration they can buy. Besides getting more milk Gold Medal Dairy Ration keeps cows in good condition.

Name _____ Address _____
Town _____ State _____
My Feed Dealer _____

I DO not know that it would have any real value, but I wish the results of the census now being taken would show how many people born on farms are now farming as a life's business; also how many town and city people moved off farms and entered other callings. I have been thinking on this subject a good bit of late, and, as far as my personal acquaintance goes, I am astonished at the facts.

Not to go outside my own family the figures are startling. In my paternal grandfather's family were nine boys and two girls. All married and raised families. Seven of my uncles and one aunt lived on farms and farmed most of their lives. The grandparents referred to had 43 grand children, the children of the eleven sons and daughters. Thirty of the grandchildren are boys and thirteen are girls. Now comes the startling fact. Only one of the 30 grandsons is a farmer living on a farm, and so far as I know only one of the granddaughters is married to a farmer!

On my mother's side are fewer descendants, but not a single one of them is living on a farm.

Both my grandfathers, as were their fathers before them, were farmers. They knew nothing else—thought of nothing else. In fact, aside from some lumbering, there was nothing else to do. On my wife's side of the house the case is no different. She is one of eight children—five boys and three girls. Her father was a dyed-in-the-wool farmer. He took pride in it and added dignity to the calling. All occupations were second in importance to farming in his mind. Of these eight children, one son is manager of an institutional farm and one daughter is married to a farmer. Of the 25 grandchildren in this family, one daughter married a farmer!

I believe I could relate a number of instances in my acquaintance, even if not so accurate, which shows how the farm population has changed in the last fifty years. I well remember that one of the concerns of farm parents in my boyhood days was how to keep the boys on the farm. The generation of which I speak scarcely ever held a meeting that they did not discuss this subject. Speeches were made and essays without number were read. But the above figures show how vain were their efforts.

But what would have been the result if they had been successful in persuading all the young people to take up farming? The farmers' great handicap today is surplus production—too much wheat, too much cotton, too many potatoes, too much livestock. Improved methods and modern machinery have enabled the one boy in ten to do more than all could have done by the methods used by my grandfathers.

But what has been the result in the fields to which the children and grandchildren flitted from the farms? Are they faring as well, and are they as good and reliable as were the concerned grandparents? For be it known that the parents who were so solicitous to keep the boys and girls on the farm were concerned chiefly about their moral and spiritual welfare. They honestly believed that an disaster awaited those who left the farm for other callings that sin and poverty would be the lot of those who deserted the farm. Were their fears justified?

Of course it was impossible to foresee the changes in life that were to

come. The business and social world have been revolutionized in the last thirty years. There are no longer the high walls created by class consciousness which separated communities and classes. There has been a leveling-up as well as leveling down. Good roads and modern methods of transportation have made common the best as well as the worst in human practices. It would be a hazardous thing to say that the countryside is free from the baneful influences that were once confined to the cities.

April is near its close as this year. We have had two mornings on which ice appeared—once as thin as single window glass. Peaches and cherries were in full bloom. Although the peaches show little or no bad effects at Neshaminy Gardens still only time will tell whether or not they have been injured. The paragraph which shot some through a week ago is at a complete standstill. An application of fertilizer was given it today, something that should have been done last July instead.

Friendly Talks

By
Edgar L.
Vincent

A MAN stood at the far side of his field and looked back over the furrow he had turned. "That's pretty good," he said to himself. "One or two little balks, but can do better than that." Then he started back over the field. Bound to do better.

And it is a fact that the better a man does today the better he can do tomorrow. The axe blow struck true and true this time makes it easier to strike another still truer next time. The law of nature makes it so. The law holds good with the artist. The picture he paints this time is a prophecy of the finer production of the future. The heart of the young clerk bounds when he makes a good sale, for he knows it will help him to make a better one later in the day. But it will not be so unless he burns in the heart the will to make the life of the present better than that of the day gone by.

A man may run over the field with his plow or his seeder, but his drill year after year as long as he lives and at the end leave it poorer than it was in the beginning, simply because he is not inspired by the spirit of ambition. Thousands of men do this. "Going back," the farmer tells the story of every such farm. The life, for there is no standing still, the farm which does not improve is a way backward.

One of the finest things about farming more of self into the farming today than we did yesterday is that such farming lifts the entire community to a higher level. If I see raising better crops, making a better home more beautiful and attractive, I at once think, "That's good, can do it myself," and I try to do it. So from farm to farm the demand to push on spreads. We can all take a hand in this work. Shall we not do it?

A THREE-YEAR experiment by Correll gave the highest yield for potatoes planted May 20. Late plantings showed decreased yields.

Licensing and Bonding New Jersey Buyers

Legislative Enactments Designed to Protect Fruit and Vegetable Producers and Dairymen

By WILLIAM B. DURYEE, Secretary
New Jersey Department of Agriculture

THREE legislative statutes in New Jersey are especially designed to protect the producer of farm commodities from fraud and deception on the part of unscrupulous dealers and distributors. These are: first, an act requiring the licensing and bonding of commission merchants, salesmen and brokers (Chap. 93, Laws of 1930); second, an act providing for the licensing and bonding of all dealers in milk and cream who purchase from producers (Chap. 74, Laws of 1917); and third, an act to regulate the sale and delivery of peach, plum, apple, pear or cherry trees under contract guaranteeing said trees to be true to the name under which they are sold (Chap. 28, Laws of 1926).

The first statute referred to is far reaching in scope and revolutionary in type so far as the state of New Jersey is concerned. It requires that commission merchants, dealers and brokers must not engage in business after July 1, 1930, unless such person, firm, association or corporation be duly licensed to engage in the business of buying any perishable agricultural commodity for the purpose of shipping, or for sale, resale or manufacture. The movement toward the passage of this act came from a group of producers who had lost money through the defalcation of a dealer who had purchased their farm produce. The means provided in this law for protection of growers is that buyers shall annually, on or before June 1, file an application with the Secretary of Agriculture of the state for a license, giving definite information regarding to the applicant and the nature of his business, and it requires further that the application shall be accompanied by a surety bond in the sum of at least three thousand dollars. This bond is subject to the approval of the Secretary as to form and sufficiency and is to be deposited with him. When the application and bond are approved, the applicant, on payment of a two-dollar fee, is given a license, good until the first day of July next following.

Effectiveness Depends on Growers

The law provides that should a dealer default in payment of any money due to any grower the grower may file with the Secretary of Agriculture a verified statement of his claim and make request to sue upon the bond. On obtaining such action the grower may prosecute his claim in any court of competent jurisdiction. This means that the action must be brought by the grower himself and the bond is on file which guarantees payment to him upon a favorable decision by the courts as to the grower's case. In other words, the judgment is obtained by the grower and the bond may be used for payment of the judgment.

The act specifically exempts transactions in which the grower receives cash at the time of the transaction and payment of the amount due him in any transaction involving not less than twenty-five dollars, and does not apply to any dairy incorporated agricultural cooperative association. While the act makes it mandatory on persons or corporations engaging in the business of commission merchant, dealer or broker to secure such license, it authorizes the State Department of Agriculture to bring suit for a fine of not more than \$100 and a penalty in the event that such persons operate without a license, the fine being a minimum of \$10 and a maximum of \$500.

This act is extremely broad in its

one-half times the estimated maximum monthly indebtedness.

This law gives the Secretary the right to exempt from the act those dealers who buy from not more than two producers or whose total purchases of milk do not exceed the sum of \$200. It provides further that a license shall not be issued if a justified complaint has been established against the applicant during the preceding year.

The number of milk dealers in New Jersey who are now licensed is 232 and there are on file bonds totalling more than one-half million dollars. The provisions of this act are invoked with great frequency. Its operation has been welcomed by the honest buyers who predominate in the industry, and it protects such buyers from unfair competition, as it protects farmers who utilize its provisions. The Secretary is given certain discretionary powers as to the application of the bond and the law prescribes methods by which complaints by farmers shall be filed and the action which shall be taken upon receipt of such complaints. In this law the action is brought by the Department, acting upon the complaints of farmers, rather than by the farmers themselves who have been defrauded.

"True-to-Name Fruit Law"

A similar act on the statute books of the state of New York was recently questioned as to its constitutionality and the objecting milk dealer was upheld in his contentions by the Supreme Court. The case was then carried to the Court of Appeals by the Attorney-General for New York and this Court reversed the decision of the lower body, stating that this act was entirely within the rights of the Legislature and in the decision quoted the necessity of payment to farmers for milk if cities are to be supplied with that commodity on a stabilized basis.

Besides New York and New Jersey, other states which have passed similar laws are Connecticut, New Hampshire, Rhode Island, Vermont and Wisconsin. It is believed that this decision by the New York Court of Appeals will settle the questions that have been raised in New York and elsewhere regarding the validity of such licensing statutes.

The third act which will be described briefly is known as the "True-to-Name Fruit Law." While this has not been invoked to anywhere near the degree that the milk dealers' licensing act has been or that we anticipate in the new law regarding the licensing of produce buyers, its presence on the statute books gives protection to those who wish to use its provisions. The law is applicable under these stipulations:

First, there must be a contract guaranteeing said trees to be true to the name under which they are sold; second, the purchaser of such nursery stock is required to file with the Secretary of Agriculture a plan of planting within thirty days after the trees are planted.

In most cases the seller of nursery stock explicitly refrains from giving any guarantee as to the truthfulness of varietal type and name of the tree he is selling to the fruit grower and the grower purchasing the trees depends more on the good faith of the nurseryman than he does on invoking this act through action by the state. (Continued on page 28.)

"A LITTLE FARM WELL KEPT"

This is a photo of Steve Kissel's home in Marshall county, W. Va. Mr. Kissel's farm consists of only 20 acres, but he practices intensive farming and clears nearly \$1,000 every year raising fruits and vegetables. He has over fifty bird boxes on this little farm. Birds of many kinds help keep the insects cleaned up. His farm is free from weeds and is one of the best kept and most attractive farms along U. S. Route 250 in West Virginia. C. B. Altman.

OVER A MILLION

OVER a million cattle on Pennsylvania farms are now under supervision for control of tuberculosis. This is nearly three-fourths of the state's cattle population and indicates the extent to which testing is followed. The first of April 3,590 herds were on the waiting list for testing. Public sentiment, city regulations and farmers' interests are working together to clean the herds of tuberculosis, and neither the dairy industry nor the consuming public is suffering thereby.

YOUNGER AUDIENCES

A FEW years ago, in commenting on sundry assemblies of farmers, we mentioned the large proportion of elderly men and the small proportion of young men in such meetings. Today we find a much larger percentage of young men, and they are progressive and apparently successful. The effect of work of our schools, our clubs and our extension forces is manifest in several ways and this is merely one of them. It is a sign of promise that our speakers now face younger audiences than ten or twenty years ago.

INSTITUTE OF COOPERATION

THE sixth annual session of the American Institute of Cooperation will be held at the Ohio State University, Columbus, beginning June 16. The Institute has come to be much more than a meeting of those concerned in cooperation. It is a school for the training of those engaged or to be engaged in that work and extends over five weeks. The training school idea is a sound one, for on no subject is there more need of education. Since among the several courses there is one on economics we rashly venture a suggestion: Let our agricultural leaders drop their leading strings long enough to take it.

A CONTRAST

SOME years ago, when our youthful county agents were starting their work, we heard many complaints to the effect that they were not endowed with "practical" farm wisdom and therefore could not be of much value. The boys soon knocked this idea into a cocked hat. Later on some of them left their salaries to become "practical" farmers and in nearly all cases successful ones. Today another objection is raised to the employment of county agents. These men who were considered of no "practical" value ten or fifteen years ago are now blamed for the

PENNSYLVANIA FARMER

overproduction of everything of which there is a surplus. Isn't it peculiar that the same kind of men who discerned the incompetence of the county agents years ago now discover their super-efficiency?

FROM LIFE

MANY years ago two men, both now dead, went into business together. Neither of them knew anything about book keeping but both were active and energetic. After they had gone along for some months, buying and selling certain machinery and appliances used largely by contractors, they sat down one evening to see how they had prospered. Their obligations loomed big, much bigger than their cash and their accounts receivable. They were feeling pretty blue when a friend of both came in and was asked to go over the figures. He called for their inventory, which they had overlooked. A list was made and they were surprised to know how much there was in it. The world seemed like a rosier place. Maybe some of us would find it that way if we made an inventory, not omitting therefrom some things hardly ratable in dollars.

FROM OBSERVATION

AFTER knocking about a bit in the Corn Belt and east of it we can't see evidence of reduction of acreage of staple crops. There is some evidence of a larger corn acreage, which will mean a larger winter wheat acreage next fall if the crop rotation commonly practiced in the past is continued. Another thing appears to be against reduction of crop acreage in territory where mechanical farming is possible. It is easier now to put in a large area than it was before the advent of mechanical power. The weather cannot interfere with planting when it may be done so rapidly as is now possible. When land can be quickly plowed and fitted usually it will be, regardless of the opinions or advice of anybody. Another influence contrary to the reduction of crop areas is the high rate of taxation made necessary by improved roads, schools and other public creations. There is only one way for farmers to pay high taxes and that is to produce something to sell, to raise something that can be sold or can be converted into a salable commodity, for taxes must be paid in cash. This influence likewise is more potent than any quantity of advice. We can't see how farmers who carry on at all are going to decrease total crop areas, though they may shift about somewhat from one thing to another. We can't see that they are actually reducing crop areas. And we don't believe they are going to do it.

MEN AND COWS

WE know that the average dairy cow of this day produces more milk and butterfat than the average cow of thirty or forty years ago. We know that breeding, feeding, culling, care, etc., are responsible for the difference. To what extent each is responsible we don't know, nor do we know just how much the improvement of the dairyman has to do with the improvement of the cow. Here are three herds in one county, all in cow-test associations for ten years. One herd has increased its average production per cow 6,493 lbs. of milk and 224.5 lbs. of butterfat since 1920; another herd has increased 6,220 lbs. of milk and 198.8 lbs. of butterfat per cow; and a third has increased 4,661 lbs. of milk and 159.1 lbs. of butterfat per cow. If we could get the owners of these three herds to tell just how it was done we would have three good dairy stories, and probably three interesting human documents as well.

INCREASING WHEAT AREAS

WHILE an agency of our government is advocating a reduction in the production of wheat the government of Australia

is not merely advocating an increase but proposes to put up a guaranteed price of four shillings a bushel to get it. The farmers of Victoria are asked by both federal and state governments to increase their wheat area to see these machines in operation on five million acres. They want a guaranteed price of five shillings a bushel, but will probably get four or less. The reason for such an increase in the face of high world production is that Australia's trade with Great Britain is out of balance. Australia needs something to export in order to restore what is considered the proper relation between imports and exports. Wheat has been chosen as a commodity which Britain must import and will import from Australia rather than from the United States or Argentina.

A DEMAND FOR REPEAL

A VIVID discussion of the Federal Farm Marketing Act, particularly the so-called stabilization feature of it, occurred at the annual meeting of the Chamber of Commerce of the United States last week. Chairman Legge of the Federal Farm Board and Secretary of Agriculture Hyde were the chief defenders of the Act. Its assailants represented many commercial organizations affected directly or indirectly by the operations of the Federal Farm Board and its subsidiaries. The defense was not impressive from the standpoint of the economist, but it was impressive in reminding the interests represented that they had received special consideration in legislation. After hearing both sides the delegates voted "with practical unanimity" for a resolution demanding the amendment of the Act to repeal the authority of the Federal Farm Board to use government funds to participate in business. That resolution is a rather ponderous document which we refrain from quoting in full. The essential part of it follows:

The anticipated benefits to the farming interest as a whole have not been realized. On the contrary there has been impairment of the market structure and prevention of support which otherwise would have been given to the marketing of agricultural products which were affected by the use of public monies. Without benefit to agriculture there have been imposed unbearable hardships upon business enterprises unable to maintain their position against discriminatory competition from the Government.

We accordingly express our continued opposition to the use of the Government funds in providing capital for the operation of agricultural cooperatives, and for the buying and selling of commodities for the purpose of attempted stabilization. We condemn as a permanent policy of Government the employment of public funds for the purpose of participation in business in competition with established agencies and support the proposal for amendment of the agricultural marketing act to repeal the authority of the Federal Farm Board to use Federal funds for such a purpose.

We advocate the continuance of the Federal Farm Board as a proper agency, conducted at Federal expense, for the gathering and circulation of authoritative information, for ascertaining conditions of overproduction, for advice as to its prevention, and for assistance toward the solution of the numerous and important business problems affecting agriculture both in production and in marketing.

Thus does the Chamber of Commerce of the United States demand that the government get out of business, after snoozing comfortably while Congress put it into business. Farmers have not had sufficient experience with official operations to allow them to determine the effects of government speculation under the name of stabilization, but that does not realize what these operations signify. They will probably demand the repeal of this feature of the Farm Marketing Act because of its effect on agriculture. Chairman Legge's comment on the Chamber of Commerce resolution is an appeal to prejudice rather than to reason, and the latter should prevail in the discussion of such an important economic problem as this.

May 10, 1930

THE two-day demonstration of labor-saving machinery which was held in North Jersey on April 25 and 26 and the large crowd of farmers who came to see these machines in operation on the farm of Paul Koskie, near Hackensack, emphasizes the interest of farmers in cutting their labor costs. This is particularly true of those vegetable growers of that suburban farm land almost within the shadow of New York City. Recent investigations show their labor to be the most expensive single item in the cost of producing vegetables, and that for every dollar received by the North Jersey vegetable growers for their crops approximately 44 cents must be spent for labor.

The field tractors created the greatest amount of interest the first afternoon. Eight different makes of tractors, four wheel drive, track laying and general farm tractors, were closely observed as they plowed and prepared the seedbeds for planting. Vegetable growers not only had an opportunity to see the several makes of garden tractors in operation, but were given the privilege to operate them under field conditions.

Besides a two-row power-driven celery transporter, there were dusters, sprayers, mowing machines, irrigation equipment and other machines of special interest to vegetable growers.

This demonstration, which was arranged by the county agents of Bergen, Passaic and Essex counties in cooperation with the agricultural engineer and vegetable gardening specialist at the Experiment Station, was welcomed by North Jersey growers and gave them an opportunity to compare machines in which they were specially interested.

GEORGE A. WHEATON, of Bridgeton; Roger L. Merrick, of Farmingdale; Ida Amelle Hammell, of Sparta, and Irma Riddle, of Belvidere, are the delegates from New Jersey who will attend the Fourth National Boys' and Girls' Four-H Club Camp, which is to be held in Washington, D. C., from June 18 to 24. From all parts of the United States club boys and girls who are leaders in their communities and states and who have developed outstanding club projects will gather for a week of training in leadership, citizenship and efficient club organization. These rural young folks return from the Four-H Club Camp with a better idea of how they can best aid in the development of farm life in their home community.

From the 6,000 or more members in New Jersey these four young farm leaders were chosen to represent the state. The selection was based on their records of leadership and accomplishment in club activities.

George Wheaton, who is only 16 years of age, has been active in dairy club work in Cumberland county for the past eight years. Since he first organized a Four-H calf club in 1922 his profits from cattle have already amounted to \$2,400. One of his bull calves was recently sold for \$125. His first purchase was "The Maple Lady," a pure-bred Guernsey calf, and three years later he obtained "Forham Good Boy," a Guernsey bull which was a gift from Joseph L. Hope of Madison.

George now owns eight pure-bred Guernseys, three head sires, a young bull, and five cows. Through membership in a local dairy herd improvement association he has kept accurate records on the cost of production of his herd. During the past five years he has shown his cattle at the Garden State Fair at Bridgeton, where last year he won \$108 in prize money, and for two years has shown at the Trenton Inter-State Fair.

When Roger Merrick, a senior in Freehold High School, goes to Four-H Camp he will be able to talk club projects with all the delegates. He is a versatile sort of chap in his agricultural interests, and, although his major interest is in dairying, he has conducted projects in poultry keeping, vine growing, gardening, corn growing and forestry. This 18-year-old club boy is the owner of a herd of seven animals, three of which are pure-bred Guernseys. Roger is not only recognized by other members as a judge of dairy cattle, but last year he won \$125 by showing his animals at fairs.

Ida Hammell has been an active Four-H Club member for the past seven years and during that time has helped to organize several new clubs for girls in Sussex county. She is 16 years of age, a sophomore in Newton High School and interested in club projects in food preservation, home management and tree making.

PENNSYLVANIA FARMER

New Jersey Farm Comment

By G. W. HARRIS

Irma Riddle, the other girl who will represent New Jersey at Washington, is the same age as Ida and a junior in high school. Six years of club work and leadership qualities have given Irma this opportunity to meet with Four-H Club leaders of the United States.

In choosing these four young folks as delegates to the Four-H Club Camp at Washington and in singing their praises, the work of the other 6,000 club members in New Jersey is not forgotten. Not all can be given this opportunity, an opportunity which should be prized by the fortunate few and striven for by all. Most community club leaders return from the National Camp with a broader outlook on Four-H Club work and with the realization that they are but a small part of a great agricultural movement, and this is as it should be.

This four-wheel drive tractor attracted much attention at the North Jersey machinery demonstration.

A CAMPAIGN to dress up Burlington county farms is directed toward all unpainted farm buildings in that county. Beautification is not the only objective—the value of good paint in adding to the life of buildings is recognized by all and cannot be emphasized too strongly. During recent years methods of applying paint to broad surfaces has been changing from the old hand brush method to a more rapid and labor-saving spraying system.

A barn paint spraying demonstration at the farm of Aaron H. Burtis on Saturday afternoon of April 26 drew a crowd of 150 farmers to witness the effectiveness of spray machines for the painting of farm buildings. A barn built 82 years ago received its first coat of paint on Saturday. The building is 47 feet long and 27 feet wide, with 20-foot posts.

Saving in labor in applying paint was most striking—two men working on the demonstration went up the ladders at 1:40 and at exactly 4:20 the barn was completely painted. It took but two hours and forty minutes to completely cover that building in a manner which brought many favorable comments from the observers.

While more paint may be used when a spray is used, the saving in labor in most cases will offset this extra expense. And with most farmers time and labor is a greater problem in painting than the cost of materials.

Mr. Burtis finished painting the remainder of his farm buildings last week. As a result of this demonstration many other farmers in the county are considering giving their buildings a coat of good paint with the sprayer.

SWEET POTATO production is an important industry to South Jersey farmers and in years past losses from stem rot, black rot and scurf have at times been serious. This has been true especially during dry seasons.

Dr. W. H. Martin at the Experiment Station has been working with growers for several years in an effort to find effective controls for these three common diseases. To reduce losses from stem rot he advises the growing of resistant varieties such as White Yam or Red Brazil, or the use of the

strains of the Yellow Jersey and the practice of seed selection.

After four years of research work in an effort to obtain a simple and efficient method of control of scurf and black rot Dr. Martin says:

"Through these investigations it has been found that dipping the fresh pulled sprouts in a suspension of organic mercury will greatly decrease the severity of scurf and black rot. In a test conducted in 1928, only 16.7 per cent of the potatoes from the untreated sprouts were free from black rot as compared with 81.9 per cent for the potatoes from the treated sprouts. In 1929, over 35 per cent of the potatoes from untreated sprouts were so badly scurfed as to be unsalable. In the three tests conducted in 1930 the increases in yield as a result of sprout treatments ranged from 10.5 to 54.1 bushels an acre.

"This method of disease control is simple. The organic mercury compound used is made up at the desired concentration in a wooden container. The sprouts are pulled and dipped in the solution. When dipping the sprouts, try to keep the chemical from the leaves of the plant. Only the underground portion of the plant should be dipped. After dipping, the sprouts should be placed in a container and transferred to the field of planting."

It will soon be time to consider vaccination of early hatched birds for the control of fowl pox. Recommendations are that Leghorns be vaccinated when they are four months of age while Reds, Rocks and Wyandottes should be vaccinated when five months of age.

The Bureau of Animal Industry of the New Jersey Department of Agriculture will work this year on the same basis as in 1929. They offer poultrymen in the state any one of three plans.

1. By making application to the Department of Agriculture, Bureau of Animal Industry, to have the work done by the state; a deposit of two cents a bird is required to cover cost of material and service, and must accompany each written application.

2. Private veterinarians to do the vaccinating; application to be made to the Department of Agriculture, Bureau of Animal Industry, for permission to use fowl pox vaccine. Upon receipt of application, permit will be sent immediately.

3. Owner to vaccinate his own flock; application to be made to the Department of Agriculture, Bureau of Animal Industry, for permission to vaccinate his own flock. Upon receipt of application, permit will be sent immediately.

THE first year of the New Castle County Cow-Testing Association closed on March 31st, 1930. Twenty full-time and three part-time herds were tested during the 12 months period. The butterfat production ranged from an average of 355.5 lbs. per cow to around 230 pounds with the complete association average of 286 pounds. These figures were given in the annual report of Mr. Alois Leinen, supervisor for the association during the year.

Other features of Mr. Leinen's report follow: Nine herds were above 300 pounds of butterfat; four above 290 pounds, six above 250 pounds and one below 250 pounds.

Mr. Carl Feucht of Elkton owns the highest herd in milk and fat production. His Holstein herd of 16 cows averaged 10,126 pounds of milk and 355.5 pounds of butterfat. With an average of 252.8 pounds of fat, the Jersey herd of Mr. J. Howard Mitchell of Hockessin was a close second, while the Holstein herd of Mr. Fred Stafford of Montchanin finished a close second in milk production with an average of 10,120 pounds. Mr. Stafford's cows had an average of 333.1 pounds of fat.

When figured on a comparable wholesale price basis, the Jersey herd of Mr. Willson Price of near Glasgow returned the most money per individual cow. Mr. Price produced butterfat at a feed cost of \$32 per pound and milk at a cost of \$1.51 per 100 pounds. His feed cost per cow was \$107.13 with the lowest feed cost per cow of \$84.14 going to Mr. George Pierson of Hockessin.

The Brookwood Farm of Mr. Henry B. Thompson near Greenville, managed by Mr. Geo. Fly, had the herd producing both fat and milk at the lowest feed cost. This Holstein herd of 13 cows produced butterfat at a feed cost of \$27 per pound and milk at the low figure of \$22 per 100 pounds. The feed cost to produce one pound of fat and one pound of milk was \$27.14. The feed cost for fat and milk was \$27.14 per 100 pounds.

Vacation Special to the Far West

As announced in a recent issue the Pennsylvania Farmer will run a farmers' vacation trip to the Far West this summer. It will be a personally-conducted, all-expense tour for farmers and their wives, starting from Philadelphia and Harrisburg on July 26 and returning 15 days later.

Special Pullman cars providing the utmost degree of comfort and convenience will be used. Food and service will be first-class and everything arranged to make a pleasant and profitable two weeks for farm folks who want a little rest from the strain of heavy summer work.

Leaving Philadelphia 8:40 a. m. and Harrisburg 11:37 a. m. the special cars will pick up tourists at Lancaster and other convenient points and go to Buffalo by way of Williamsport, passing through the Susquehanna valley and the wooded hills of northern Pennsylvania, crossing the rich fruit and dairy region of western New York. It will be a pleasant daylight ride and will land the travelers in Buffalo in time for them to see Niagara Falls illuminated by colored electric lights. Searchlights, covered with vari-colored screens, play over the falls at night, resulting in a most spectacular effect as the natural beauty of this famous cataract is further enhanced by artificial means.

At Niagara Falls we shall cross into Canada and take a direct route to Chicago by way of Detroit. A stop will be made in Chicago Sunday morning, permitting church attendance and a view of the downtown business section of that city.

After church Sunday morning the party will leave Chicago, travel through the great corn country of northern Illinois to the Mississippi River, a distance of about 125 miles, then follow the river 300 miles north to St. Paul. This ride along the banks of the Mississippi will be found particularly enjoyable, for the river will be in sight practically all the way. In fact the roadbed is so close to the river in some places that the country to the right is out of sight. This is part of the famous dairy section of Wisconsin and should be of special interest to dairymen of Pennsylvania and adjoining states.

A wheat field about ready for harvest is a pleasant sight. Multiply this by the thousands of acres in North Dakota and eastern Montana and try to imagine the picture. Or better still go on this tour and see for yourself the wheat field that stretches from Minnesota to the cattle country of Montana.

After the wheat come the cattle ranges which reach to the Rockies. And in the heart of the Rockies, on top of the world, is Glacier National park, a region so replete in scenic wonder that the government has set it aside for entertainment of the public.

Cody Road to Yellowstone Park. Shoshone River and Canyon.

Of this Park Mary Roberts Rinehart says: "Here is the home of a vanishing race the Blackfeet Indians. Here is the last stand of the

Rocky Mountain sheep and the Rocky Mountain goat; here are elk, deer, black and grizzly bears and mountain lions. Here are trails that follow the old game trails along the mountain side; here are meadows of June roses, forget-me-nots, larkspur and Indian paint-brush growing beside glaciers, snow fields and a beauty to make you gasp.

"I have traveled a great deal in Europe. The Alps have never held this lure for me. Perhaps it is because these mountains are my own—in my own country."

The next sightseeing stop will be at Spokane, Washington, known as the friendly city. A trading post in 1872 it now has a population of over 125,000 and is the hub of an enterprising region. So rapid has been its growth that the pioneer who laid out the townsite lived to see the city pass the 100,000 mark.

"Dropped down, like a jewel, in the midst of mountains dark with pines and surrounded by lakes and rushing, snow-water streams, Spokane at once charms the eye and engages the heart. There are no slums or tenement districts here. A debutante of a city it stands smiling and eager, in the midst of beauty."

A four-hour run from Spokane will bring us to

ON THE AIR

"THE Empire Builders" is the name of a nationally broadcast series of radio programs sponsored by the Great Northern Railway, which describes part of the territory to be visited on the Pennsylvania Farmer tour this summer. The programs are given each Monday night at 10:30 to 11, Eastern Standard Time, over a network of the National Broadcasting Company, which includes KDKA, Pittsburgh; WJZ, New York; and WHAM, Rochester. They will be found especially interesting to those planning to go on our summer trip and well worth listening to by any one, regardless of vacation plans.

Wenatchee, where a stop will be made to inspect the orchards of this famous apple region.

Early the following morning we shall reach Vancouver, British Columbia, where a boat ride over the picturesque Strait of Georgia to Victoria has been arranged and will be one of the most enjoyable days of the trip. The end of this eventful day will find us in Seattle, where the evening will be spent.

Seattle, "gateway to the Orient," has more to offer the tourist than we could even enumerate. "Sitting like Rome upon her hills, Seattle faces to the West the intimate though lordly Olympics. Mount Ranier looms close in the southern sky; Mount Baker to the north and the sun rises, rose-pink, over the majestic Cascades, mirrored in the waters of Lake Washington." However, we'll have to miss the sunrise if we get to the great lumber camp at Longview on schedule. Here is found the largest lumber manufacturing plant in the world, 79 acres under one roof and a daily capacity of nearly two million feet of finished lumber—enough to build about 200 frame houses of five rooms each.

Next comes Portland, Oregon, "city of roses," so-called from the rose-hedged streets stretching for miles in a riot of color. This place has come rapidly to the front as a wheat shipping port in recent

Top—Lake McDonald in Glacier National Park is surrounded by imposing peaks. It is one of the places to be visited on our western tour.

Right—Shoshone dam and reservoir on Cody Road to Yellowstone Park.

years. It is an industrial center and is situated in a country of mountains and glaciers and picturesque drives.

The following day will be Sunday, August 3, the forenoon of which will be spent back in Spokane for church attendance, leaving in the afternoon for the Gardiner gateway to Yellowstone National Park. Three days will be spent in the Yellowstone, most famous of national parks. A glimpse of its natural wonders will do more than a volume of words to show one why this place has gained its reputation. As one observer says, "There is nothing in all the world like Yellowstone National Park. You can't make it relative, because there is no standard of comparison. It is the real wonderland, embracing an aggregation of fantastic phenomena as weird as it is wild and remarkable." And when we leave the Park it will be by the famous Cody Road, "90-mile motor highway of scenic splendor with a thrill around every curve—and curves there are, aplenty."

Entraining again at the town of Cody (named for Buffalo Bill), we go to Denver, Colorado, in addition to being an interesting town from a historic standpoint Denver is in the vicinity of Pike's Peak, and near to Colorado Springs, of Garden of the Gods fame. Pike's Peak is of course one of the most famous mountains in the world, but before we reach it we pass through one of the richest farming districts in this country, the Poudre region of Colorado, where they raise sugar beets and feed lambs.

Leaving Colorado Springs we go to Kansas City by way of Pueblo. Then from Kansas City to St. Louis and on east, crossing the great wheat fields of Kansas about the time the wheat is harvested, and through the heart of the Corn Belt of Illinois, Indiana and Ohio when the corn is about tasseling, a favorable season to see this great native American farm crop at its best.

We cannot tell all about this trip in one or several issues of this paper, so we are having printed additional information in booklet form which you shall be glad to send to any one who writes for it. The booklet will contain complete costs, schedule of dates and stopping places, etc. And we shall be glad at any time to answer questions that occur to you in connection with this vacation.

We are printing a blank on this page for your convenience in requesting further information about the trip. Filling out this blank of course entails no obligation on your part, but will furnish you with complete details of the tour. Just fill in your name and address and mail the coupon to Tour Manager, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Milly Woodbridge's Trek to the Pacific

The Pioneers of the Peace River Valley

By C. A. Stephens

Copyright, 1930, by Capper-Harman-Stocum, Inc.

SYNOPSIS

Two New England families, who have gone to the Peace River country in Canada to make homes, find themselves in unfortunate circumstances when the railroad, on which they had based their hopes, is not built near where they have settled. One of the families, the Mastermans, moves away, but the other, the Woodbridges, remains in the vain hope that something will happen to create business for the sawmill they have built. The son and daughter decide following the Mastermans' example and go back to civilization while they still have enough money to make the journey, but the father refuses to leave his mill. At last, when it became evident that they could not live through another winter on the Peace river, and after their money had been spent, they started to walk across the thousand miles of wilderness, and mountains that stretched between them and the Pacific Coast.

while thus engaged one afternoon—a few days later—she made a gruesome discovery, one not without semblance of tragedy. Down near the river bank, at some little distance from the trail and the hillside where they were making their evening camp, Milly had come upon a little old log hut, evidently long deserted, about which had sprung up so dense a thicket of young firs and willows as almost wholly to conceal it from view. The squaw had come hastening back and by signs to Milly and Winthrop, induced them to follow her. The door of the hut was barred on the inside. Nearer the river stood a "cradle" such as miners make use of in placer washings for gold. Hard by lay a rusted shovel, pick and ax, also a crow-bar and a broken sieve. Plainly it was a miner's outfit, abandoned, to judge from appearances, a number of years ago. Placer mining for gold at gravel bars on the Peace has been going on for twenty

The Cheerful Plowman

USING THE LIBRARY

OUR library is filled with books that tell of plumb-ers and of cooks, of beautifying cozy nooks. They tell of horses and of cows, of flowing wells and bulging mows, of cultivators and of plows. Some of those books tell how to make the very choicest kinds of cake; they tell us when to hoe and rake. Some of them tell how plums are stewed, how coffee's made and tea is brewed, how broken furniture is glued. And other books in that great stack tell how to treat an aching back, and how to build a barley rack; they also tell of cures for pip and rheumatism in the hip, and how to mend a splitting lip.

There is no day in all the year when I don't have some good books here from out that stack of books, I fear. I have a book at my hand, where it is very quickly manned when I would man it, understand! When I've a gap between my meals I read a few improvement spiels, I read a mite on mules and seals, I read a snatch about the dog, a page or two about the hog, perchance a chapter on the frog.

I'm always learning something new, I'm grabbing thoughtlets, quite a few, on boiling beef and turkey stew. I'm learning as I go along, my brain is budding thick and strong. I feel neglect is cheap and wrong.

I have a neighbor who will doze for hours and hours in dumb repose, to that book stack he never goes. His talk is stale and has no kick, his company would make one sick, his brain is thin, his skull is thick. When there's a chance brought right to hand for him to join the reading band, he takes no lessons, understand.

I could not live unless I learned. With grim remorse I would be burned if chance for building brain I spurned. So I lug home three books per week and in those books I peer and seek. I would not be a mindless geek, I wish to have a fund of thoughts, good data on both buns and bots, a headful of forget-me-nots!

J. E. T.

years or more; and the fact of finding the hut there was of itself not surprising.

Winthrop now tried the door again; and evidences that the cabin had long been unoccupied were so clear that they did not scruple to break in. What they saw, however, when the afternoon sunshine once more lighted the dark and musty interior, gave them a distinct shock. There was a rude table with tinware on it, a bench beside it and beyond, against the wall of the hut, a sodden couch upon which reclined in a sitting posture the dry, shrunken brown skeleton of a human being. Milly drew back with a shudder. "Come away," she whispered. "Oh, he was murdered, or he perished there alone!"

Woodbridge, senior, however, thought that if possible something more should be learned concerning the unfortunate, in order that word might be sent to his relatives or friends, if such he had. Winthrop, accompanied by his father, went back and searched the hut quite carefully. In a mildewed garment, probably a coat, on the mouldered blankets of the couch, two letters were found, but both too much discolored by wet to be legible. On the table lay a government survey report of British Columbia, bearing date of 1903, also what was evidently a survey map of the course of the Peace River. One worn glove lay on the bench, and upon turning the couch over, the mate to it was discovered between the blankets. It was tied at the wrist with a thong, to form a kind of pouch, and the middle finger contained five ounces of fine gold grains, evidently cradled from the river gravel. There were no indications of violence or foul play. Death would appear to have occurred from natural causes. They took away the glove with its fingerful of gold, thinking that if by future inquiry the relatives of the missing man should be heard of, his little treasure could be sent them.

Next morning, too, Woodbridge and his son dug the semblance of a grave near the hut—with the dead man's rusted shovel—and buried the remains, wrapped in the mouldered blankets. Common humanity seemed to demand this last service in behalf of a fellow being who had perished there unattended and alone.

Several days passed ere our adventurous travelers could wholly shake off the gloom of this depressing incident. Other and more personal anxieties, however, soon distracted their thoughts.

TWO days later—the 16th day of their journey—the Woodbridges reached the junction of the two large rivers which unite to form the Peace, namely, the Finlay and the Wild Parsnip river, generally spoken of as the Parsnip. The Finlay rises far up in the Northwest, toward Alaska, and after a devious course of three hundred miles or more meets the Parsnip flowing northerly from equally distant sources far to the southward: two noble streams, each as large as the Connecticut at Hartford, or the Wabash at its junction with the Ohio. For size and length, indeed, the Peace might not inappropriately be compared with this latter large river of our Middle West.

Here they were in not a little doubt as to the best route from that point on to Prince Rupert. There is a horse trail down the valley of the Parsnip, used for the most part by miners and prospectors, all the way to Fort McLeod and Fort Fraser. But this they feared would take them too far southward. To follow the Parsnip, too, they would have to cross the Finlay, now high from the melting of the snows in the mountains, and they had no means of ferrying across it, either for themselves or their stock. They determined, therefore, to proceed along the north bank of the Finlay on a generally westerly course. The trail by the latter stream, however, proved an exceedingly difficult one and easy to lose. In many places where the growth was thick a path had actually to be cut with an ax.

Cloudy, rainy weather now came on. Woodbridge, senior, suffered from a cold; and the night before the confluence of the Finlay with the Omineca was reached, a period of great anxiety for Milly and Winthrop began. Their father's cough had been worse for several days, and during that night they were startled by hearing him speak to them in a strange, muffled tone of voice. A hemorrhage from the lungs had been started by his cough. It was quite profuse; there was little they could do save to rekindle their campfire and give him warm drinks. He lost considerable blood from it before it ceased.

(To be continued.)

The Farm Home

Better Coffee

THE farm woman has the reputation of being the best all-around cook in America, better than her city sister and better than the professional chef.

One reason behind this reputation is that she is able to get manufactured food products for her table as easily as the city woman, besides having fresh produce always on hand. The second reason—and the most important—is that the farmer's wife must be a good cook because she has hard-working menfolk who require tasty, solid meals that build and sustain energy over long periods.

Most farm families drink a great deal of coffee without being aware of the fact that it is one of the most valuable energy-producers on their table. Coffee is not a food, but is what is called by scientists a nerve nutrient. It has been found by research authorities to stimulate both the muscles and the brain to increased activity without bringing about any injurious reaction. It is one of the few stimulants known to science that raises the efficiency of the human body and yet does not result in depression after the stimulation has worn off—the body returns to normal, not to subnormal.

Despite the fact that most cooks serve coffee at least once a day, a surprisingly large number do not know how to make it properly. Because it is easy to brew they do not pay attention to details essential to a perfect beverage.

In the first place, coffee should be fresh. After it is ground it should not be exposed to the air so that its fine taste will evaporate. Nearly all coffee now sold in packages is sealed immediately after it is ground, and consequently it is fresh when you buy it.

The Drip Method

When making coffee by the drip method the water should be brought to a boil and, while it is still galling, be filtered through the grounds only once. This operation should never take longer than two minutes, and even less if possible, because it will extract all of the good properties from the grounds without any of the bitter taste. Grounds should never be used twice—the first brew made from them will take out from 85 to 90 per cent of the essence of good coffee. Coffee brewed by the drip method, which is considered the best by many experts, should be ground to the fineness of corn meal.

When using a percolator let the water pass through the grounds just long enough to extract the good flavor. This depends largely upon the kind of coffee used and the fineness of the grind, and it can be easily determined by observation over a short period.

Coffee made in an ordinary coffee pot should be removed from the heat just as it comes to the boil, and then allowed to steep for from three to five minutes.

See that your coffee pot is kept clean and scoured so that fresh coffee will not have a stale taste. To be at its best, coffee should always be served piping hot. The correct proportion is one tablespoon coffee to one cup of water, with an extra portion of each to allow for evaporation.

Note:—Let us discuss with you any coffee problems that are bothering you. Write us freely asking any and as many questions as you wish. Enclose a self-addressed stamped envelope, and send your letter to Home Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Old Fashioned Scraped Apple

A PRACTICAL nurse found the household disorganized because of the illness of Mother. The children were whining, the aged grandmother was complaining and everything was at "loose ends." In less than an hour peace and happiness had descended upon that noisy home and the patient required what had happened.

The nurse laughed and said that grandmother and all the children were happily scraping and

eating apples together. As a matter of fact the hastily prepared, and unsuited diet had left every member of the family lacking in the right kind of food, and the lengthy task of scraping and eating apples soothed the nerves and supplied the stomachs with fruit easy to digest.

If you don't believe it is soothing and helpful try it yourself. Sit down to scrape and slowly eat a large apple just as you did in childhood, and see if you do not feel rested and quieted in nerves. There is probably no scientific explanation, but our ancestors got a lot of profit out of eating scraped apple, giving the baby a helping now and then, and so can we.

Timely Tips

If you don't like vegetables very well, make it a point to eat them near the first of your meal while you are still hungry, and combine them with foods you like. They will taste better that way and they will benefit your health.

Roll dry bread into crumbs and keep a supply stored in a closed container, for quick use in making meat loaf, bread puddings, etc.

To simplify meal-planning where there are children in the family, be sure that you have the simple pudding or custard, the fresh or cooked fruits and the necessary non-starchy vegetables, prepared or ready for preparation, before you spend time making the richer cakes and pies for the older members of the family.

Soak fresh spinach in cold water a half hour before washing. When changing it from one water to another in the process of washing, lift it out, rather than pouring the water off the spinach.

A sheet of oilcloth laid with the shiny side down on top of the dining-table pad, under the tablecloth, prevents moisture from ever soaking through to the table top.

Be Friends with the Birds

WE have seven children here on our farm, and not one of them would willfully harm a bird. Bees of birds have lived about our home for the past fifteen years. We have no cats to frighten them.

One day a nest of young robins was attacked by a prowling black snake that had discovered who lived in the cedar tree. One of the children

hastened to notify me, and quickly the shotgun helped to scatter the snake in at least two pieces. The parent birds were almost immediately hushed, for they seemed to sense at once that the Old Dragon was killed.

Four pairs of cardinals lived with us all winter, and were fed by my little daughter. One evening she mocked the bird that was flying about. He kept answering, and peeping around looking for his mate, almost human in his interest and search.

Anyone can have these friendly birds for neighbors. Two strong pulls are: first, feed them in winter when snows are deep, and second, with the joyous coming of spring, help them with nest-building. Children naturally love the birds, and if that love is fostered in the surroundings, no child will fling a stone or use a sling shot to try his skill on bird life.

J. D.

Even charming clothes depend upon the posture of the wearer for their effectiveness.

Asparagus-Rhubarb

ASPARAGUS and rhubarb are two of the earliest vegetables supplied by the spring garden. They are both excellent foods and are noted as body regulators. Rhubarb contains iron and calcium, according to Miss Ethel Jeffers, nutrition extension specialist of the Pennsylvania State College.

A rhubarb and orange pudding may be made by cutting one quart of rhubarb into inch pieces and four oranges into slices. Arrange these in layers using one-half cup of sugar, in a baking dish and bake in a moderate oven. This pudding may be served either hot or cold. Lemon, with rhubarb, makes a good combination for a pie or tart filling. When making rhubarb sauce, a little lemon juice may be added if desired.

Asparagus is an excellent source of vitamin B, which promotes growth, stimulates the appetite, aids the functioning of the digestive tract, increases resistance to bacterial infection, and prevents disease of the nerves. It is a good blood builder.

Asparagus as a Food

1. Makes an excellent cream soup.
2. Asparagus salad is made with tips placed in crisp lettuce leaves and held together with dressing of pimento or green pepper.
3. Serve with cream. Cut in pieces and cook a small amount of boiling salted water until tender. Drain off water. Add cream, heat, season and serve.
4. Serve with butter—May be tied in bundles, correct size for serving and cooked in boiling salted water until tender. Place each bundle on plate. Cut and remove string, and pour over softened butter.
5. Scalloped asparagus—Use cream or white sauce. Cover with buttered crumbs and bake.

Silence Is Golden

HAVE you ever tried the smooth little circles of metal that are called "domes of silence?" I much prefer them to casters on pieces of furniture. For many places the domes are far superior. They come in all sizes, some just right for the dining chair legs. You can't imagine how less awkward a chair is if equipped with dome of silence.

Each little fixture has four sharp prongs on the back that are driven into the wood like a nail. Once there and it stays, too. There is nothing about these useful domes to break, wear out, get out of order. They save strength and nerves of the home-keeper. They are much easier on rugs and carpets than casters or wooden chair legs.

Best of all they slide easily, never tear the carpets, and are very cheap. They cost but a few cents and for wooden furniture are ideal.

Mrs. E. M. Anderson

Baby Gifts

ISN'T it absurd to have a baby? I don't know that I could leave the vestment gray, that sorrows weave; I did not know that I could turn from pangs that scourge and griefs that burn; Until there came the month of May, And friendship brought a Hawthorne spray.

I did not know that I could greet Spring breezes, whispering and sweet; I did not know that to my ear The song of thrushes still rang clear, Until there came the balm of May, The hearts-ease of a Hawthorne spray.

Some tread the city's muddled maze, Some walk in lovely country ways, But may the King of Kindness send To each the blessing of a friend, The blessed tension of May, That whispers in a Hawthorne spray.

—L. Mitchell Thornton.

his little name-sake with a Liberty Bond. I know a farmer grandpa who likes to give a call to the new babe, and such gifts are indeed practical. Showers of little things are useful: baby soap, powder, safety pins, diaper garters, soft towels and wash cloths. These are never outgrown and may be as rich and dainty as your purse suggests.

Other appropriate gifts often not thought of: flashlight, hot water bag, thermos bottle, baby pan, bath apron, scales and the lovely baby blanket now so scientific and decorative.

C. A. T.

Hot Days and Sleeveless Frocks

No. 6553—Misses' dress. Cut in three sizes: 16, 18 and 20 years. An 18-year size requires 3½ yards of 38-inch material. To make capelet and bow of contrasting material requires 1 yard 39 inches wide. To make the scalloped edges with bias binding requires 6½ yards 2 inches wide. Price 15c or two for 25c.

No. 6826—Ladies' dress. Cut in five sizes: 36, 38, 40 and 42 inches bust measure. To make the ensemble for a 38-inch size requires 6½ yards of material 39 inches wide. Price 15c or two for 25c.

No. 6844—Ladies' dress. Cut in four sizes: 36, 38, 40 and 42 inches bust measure. To make the ensemble for a 38-inch size requires 6½ yards of material 39 inches wide. Price 15c or two for 25c.

No. 6845—Ladies' dress. Cut in four sizes: 36, 38, 40 and 42 inches bust measure. To make the ensemble for a 38-inch size requires 6½ yards of material 39 inches wide. Price 15c or two for 25c.

No. 6823—Ladies' dress. Cut in four sizes: 36, 38, 40 and 42 inches bust measure. To make the ensemble for a 38-inch size requires 6½ yards of material 39 inches wide. Price 15c or two for 25c.

No. 6829—Girls' dress. Cut in four sizes: 10, 12, 14 and 16 years. A 12-year size requires 2½ yards of 38-inch material. To make the ensemble for a 12-year size requires 4½ yards of 39-inch material. The width of the dress at the lower edge with fullness extended is 3 yards. Price 15c or two for 25c.

No. 6834—Girls' dress. Cut in four sizes: 10, 12, 14 and 16 years. A 12-year size requires 2½ yards of 38-inch material. To make the ensemble for a 12-year size requires 4½ yards of 39-inch material. The width of the dress at the lower edge with fullness extended is 3 yards. Price 15c or two for 25c.

HOW TO ORDER

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Send stamps or coin. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Address Pattern Department, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR That's why

FELS-NAPTHA GIVES EXTRA HELP WITH YOUR WASHING

Two HELPERS in a single bar—that's the extra help Fels-Naptha gives you.

Find it out for yourself. Unwrap a bar of Fels-Naptha and feel the velvety smoothness of the good golden soap. Then smell the clean odor that tells you it holds plenty of naphtha.

Naptha is a splendid dirt-loosener. And it's the combination of naphtha and soap working together, that makes Fels-Naptha give you extra help. Extra help that loosens even stubborn dirt and brings you fresh, sweet home-washed clothes—without hard rubbing.

In tub or machine. For soaking or boiling. In hot, lukewarm or even cool water, Fels-Naptha gives you this extra

help. Try it for household cleaning, too. Fels-Naptha loosens dirt so quickly that it gets your hands out of water sooner. Which, of course, helps keep them nice. Your grocer sells Fels-Naptha. Get some today.

FREE—a Fels-Naptha Chipper. Many women who chip Fels-Naptha into washing machine, tub or basin find it handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha) just as you need them. Send free and postpaid on request. Write today. Dept. 7-5-10 Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR
FELS-NAPTHA

Kill Rats Without Poison

A New Extremist that Won't Kill Livestock, Poultry, Dogs, Cats, or even Baby Chicks. K-R-O can be used about the home, barn or poultry yard with absolute safety as it contains no deadly poison. K-R-O is made of Squill, as recommended by U. S. Dept. of Agriculture, under the Connable process which insures maximum strength. Two cans killed 378 rats at Arkansas State Farm. Hundreds of other testimonials. Sold on a Money-Back Guarantee. Insist upon K-R-O, the original Squill exterminator. All druggists, 75c. Large size (four times as much) \$2.00. Direct if dealer cannot supply you. K-R-O Co., Springfield, O.

METAL ROOFING

CONSUMERS MFG. & SUPPLY CO. Dept. F. Moundsville, W. Va.

Cuticura Soap Shampoos

Cleanse the scalp and hair of dandruff and dust and assist in the healthy growth of hair. You will be delighted with their fragrance and efficiency. Send for Cuticura Soap and Shampoo with full directions. Address: "Cuticura," Dept. E, Malden, Mass.

WOOL—BLANKETS—BATTING—ROBES and colonial Coverlets. Made from your own wool. Also sold direct if you have no wool. Beautiful goods that give satisfaction and long wear. Write for catalog and samples. Prices reasonable. **WEST UNITY WOOLLEN MILLS**, 107 Lynn St., West Unity, Ohio

The trip to town

ON SATURDAY NIGHT the farm family drives to town. Boys and girls to the movies. . . Young fellows for a date. . . Dad and mother to purchase the weekly provisions.

But buying isn't such hard work as it used to be. It's a real pleasure trip, indeed. Goods come in packages and each sack or carton has a label. Mother knows what she wants. Father has his mind made up too. Under the farm account book at home they keep a "needed" slip. There all goods to be bought are listed. So are the brands to buy. Shoes, breakfast food, and syrup, gloves, tires, overalls.

If you're a practical farmer, you have learned that you can't spend valuable daylight hours gossiping at the crossroads store, or arguing with the grocer. You realize the advantages of reading advertisements, for you can trust advertised products and the stores that sell them.

The dealer who sells an advertised product does not have to resort to clever salesman's tricks. He sells his merchandise for what it's worth. He knows that you've had a chance to read about it, to compare it with other lines, to come to him with your eyes open.

Advertised goods have the public's approval. Accepted as standard, they remain on the market. Advertisers know that their products must be worth the money asked, or otherwise the public won't buy them.

GERMOZONE

The Life-Saver for Chicks

You cannot avoid the disease germs and bacteria that are picked up from the floor and droppings, you cannot avoid contamination from germ-laden little feet, you cannot avoid particles of spoiled or moldy food. But with a single teaspoonful of Germozone to the quart of drinking water three times a week, you can avoid the crop and bowel infection and diarrhoea that the germs and bacteria so surely bring on.

Each year increasing thousands of Germozone users save their chicks from this greatest danger. Leading hatcheries recommend Germozone, many public institutions and expert stations use it. **SAVE YOUR CHICKS.** A trial bottle, at our expense, will show you that your little ones can easily be avoided.

Give Germozone if your chicks already are sick. Use it for all sick birds.

At drug, feed and hardware dealers and chick hatcheries (one only at a time) postpaid, 12-oz. bottle, 75c. 4-oz. bottle, 25c. 1-oz. bottle, 10c. 51-pg. textbook on diseases, free.

GEORGE H. LEE CO., 1384 Lee Bldg., Omaha, Nebr.

Write to: Geo. H. Lee Co., 1384 Lee Bldg., Omaha, Nebr. Send big trial bottle Germozone. Enclosed find 10c to help cover postage.

Why Turkeys Die

Disease kills thousands of Turkeys. Vaccination and hygienic care will help prevent much of this loss, at a cost you can afford. Trial size \$1.00. 4-oz. bottle, 50c. 1-oz. bottle, 25c. **THE SYTAC CO.,** Division 113, St. Paul, Minn.

LOOK! PEKIN DUCKLINGS

Every Week, All Year, \$25.00 per 100. Extra fine quality. Live arrival guaranteed. Most profitable broilers known. Easy to raise—easy to sell. Weigh 4 lbs. in 8 weeks. **CATALAN FREE,** shipments appreciated.
NABOB POULTRY FARMS, Ave. R, Gambier, Ohio

Poultry Problems

Bronchial Disease

I have some chickens, one and two years old, that have been sick for about a week. They seem to have sore throats and are apparently blind in one eye. The throats are swollen and hard and the birds don't seem able to swallow any food. In the more severe cases the throats are filled with a yellow mucus which is very offensive. The bowels are loose and a yellow color.

M. C. Garrett.
Harrison county, W. Va.

It is quite possible that your fowls are affected with canker or at least some bronchial disease. It is well to remove the cankerous patches with a blunt stick and paint the sores with tincture of iodine. Give the fowls Epsom salts at the rate of one pound per hundred birds. This may be given in the drinking water or in a moist mash. Feed should be withheld for at least 12 hours before the Epsom salts are given.

It is well to use chloride of lime in the drinking water at the rate of two to three teaspoons per gallon in order to disinfect the water, since an infected bird will deposit germs in the drinking water and the disease will spread to healthy chickens.

A two per cent solution of mercurochrome may be applied directly to the affected areas if you prefer it instead of the iodine. This material may be purchased from the druggist. In the case of congested nostrils, it is suggested that mercurochrome be injected into each nostril with a medicine dropper.

The badly affected birds should be removed from the flock at once.
H. C. K.

Fertility

I would like to know how long I must wait to set eggs after I put the cockerels with my hens. How many should I have to 150 hens?
Mrs. Harry Reynolds.
Chester county, Pa.

In the case of a large flock of the light breeds and varieties of fowls such as the Leghorns, one male to 20 females should insure good fertility. Therefore, for 150 hens, approximately eight males would be required. In the case of the heavy breeds, one male to 15 females is recommended.

After the cockerels have been mated with the hens for a week or ten days, the eggs may then be used for hatching purposes.
H. C. K.

Salts for Chicks

Please tell me if you recommend salts for baby chicks. I have a neighbor who does and is losing some chicks.
Mrs. J. M. Brown.
Clinton county, Pa.

We do not recommend that Epsom salts be given to baby chicks. Nor do we think it is necessary to place anything in the drinking water as an aid in keeping chicks in good condition.

We have never been able to find any preparation which would cure the pullorum disease if it should be present in a flock of chicks. It is a better plan to purchase disease-free chicks. Less mortality and less worries will result.
H. C. K.

Buy Tested Stock

Would you please tell me what causes bacillary white diarrhea? Is there any cure and what would you use to disinfect a brooder house before you put a new lot of chicks in? I have lost nearly my whole flock of chicks with this disease.
G. H. Bernhard.
Montgomery county, Pa.

The pullorum disease causes a heavy mortality in young chicks. It has been our experience, and the experience of poultrymen throughout the country, that it pays to buy chicks from a breeder who has had his stock tested and the percentage of reactors has been found to be extremely low.

Many times one purchases chicks from a flock which has been tested and yet obtains poor results. The reason for this is because the original

infection was too great. It pays to buy chicks from a breeder who furnishes them from stock which has been found free or practically free from this pullorum disease.

The best method of treatment would be for you to clean the brooder thoroughly, wash and scrub the floor with hot water and lye and then apply a five per cent solution of a good disinfectant. This should put the houses in a reasonably sanitary condition.
H. C. K.

Experience with Gapes

Having noticed a request for remedy for gapes in the Pennsylvania Farmer recently, I would like to give our experience.

Plowing the soil and moving brooder houses may be a long time cure, but the permanent, but if the inquirer is most of us he wants immediate relief.

We had a flock of between three and four hundred stricken and since the only remedy I had heard of was the removal of gape worm with a horse dipped in turpentine, matters were surely looking serious. I happened to have an experience of a lady who had her chickens in a box, shook a like dose of air-slaked lime over them and then closed the box for a few minutes. We started at once, putting about 25 or 30 chicks in a box and using a very loose piece of cloth for a cover or shaker. Every chick was treated and about twelve needed the second dose. Not one died.

With my second brood, when I saw the gapes appearing, I went to the house one night while chicks were roosting and shook about four quarts of lime through the house and over the brood and closed it quick. It worked quite as well and was much less trouble. Not a chick died.

We have never had trouble of the kind since we moved from that place so haven't experimented any more. **Mrs. Clyde M. Grubbs.**
Lancaster county, Pa.

I saw in your paper of April 10 where B. H. B. wants something to cure gapes. This is what I used for my chickens and found it very good: One can use spirits of camphor, one can use camphor in their drink and put some hot water on it. I stand for a few minutes then fill with cold water. Put this where the chicks have to drink it and no other water. One can use spirits of camphor, I like the gum best. **Mrs. W. R. Swann.**
Clearfield county, Pa.

We had begun to think that gapes were not a problem on our chicken farm today, but apparently good many folks have found different cures for these parasites. Realizing I may be interested in what Swoope has to say regarding the cure of camphor as a cure for gapes, I have been one of the standbys for treating fowls with camphor. It can be used with results at a reasonable cost. To the chicks. Of course, the principal idea is that the lime causes irritation which ultimately causes the chick to cough and expell the worms.

According to A. L. T. Craven, county, Pa., the following remedy is good for gapes:

"Give a pill of camphor gum the size of a small pea. The camphor acts upon the worms by vaporizing them."

We have never tried this remedy.
H. C. K.

Heavy Feeding

I have lost several of my Leghorn hens by the vents turning out. It is mostly the pullets. They are in good flesh and are laying very well. I am feeding a good scratch grain and a couple of times a week adding a little salt with mash and about three pounds of mineral regulator and tonic in the mash. I have been feeding this for some time. These hens have been confined to the house since last November.
J. F. C. W. Clark.
Clarion county, Pa.

The trouble you describe is a common one, prolapse of the oviduct. There is good evidence of too heavy feeding of grain, especially corn, causes extreme fatness and by muscles, resulting in eversion of the oviduct during laying. This is as liable to occur in hens which

May 10, 1930

laying much or have started to lay at this time after loafing during the winter as in heavy layers, and perhaps more so.

To remedy the cause, cut down the grain, especially corn; give a dose of one pound of Epsom salts dissolved in the drinking water per 100 birds, and feed enough green feed to keep the birds in a laxative condition.

During the day will also help. The best thing to do with a layer with prolapsus is to kill her for food. Such birds should be re-housed from the flock at once, or the others will pick at the tissues and form the destructive habit of picking at sound birds.
R. L. S.

Unprofitable Layers

I started the winter with 100 pullets, 50 White Leghorns that were commercial chicks, and 50 hatched from a flock of White Rocks. They were in the appearing flock, but have proved very unprofitable as layers. They are healthy, have not had a sick bird in the flock.

Yesterday I dressed several for customers and examined the intestines. I found they are infested with both tape and round worms. Is there any help for them and if so what can be done? My poultry houses are stationary. We keep them as clean as possible, are not troubled with lice.

Mrs. G. M. Russell.
Lancaster county, Pa.

Having used a gizzard capsule for worming birds, which is a cheap individual treatment, but possibly not effective for tapeworms, and also like to cause a drop in production. The treatment seems to be the iodine

in the drinking water. Iodine is a disinfectant and especially dangerous to worms in flocks are ruinous to eggs and especially dangerous to young chicks. You must raise your young chicks in confinement or far from your poultry buildings and keep them away from the old birds you want to avoid trouble with.

Write to Pennsylvania State College, State College, Pa., for information on confinement brooding.
R. L. S.

Bone Development

I am having trouble with my little chicks. They will be all right and begin to chirp and droop. Look at them have lice or mites, but don't. The little wings will droop and legs will come out. They die in a few minutes.
Mrs. L. M. Boyd.
Frost county, Pa.

It is impossible to state the cause of the mortality in your chicks. Sometimes certain infectious diseases cause heavy mortality when chicks are young. Other times lack of proper development causes the chicks to be weak in the legs and die. To the care of proper bone development, the chicks need access to the direct rays of the sun or if this is impossible, use of cod-liver oil in the mash the amount of one pint to a hundred pounds is most desirable.

During the past few weeks there has been so little sunshine that it has been necessary for the poultryman to feed cod-liver oil in order that their chicks may develop properly.

It would suggest that you send some chicks to the Bureau of Animal Industry, Harrisburg, Pennsylvania, for diagnosis. This will be the best method of ascertaining the cause of mortality.
H. C. K.

It would suggest that you send some chicks to the Bureau of Animal Industry, Harrisburg, Pennsylvania, for diagnosis. This will be the best method of ascertaining the cause of mortality.
H. C. K.

Depluming Mites

What can I do for my chickens that have their feathers around head and neck? It does not look like molt. Is it the depluming mite? Do they stay on the chickens or so on the roost? **Helen Rhenius.**
Clarion county, Pa.

Four birds may be affected with depluming mites, which stay on them the time. An effective remedy is a part sulphur and five parts lard. Rub into the parts where the feathers are coming out.
R. L. S.

Turning spring-hatched pullets into profitable, early-fall layers

These pullets received Dr. Hess Poultry Pan-a-min from the day they were old enough to eat

TWO PENS of 98 pullets each. Both pens from the same brood of chicks. Both pens fed and handled alike. Yet one pen laid 539 more eggs in their first 5 months than the other . . . 539 fall and winter eggs that brought \$22.44. How would you explain this difference in production and profit between pullets of exactly the same breeding . . . pullets fed and cared for exactly alike?

Here is the answer. One pen received Dr. Hess Poultry Pan-a-min in addition to feed and care . . . received the minerals of Pan-a-min from the day they were old enough to eat . . . received the conditioning properties of Pan-a-min while they were growing and developing . . . received the balancing goodness of Pan-a-min right along with their laying ration. These two pens were divided for this experiment when they were day-old chicks and the pullets picked for the test

in the fall. Division made by experts, evenly as possible.

This is a typical example of several tests conducted with pullets in the last three years at the Research Farm of Dr. Hess & Clark, Inc. The combined results from all these tests show that you can profitably add one thing to the best of feed and care for pullets . . . Dr. Hess Poultry Pan-a-min.

Start your broods on Pan-a-min now. You'll be glad you did when the pullets start laying with the early fall. You'll be glad you did when your pullets have laid consistently for you all through their first winter . . . laid high-profit eggs and plenty of them. Dr. Hess Poultry Pan-a-min does not take the place of feed; but, as this experiment proves, no feed can take the place of Pan-a-min. Order from your dealer today. Dr. Hess & Clark, Inc., Ashland, Ohio.

PAN-A-MIN

A Conditioner and Mineral Supplement

Seeds of Ideas

ADVERTISEMENTS are selected seeds of ideas planted in the soil of your mind. If cultivated thoughtfully, these ideas will produce greater comforts and better methods of accomplishing your aims. These selected seeds of advertising can help you to live more fully at less cost.

The advertisements in this publication are a record of what the manufacturers are doing for you. They will give you many new ideas and will tell you what you want to buy. And they will help you get the most for your money.

The advertisements are news. They are interesting. Form the habit of reading them carefully and regularly. It will pay you to keep informed of the daily progress of business.

For full value—buy standard products. Manufacturers stand back of advertised goods.

FROM MILKING TIME TO MARKETING TIME

An insulated concrete tank is permanent, easily cleaned, always sanitary and moderate in cost.

- 1—It will conserve temperatures.
- 2—It will save ice.
- 3—Mechanical refrigeration can be installed in this tank.

Free Construction Plans

Blueprints and instructions for building an insulated concrete milk cooling tank sent free—use this coupon.
